- 27. Q. Do you know anything of these schemes?—No; they have not been before the Government in my time. They have been made out by Mr. Bodo from information and inquiries he made locally. I know of the proposal to raise the weir, but it has not yet been finally considered.
- 28. Q. Were there any proposals sent up to you for completing lanks or other irrigation works, which had been undertaken for famine relief?—We have been urged to complete two works, one in Sholapurand the other in Natik. The Sholapur work will cost its. 1,22,000. The present consideration is, what to charge it to. It will be partly for the water-supply of the Bari Municipality. At present, I see no justification for completing the tank as an irrigation work. We have asked for further reports on these two.
- 29. Q. Haro you any other works in other districts that it is desirable to complete?—For the present, we are a king for one lath of rapces in a lumpaum to be expended on such works, as it is considered desirable to complete. When we have decided which should be completed, we will apply for more.
- 30. Q. (Mr. Ibbetson.)—I understand that the whole of the water-rate is credited to Imperial Funds?—Yes, with a deduction for collection.
- Sl. Q. What proportion of the Land revenue? Three-fourths. I think it is three-fourths of the consolidated rate.
- 32. Q. You have two ways of realizing revente, one is a water-rate, and the other a land rate. Is total cess charged on the water-rate f-No.
- 33. Q. On the consolidated rate? —I cannot tell. If the cess is not realized by the Provincial Government on the water-rate, it is to their interest to charge the consolidated
- 34. Q. (Mr. Rajaratna Aldir.)—Local cess is not charged on the Nira Canal?—Yes.
- 35. Q. (Mr. Ibbeleon).—We have been told that the proportion of the lotal land revenue credited to nator should be higher than it is f—I have no intimate knewledge on the subject except as regards Sind. I do not know as regards the Decoun.

- 36. Q. You have just told as about the system of dobit which obscures facts as regards individual works. On a large number of new tank works, the working expenses ero shown as Its. 3 an nore all round; but, if the actual working expenses were taken, the charge would amount to Re 1 or Rs. 1-8-0?—No, the difference would not be so great. Only in some districts in the charge abarrmal, Its. 3 or Rs. 2-8 is more likely the figure.
- 37. Q. It is almost an accepted fact that establishment should be charged to tanks and protective works so as to relieve reads and buildings. Do you know of the existence of any orders to that effect?—The orders are that in a District 23 per cent. is charged to Provincial and the balance Imperial to Imperial and vice rersa. It is not possible for the Executive Engineer to make any difference; he has no power in the motter. It lies with the Examiner of Accounts, who makes the proper apportionment.
- 38. Q. You say all irrigation in the Presidency is Imperial, except the Gokak works; do you include the small tanks?—Yes, the expenditure on them is Imperial.
- 80. Q. You say that theiguestion of provincialization of irrigation is mainly one for the Finance Department to consider; would not the fact that the Provincial Government had a direct pecuniary interest in extending the efficiency of Irrigation works current more attention being paid to the works?—I do not think any more attention would be possible than is given now, whether the works were Provincial or Imperial. Our hands are tied by the maprofitable nature of the works. At present they may maintained at a loss. There is no difficulty in getting money that can be usefully spent.
- 40. Q. Is that the case as regards Miner works?—There is not much difference as regards grants for Major or Miner works. We certainly have no difficulty in regard to productive works.
- 41. Q. We have heard a good deal of talk about the failure of Government to fulfil its responsibility of clearing out the tinjarat rice tanks: if you had asked for money, would you have got it?—It was not a case of want of money. We never asked for large sums: we could have got more money.
- 42. Q. (The President.)—We were told that you never spent the rooney you had at your disposal?—There certainly recre difficulties in the way which I think were mainly due to the orders that preference should be given to those cultivators who made a 10 per cent, contribution towards the repairs of their tanks. There was no difficulty about spending the money. In some places tanks were not taken up till the cultivators said they would pay contribution and petitions were sent in. The works for those willing to pay the 10 per cent, were scattered over a big area. It would be easy caough to take up the trucks in one locality and finish them off, but it is difficult when precedence has to be given to scattered tanks willing to pay 10 per cent. It is not a fact that the dulay in the budget sanotion was any difficulty. When I was Supprintending Engineer, Northern Division, I knew the sanction would come and I gave instructions that money would be available and that they might assume accordingly. Same such order was made to the Executive Engineer, and I informed him of what the proposed allotinent was.
- 13. Q. (Mr. Ibbetson.)—Is the 10 per cent, rule a good one? Is it worth keeping up?—I think it ought to be done may with, null the rates increased to compensate Government, if necessary.
- 41. Q. With regard to the Chankapur Tank, the interest charges are almost as much as the Capital outlay, the figures being Rs. 60,000 cost and Rs. 49,000 interest, can you tell us the cause?—I canuot loll at this moment. It was sanctioned and under consideration before I became Ohief Engineer.
- 45. Q. We have been told by the Executive Engineer for Irngation, Poons, that he has no knowledge of the fluorelat results of his work, largely on account of the artificial establishment charges ?—I have always considered that no Executive Engineer should judge the result of his work by the number of nores irrigated; the more irrigated the botter.
- 46. Q. Is credit given to the Excentive Engineers who obtain the best results ?—The Excentive Engineers are given credit for it in the reports.
- 47. Q. Supposing one man has a small area of high paying crops, and the other a greater area but low paying crops, the area would not be the correct measure?—No.

Mr. John. Tate.

Mr. John Tate. 21 Dec. 01

- 4S. Q. Do you think it would be feesible to reconstruct the Irrigation Department in the Bambay Presidency ?—I certainly think that in Bombay we should have a Chief Engineer entirely for irrigation, one man cannot properly look after the whole Presidency.
- 49. Q. From the lessone of the past five or six years, do you think there should be some separation. —I think same relief should be given to the presont staff. If the department is entirely separated, the cost would be enarmans. Temporary separation may be made, while works are heing carried out; but I do not think that the existing irrigation works are sufficient in number to justify sutirely coparate Excentive establishments.
- 60. Q. Have famino programmes been prepared for all districts liable to famina?—We have been living from hand to mouth an existing programmes; but we have made new programmes as far as possible.
- 51 Q. Are there any districts in which famine has not occurred, but for which programmes were prepared?—Yes, the Konkau. In the Konkau there has been no famine for the past five years.
- 52. Q. Havo the Konkan programmes been revised lately?—Yes, at the beginning of the last famine. I think they are nevised every six manths.
- 53. Q. Is the Forest Department concentred as to whether they could eaggest famine works?—Yes, certain forest works are included in all the programmes.
- 54. Q There are large forests and alariginal tribes in the K kan?—Yes, but they were not affected by the distress.
- 55 Q. How are the repairs of the small tonks in Gujarat carried ont; are they repaired?—We do repair them from time to time, when the Executive Engineer has decided which of them are to be repaired. He is ordered to review them every five years or so, and report on their state.
- 56. Q. Mr. Lawrence told us that there was a proposal to legislate in order to compel the people to keep these tanks in repair?
- Mr. Muic-Mackenzie: -That proposal has been aboutdoned for the present.
- 57. Q. (Mr. Rajaratna Mdlr.)—You refer to the subject of making the Irrigation Department separate, how many Seperintending Engineers have you got now?—Five, excluding special men.
- 58. Q. Considering the small number of men on Irrigation works, would it be possible to reduce the number and put some on irrigation projects?—I don't think so, as the Eogineers in some instances have local works as well as irrigation to superintend.
- 59. Q. I want to know if you can make three Divisions and spare two officers?—No, it is quite impossible. We have two officers in Sind where we had formerly only one. And they have quite ns much as they can do and race.
- 60. Q. As regards tank works, you said you had no difficulty in obtaining money for repairs. We find that very little money has been spent in the last 25 years in regarding these minor tanks in Gujarat. Why, so the money was available, was so little spent on their repair?—I don't man that we could get an unlimited uncount of money. We get what we wunt, but we have difficulties in epending it.
- 61. Q. In Mr. Beale's report, the working expenses as givan are said to be fictitious?—They represent a share of the actual establishment of the district calculated on the 23 per cent. basis for provincial works.
- 62. Q. How does it compare with the actual expenditure?—There is no way of finding out. The Examiner takes the total expenditure of a district. If it is an Imperial district, he dehite 23 per cent. to Provincial, and dehits the rest of the expenditure to Imperial.
- ${\it c3.}$  Q. Is there no record of the actual expenditure on irrigation  ${\it P-Nu.}$
- 64. Q. (Mr. Muir-Mackenzie.)—It is a generally accepted union that protestive works should be unnaged by reserving a certain percentage of the water for fool crops?—Yee, but I have no special orders that I can point to.
- 65. Q. The particulars of such works have been submitted to the Gavornment of Iudia P—Yes, the Nira project was prepared with the intention of ite being managed as a protective work. There was a trait understanding with the Government of India that the Nira Canal would be werked as a protective work.

- Mr. Higham.—You cannot produce any Government Resolution in which these orders were cantained, and I am sure that na such restrictions were intended or conveyed by the Government of Iudia.
- Mr. Muir-Mackenzic.—I do not wish to ergue the paint, hat that is the fesling on the cubject.
- The President.—If the Bombay Government think that they are tiad down to that view, I would suggest that they shauld communicate at once with the Government of India.
- 66. Q. (Mr. Muir-Mackensie.)—In regard to the Maladeri tank, how lang have the plane been with the Superintending Engineer?—Not very long. We kept them hach a little as a matter of fact, as I wanted to lay them before the Commission, which wa thought was coming here earlier. We found that the figure had not been eigened by the Superintending Engineer, and same information was wanting and so they were sent back to him.
- 67. Q. (The President.)—You may be earethat, if it has a good reservoir, the scheme will be backed up by this Commission?—It is a good scheme; the only question is, whether it will pay.
- 68. Q. (Mr. Muir-Mackenzie.)—As regarde the completion of wark began in the Fumine, should not nil the warks be completed which would pay interest and warking expanses on the cost of work necessary for completion?—You have to put in the finnine labour.
- 69. Q. Leaving ont the famine labour, would they pay interest and the working expenses?—I can see no abjection ta that except, that it will leave na work for a future famine. If thay would pay interest an the further capital expended, I think it will be a wise plan to complete them. But having regard to their protective value, I da not think it would pay to complete them, if they only pay their working expenses.
- 70. Q. If any irrigation work does good to the villages close to it, there can be no doubt that the villages under its influence are better prepared to resist famine. It has a protective affect upon the villages. We have to bonsider that protective effect; it is not a question of money, i.e., whether it would pay or not ?—It is difficult to estimate the protective value of works. In selecting works, we expect that they will ut less pay their working expenses; hat I doubt if the protection is worth the money in many cases.
- 71. Q. With all the experience you have had with regard to famine labeur, do you think there is any better way of employing it than ou tanks and canals?—I think metal breaking is decidedly inferior. Tanks, whether they pay or not, are better. The metal broken may not be of any use: the tanks always will be of some.
- 72. Q. Do you see very much scape for road-making with famine inbour?—No doubt, many roads could be made, but where is the maintenance to come from.
- 73. Q. Many of the roads were made in old times before the railways were built; could not new roads be made to feed the railways, and the old ones be abandaned?—That is a point I have not considered.
- 74. Q. You said to Mr. Ibhotson that we'had been living from land to month with regard to finalise programmes, would it be worthwhile, oven at considerable expenditures to have programmes of tank works prepared with full plon, and estimates sanctioned, so that, if a future fuming came upon upon upon upon upon the work could at once be undertaken with famine labour?—I think special urrangements will be necessary to prepare programmes for future famines. Before the last fumine, the Public Works Department was just recovering from the effects of their work in connection with the famine of 1836. Varians proposals were made. It was proposal that an Executiva Engineer should be put on epecial duty to complete projected works, but before unything could be done, the last famine came upon us, and we had no time to do it. I consider it very necessary that we should, in future, have a special establishment to prepara famine programmes. Without this, I do nat see how it is to be done.
- 76. Q. De you think that irrigatian works require special consideration?—I consider it a class of work to which preference should be given.
- 76. Q. You think the programmes when made should be carefully examined?—Yes, it is very impartant; but the question of cost has to be considered. At present the ent of survoye is dehited to ordinary fauls, and not to famine relief.
- 77. Q. You have at present an Engineer carrying out epecial surveys. His services will have to be charged to

irrigation, but you will have to get a special grant before you can do that?—I cannot charge his services against 83, all his expecditure is charged to 85.

- 78. Q. (Mr. Ibbetson.) Has not the Secretary of Stat ordered such survoys to be obarged against famins (No. 35)?
  —No such orders hove as yet been received by me, but I have heard that there is such an intention.
- 79. Q. (Mr. Muir-Mackenzie).—There are other charges too, for which we have to go to the Government of India?—At present a list is being prepared which shows that S or 4 lakks are required for hand compensation tharges, partly for irrigation and partly for roads and railways. The Local Boards have no funds to meet their share.
- SO. Q. It was suggested by one of the papers that there was unnecessary delay in taking up land. When you have definitely decided on a certain site for a famine project,

why not take it up at once and re-lot it to the late owner, so that there should be no delay in starting the work when necessary ?—I have not heard of any delay, if there was ony we could meet it. There could only be 15 days' delay, as notice under the emergency chanse of the Land Acquisition Act empowers us to take it up at once.

81. Q. One of the witnesses soggested that the land should be token up at once as it might go up in value. What do you think of terracing the country with thats:—I suppose you meen Mr. Joyners' proposel. Yes, it was considered; but it was thought that for large works under the Public Works Department, it was undersirable, os the lobour on it would be difficult to control, and there were other difficulties which prevented the Public Works Department from toking it up. It would be good work, if you could get over the promistary rights. be good work, if you could get over the proprietary rights of the people.

Mr. John

# WITHES No. 62 .- Mr. K. R. Godnote, Excentive Engineer, Public Works Department.

### Answers to printed questions,

I am now on long leave, and connot therefore make any official and lacel enquiries and obtain the requisite detailed official and lacel enquiries and obtain the requisite detailed infernation for answering the questions proposed by the Indian Irrigation Commission. I have also no ules, returns, reports, or statistics to refer to, and will therefore give below such general information about irrigation in Shelapur district as I think likely to be useful. My evidence will relate mainly to the Shelapur district, where I was working as Executive Engineer in charge of the district for Olycais before I availed myself of my present leave. Detailed information regarding rainfall, present and proposed works, irrigation distribution and control, crope, waterings, outturn, cost, etc., while forthcoming from the written and oral evidence of the present Executive Engineer of the Shelapur district. Sholapur district.

- 2. The Sholopur district is situated in the dry zone of the East Decran, and is one of the first districts in the Bomby Presidency to be affected by famines and seasons of scarcity. Its rainfall is prorations and uncertain. Very often it fails at end of the khorif and rabl seasons. Such failures tend to the partial or total failures of crops, and bring on seasons of famine and distress.
- 3. The culturable soil of the district is mostly peor, being a top-layer of bronu or black clay averlying muram and rock below. The top-layer of brown or block soil varies from 3 inches to 2 feet in depth. On the banks and in the valleys of anna and rivers the soil is rich block, but the exlent of such land is not considerable.
- 4. The district is troversed by the Great Indian Penhisula Railway, and there will be soon another narrow gauge line between Paudharpur and Kizam's Frontier vid Barsl Towa. There are good means of intercommunication by roads also. There is no immediate necessity of farther road communication in the district.
- 5. The only means that remain to be token up now for protecting the district ogninst fornines and seasons of scarprotecting the district ogninst foning and scarns of scar-city consist of the development of irrigation works. These should be extended as far as practicable. There are two rivers in the district, namely, the Bhima and the Seens. But they are not favourable for conal irrigation, as the water-supply in both is not perennial. The river bunks are also much broken up by high mutam ridges which approach almost to the liver edge at short distances aport. Such con-ditions are not favourable for nickens weigh with consisditions are not favouroble for pick-up weirs with causle starting from the same.
- 6. It may perhaps be precticable, however, to construct a weir on the Nira river below its confluence with the Kara river, and take a left bank canol from the same for irregating the Maksiras taluka of the Sholapur district. The canol will pick up the waste water of Kira Canal after it has done its duty. The discharge of the Nire river at the site of the proposed weir will probably be considerable, even in the hot weather, on account of the construction of the Bhatghar Reservoir and the poremulal trigation on the Nira Canal. I throw out this suggestion for further consideration, and for development of the project, if the sorns sideration, and for development of the project, if the some be found to be fersible.
- 7. In the absence of perennial rivers in the Sholapur district, the only closes of irrigation works practicoble are irrigation tanks and wells. Four irrigation tanks have already been constructed in the district, all of which have been foirly successful. They have more than paid their working expenses, and have been the means of roising large

quantities of food stuffs and fodder in years of scarcity and famine. In ordinary years they have been the means of raising high class and paying crops. The growth of these crops has mised the stotus of almost all irrigators. All the irrigating villages under the tanks have theired, and become almost nucleondent of Government assistance in times of famines and distress. times of famines and distress.

- 8. I strongly advocate the construction of as many irrigation tanks as practicable in the Sholapur district. The only conditions for tank works undertuken by the Stote should be that the entchment area should be not less than should be first the entchment area should do not less vann 12 equare miles, and that the fank when completed should at least pay its working expenses. Tanks with large catchments should be given preference first. But in the absence of sites with large catchments, I would occept smaller catchments rather than not construct the tanks. There is a considerable number of sites in district with catchments of the convey miles and upwards. catchments of 12 square miles and upwards.
- 9. In years of scarcity and insufficient rainfall the tank with smaller extchments will not fill, but the direct and indirect advantages derived from them in ordinary rainfall years will more then compensate for this drawbock. Even in bad years the tank will hold some water which can be very profitably used in the saving of the ordinary khorif and robi cultivation under command. It frequently happens in the Shelapur district that ordinary kharif and robi crops thrive well in their initial and middle stages, but wither and are lost for want of one or two raiofalls in the cud. Such crops, if under commend of the irrigotion tanks, I advocate, will be saved by giving one or two waterings for the tanks. The stored water required will be small, but the value of the crops saved will be very great. 9. In years of scarcity and insufficient rainfall the tank
- 10. I give below the several advantages that will be obtained by the construction of the irrigation tanks I refer
  - (a) In ordinary rainfall years all the tanks will fill ond carry out the objects for which they have been designed. In very bad tainfall years the tonks with smaller entelments may not fill, but even in these years they will hold some water which can be most advantogeously and profitably used in the soving of ordinary pharif and rabi crops under command by giving one or two waterings.
  - (d) The tanks will be useful for water-supply for men and cattle. This is a great desideratum in a dry district like Sholapur.
  - (c) They will raise the sub-soil water-level of the ndjoining country. This raising will extend all round the tank nurgin and for 4 or 5 miles below the tank dam. This will be a great advantage for lift irrigation by mean s of wells.
  - (d) Large and thriving plantations of babul wood and other fuel trees will spring up round the margins of the tnuks. This will be a source of income to the State, and will increese the Inol supply of the district.
  - (e) The protected vilinges under the tank will become independent of Government assistance in times of famine and distress. The condi-tion of the irrigators will improve to such an

Mr. R. R. Godbole.

Mr. K. R. Godbols.
21 Dec. 01,

extent that they will not resert to Government relief works, or ask for other help from the State in times of famine.

(f) The tanks will provide a considerable extent of grazing round their margins and on cannis for cattle in the neighbourhood.

11. In tracts where irrigation tanks and oanals are not practicable; the construction of wells should he freely encoraged. The wells should first he excavated to waters beering strata and enlarged if successful. Government should not attempt constructing wells hy their own agency in private lands. The construction should he left to the holders of the lands themselves, who very well know how and where to construct the wells. Government assistance should be confined to unking "tagai" advances on as easy terms as practicable to the using of derricks and boring instruments, and to the undertaking of dynamite blasting when required. The using of boring upparatus and dynamite blasting can be carried out by Government or Local Boerd professionel agency at the expense of the agriculturists concerned.

12. An irrigating well in the Sholspur district, capable of working one "mot," with a masonry pletform for one "mot" only, can be constructed at an average expenditure of Rs. 300, and it will irrigate about 3 acres all the year round.

13. The only income obtained by Government at present from the irrigation works is from the sale of tank and cannl produce and from the sale of the tank water. The lands under command have the great advantage of being protected by the irrigation work, that is in a season in which the rainfall is insufficient and untimely, the occupant her got the great convenience of taking cannl water and of saving his crops. He pays for the water when he takes it, but for the potential advantage that his land enjoys on account of the construction of the Government irrigation work, he pays nothing. In revision settlements, the Settlement officers will probably cahance the land assessment on account of the irrigation facilities and protection herein referred to. If there is such an enhancement of reveaue, due to the construction of the Government irrigation work, the work shanld, I thunk, get a book credit for it. This is a matter that is worth consideration during revision settlements.

ments.

14. The present system of ascessing revenue charges on an irrigation work is, I think, faulty. The correct system would be to take the actual cost of repairs and maintenance, ond to add a certain fixed percentage to it for cetablishment charges. The porcentage should be 12, being the same as debited to Local Board works. Instead of such a procedure the revenue accounts of irrigation works are debited at present with very heavy establishment and book charges, and the result is that the works are shown as not paying, or as being worked with a loss. The rules on this subject should, I think, be re-considered.

15. The demnnd for water in deep black soil is generally much less than in the case of other soils, and in ordinary rainfall years the black soil fields require no assistance from irrigation works, so far ns ordinary crops are concerned. In the Shelapar district, however, irrigation is sought after for all kinds of soils whether rich, black or light. In black soil plains it is required for the irrigation of sugarcano, fruit-trees and other valuable crops. The Shelapar people are auxious to obtain water for irrigation purposes everywhere. But in black soil areas it is not likely to be used to the same exteat as in the case of the other soils. Preference should be given therefore to the command of lighter soils in selecting sites for irrigation

16. Small tanks constructed in black soil oau hold water like other tanks in the district, if sufficiently deep puddle trenches are provided below the impounding dams. High dams cannot be made of pure black soil. There should be an admixture of maram or red or yellow earth with the black soil, the dam materials will swell with rain and moisture, and the swelling will lead to cracks and slips. The earthen dams in the Bemhny Presidency are made of mixtures of black soil ond muram and covered with a casing of maram on all exposed faces. No masonry core walls are necessary for earthen dams, if edequate concrete and puddle trenches and drainage gutters are provided under the dams for preventing leakage and water-logging.

·17. There are no villago irrigation works in the Sholapur district like the bandhoras in Nasik and Khandesh and the irrigation tanks in Dharwar and the Southern

Maratha Country. It is desirehle to have such village works hut I do not think there is any chance of their bong constructed in these days, as is it impracticable to get the villager to co-operate to the requisite extent in getting ap the required funds, and in abiding by the rules regarding the up-keep and repairs of the works when comploted. A large private land-owner may consistently come forward to construct a small tank for a hhandhara and channel. If such a man comes forward, he should be freely encouraged by Government to carry out the work by giving him facilities for acquiring the required land and for collecting reuts for water which he mey give to other cultivators.

18. I nm not in favour of constructing small village tanks in the Shalnour district, naless adequate arrangements are made for their np-keep and meintenance. Some tanks of this character were made in the famine of 1876-77, hat most of them here broached and ere now in ruins. That works caanet irrigate lands, but they will be useful for water-supply for washing and village cattle. They will also raise the sabsoil water level of the adjoining lands. The only ungousy that can be entrusted with the repairs of these village tanks is the District Local Board, but that body is too poor to undertake this additional responsibility. The Board can hardly get the required funds for keeping up the district reads in repair. I am afraid that under these circumstances the village tank construction must be shoudened. The works are so small and of such limited utility, that it is not desirable to expend any Previncial or Imperial Funds upon their repairs, oven if they are constructed from famine funds. The village tanks will generally dry up in the Sholapur district at the ond of January, and they will be empty in the lot weather when they are wanted most.

19. There are no obstacles to the extension of Irrigation in the Sholapur district arrising from scanty population, insufficiency of cattle, unsuitability of the soil, lack of capital for initial expenditure or other reasons. There is want of manare in outlying villages, but this want will bave to be applied, as irrigation progresses by importation from outside. There is a good deal of night-soil, poudratte and other good manare available in the neighbourheod of cities like Sholapur, Paudhorpur, and Birsi.

20. Extension of irrigation will have no teodenoy to injure the remaining coltivation of the district by drawing away copital and labour from the latter.

21. There are complaints under the older irrigation works in the district of lands heing improverished by constant irrigation, but this is due to want of maunre and want of rotation. The same hand is often irrigated year after year with similar crops, and impoverishment is the consequence. There are no other complaints regarding damage to irrigated lands or to the inhabitouts of irrigated villages.

22. No drainego works are required in the Shelapur district, as the whole of it is noturally well drained by unlas and rivers. There is no water-legging or had thrown out of cultivation on its necount. In prigoted are a slate there is no necessity for drainage, as the lands Irrigated mostly have marked at a small depth for their sub-soil.

23. The famine relief works carried out in the Shelapur district in 1896-97, 1899-1900, 1900-1901 famines consist of

- (a) Roads, road repairs and improvements and metal collection for roads.
- (b) Earthwork for now railway lines and ballast collection for existing railways; and
- (c) Construction of irrigation tanks and repairs of existing irrigation works.

Fortunately in the last two out of the three famines the bulk of famine works expenditure was on closecs (5) and (c) above.

The following six new tank works have been started as relief works in the Sholapur district and are still incomplete:—

- 1. Budibol Tank.
- 2. Bhamburdi Tank.
- 3. Pathri Tank.
- 4. Wadsbivno Tank,
- 5. Hudgi Tank. .
- 6. Maagi Tank.

Of these, I strongly advocate the early completion of the first 5. If completed at an early date they will add to the irrigated area of the district and protect considerable area from droughts and distress consequent on seasons of

soarcity. Nos 3 and 4 (Pathri and Wadehivno Tanks) must be completed before next raine, as their feeder nelas have been builded up, and temporary waste weire have been provided instead. These temporary waste weirs will develop into river-bods next rains, if not immediately closed and rendered unnecessary by the completion of the works us designed. Nos. 1, 2, and 5 are very useful works, and should be completed at an early date. No. 6 (Maugi Tank) is a useful work, but unfortunetely the area nuder its command is limited. Its completion can therefore wait until the completion of other more remunerative adhemes. six tank works under reference will much more than pay their working expenses when completed.

24. The water-rates charged are crop rates which are sanctioned by Government from time to time on proposals submitted by local Irrigation and Revenue officers. The sanctioned by Government from time to time on proposals submitted by local Irrigation and Revenue officers. The scales of water-rates are generally fixed for three years. The areas of irrigation of crops are accessived and assessment returns prepared by the Irrigation Department twice in a year for the kharif and sabi seasons. They are then sent to the Revenue officers for callection of irrigation revenue along with land revenue. Water applications are received for the crops to be grown, and when sanctioned water is given to the irrigators mutil the crops mentioned come to

maturity. The distribution from the main and branch canals and from larger distributaries is in the hands of Irrigation officers. After the water leaves the main canal and branches, the irrigatore manage the distribution amongst themselves according to tarns fixed by the Irrigation Department and under sapervision of Irrigation officials.

25. In years of favourable and timely rainfall, canal water is not taken fer ordinary kharif and rabi crops, and the extent of irrigation and irrigation revenue fall in conseextent of irrigation and irrigation rovenue fall in consequence. In years of good and timely rainfall it cometimes happens that the storage in larger tanks is not fully utilised in irrigating porennial, eight months', and hot weather crops. Some of the stored water remains in the tank for use during next year. In the case of the Ekruk Tank some witer has always to be specially reserved in the tank ut the end of the year, as the water-supply of the town of Sholepur and of the factories established in it is dependent upon the tank. Any year may turn out to be a had and rainless year which may not bring any replenishment into the tank. year which may not bring any replenishment into the tank. To gnard against the contingency of such a year, it is necessary to keep sufficient water into the tank at the end of the year to meet the water-supply wante of the town doring the succeeding year.

- 1. Q (The President.) You are an Executiva Engineer, Public Works Department? Yes; I am now on leave. I have been eix years in Sholapar. I was there on duty I have been six years in Sholapar. I was there on duty during the last famine. I have been 23 years in the Department, and remember the famine of 1877.
- 2. Q. Much of the Scholapar district is irrigable by tanks and wells?—Yes; but these tanks generally depend on local rainfall. When the smaller tanks heve been dry, I have seen the larger ones holding water, even in a year of bad minfall. I say this from my experience of the last two years. of the last two years.
- 3. Q. With regard to wells, Government assistance would be confined to making takevi advances: do you think the torms should be made endor? I would propose a longer period for replyment. I would make it 30 years, and toperiod for repayment. I would make it 30 duce the rate of interest from 5 to 4 per cent.
- 4. Q. Supposing a wet assessment was put on the well instead of saking for a return of the takavi "-I don't talak the people would like that.
- 5. Q. Not even if they got the money for nothing without interest?—No.
- 6. Q. Is there much difficulty in sinhing wells in your district?—They are easily made; but it is difficult to get water, because the soil is 2 or 3 feet thick; below that there is murum, and below that again ruck. You have got to get to the heart of the rook and to a soft layer.
- 7. Q. What does ench a well cost? About Rs. 300; but if the water is found soon, much less.
- 8. Q. Those are kachcha wells !- Yes. They last for 80 or 40 years with slight repairs.
- 9. Q. In paregraph 14 of your note you refer to the present system of establishment charges?—Yes, the cetablishment charged to irrigation works is too high. The maintenance charges are also high, too high. Ordinary maintenance of irrigation works does not require much professional and the profession works. sional knowledge, and could easily be entrusted to a lower paid establishment.
- 10. Q. You say that in the Shelapur district, irrigation is used for all kinds of soils. How deep is the thick black cotton soil?—Near the rivers, and nalas 8 or 10 feet; in other places 2 or 3 feet. When I say all kinds, I mean ovon for sngar-cane.
- 11. Q. In paragraph 18 of your note, you say thet you are not in favour of small village tanks in Shelapur, unless adequate arrangements are lande for their up-keep f -Yes, aomo amall tanks in the Sholupur district wore mado as famino works, and are out of use; some have been breached on account of insufficient waste roirs. The tanks were constracted, and no one was placed in cherge of them; they were chiefly for cattle and drinking water purposes.
- 12. Q. Do you think motal broaking a good form of famine relief?—No, not unless the metal is really required for roads, and you can use all that is broken.
- 13. Q. With regard to the four tanks referred to in your note—in bad years they would not fill, but in good years rould they fill?—They are not situated on perennial streams, and we cannot connect them with the glats, as Shelspur is on a high plateau. I think they would not all in very had

- 14. Q. (Mr Higham.) You say that the Bhama and Seems are not feasible for causls, as the water supply is not perennial; the Bhemn comes from the ghats, does Ves; but even if storage reservoire were put up, the weter would have to be carried 100 miles down the Bhoms, and in traversing that distance half of it would be lost.
- 15. Q. The Bhema is rocky in some places, and sendy in others; do you know whether there is rock under the sand?—I do not know. It gots dried up during the hot weather; the supply falls in April or May, though sometimes it flows perennially.
- 16. Q. Why do you say half the water would be lost in transit to the count?—As Assistant Engineer. I took observations of the Pravara river in connection with the Maladeri tank, and I found that in about 40 miles there would be loss of 25 per cent.
- 17. Q. Is that ou record P-Yes, it is most probably filed with the other records.
- 18. Q. Do you know of any other observations of a similar kind?—There were similar observations in regard to the Bhntgarh tank on the Nim canal. I have not taken observations in regard to the Bhema
- 19. Q. What about the Scenn?—That has its rise near Ahmednagar. The country in the Shelapur district is most uninvourable to irrigation. There are ravines round about, and outting would cost a los, while the area commanded would be smell.
- 20. Q. Could not high weirs be adopted?—On the Seena river I tried to get altes for pick-up weirs, but could not get any. The banks of the river vary from 10 to
- 21. Q. You s uggest that the waste water from the Nira might be picked up, how do you know that there is nny?—There is bound to be was water, as the water must retern to the rivers. I have taken no observations. I took some observations in Khandesh, where we have the Panjra interestion. It consists of a number of weirs seale of which irrigation. It consists of a number of weirs, each of which irrigates a small block. Wo let the water out to feed the land under the bandharas, and it comes back to the river.
- 22. Q. Cao you say from your own knowledge that there is waste water ?-I cannot say.
- 23. Q. You say you would not make tanks with less than 12 square miles extehment?—You, the cost of construction is smaller with larger extchments.
- 21. Q. But the larger your estelment the larger the capacity of your tink?—Yes; but if we atore a small quantity of water in a large tink, there will be mach less from evaporation. It is heavy in Shelapur, about 5 or 6 feet in the year. If you have a small tank, the spread is
- 25. Q. Supposing you design a tank to hold 100 willion onbio feet and you have a cortain catchment area; if you have abort min, you got only 50 million ouble feet; and if you have a smaller tank, you got only 25 million f—That woold depend on circumstances.
- 20. Q. I imegine your objection to small tanks is that the cost of storage is greater compared with a large one? You say that if you make these tanks, the villages in the vicinity will become independent of relief ?- Yos, we

21 Rec. 01.

- Mr. K. R. found this to be the cass under the Ekrek, Ashti, and Godbole. Koregaam touks. In regard to all these, the villagers came in, but in very small preportious.
  - 27. Q. You mean; some came in, but not the oultivator class?—The cultivator class cams in when the famico had reached a serious stage and the tanks ran dry.
  - 28. Q. The big tanks, as a matter of fact, did a ot fail in their supply ?—Only the Koreganu failed. It has a catchment of hre square miles. Vsry few enlivators from there weut on relief works.
  - 29. Q. Supposing new wells were made, do you think ley would be worked regularly or only in famine times is they would be worked regularly.

    They would be worked regularly.
  - 30. Q. Whot is the average lift?—The average lift would be about 25 test.
  - 31. Q. Are the people deterred from building wells by the first cost of construction?—Yes, in the poorer talakas.
  - 32. Q. But the people depend on the ordinary rainfall?
    On the ordinary rainfall and wells; they would work wells if they had them.
  - 38. Q. You think the cost of maintenance might be reduced?—Yes, I would devise sums means by which the establishment would be reduced. I would had over some of the works to the villagers.
  - 34. Q. In the Sholapur district, your establishment charges are small?—In Koregaum the revenue and expendituro are about the same.
  - 35. Q. You say carthon dams can be made 70 or 80 feet high?—The Ekruk dam is 76 feet high, but it has slipped in places. The sub-soil gets water-logged whom the drainage is technical. The Asha tank is also giving trouble, which 18 dun to the same cause.
  - 36. Q. Have you any earthea dams that have not given trouble?—Almost all hove given trouble.
  - 37. Q. In regard to villago tanks which you do not recommend, are there not some worth repairing? Yos, they would make good famine relief works.
  - 38. Q. The soil of Shelapur, what is it like?—The soil is mostly brown light soil; it overlays a bed of muram.
    - 39. Q. Is it permeable to water?-Yes.
  - 40. Q. With regard to the tanks which, you say, might be finished as they are half completed, what are they?—
    The Pathri and Wadshivuc.
  - 41. Q. You have had famino labour employed on these tanks for nearly two years ?—Yes, as many as we could get. On the Pathre we could have taken more, but the famine was not severe there, and we had less labourors.
  - 42. Q. Supposing you had ordinary laboar and put as many mea on as you had famine labour?—The smaller works would have been faushed.
  - 48. Q. Do you think that from the local villages, from which labour came, the men would have some to work for a contractor?—No, in ordinary years tany would not have come in sufficient numbers to complete the work. Even professional labour would not have been sufficient to make any material progress with all the tanks.
  - 44. Q (Mr. Ibbetson.) You say in your memorandum that tauks will affect wells for 4 or 5 miles?—I have noticed that not only close to the mila, but within half a mile on both banks.
    - 46. Q. In famine years do they benofit ? Yes.
    - 46. Q. How far?-Within half a mile.
  - 47. Q. I understood you to say that tooks do not pay the interest on their oust; that they just cover working expenses and some pay I per cent.?—The new tanks will only pay their working expenses.
  - 48. Q. These tanks which are half finished by famine laboar, if the cost of the famine labour was set eside, would they pay on what it would cost to finish them with ordinary laboar?—Ethelently worked, they should return 4 per ecut.
  - 49. Q. Where you have got to hold up water, is the demand in oxcess of the supply?—In a good year the water is in excess of the demand. In had years all the water is
  - 50. Q. In good years they ase the water for sugarcans P. sensonable.

- 51. Q. How many years out of ten would they take water for rabi crops?—Every year they take some, but ie bad years the acreage is larger. Last year was the largest on record. It was a bad year of rainfall, and we used up all the syster except in the Ekruk. We used up all the water in the Mhaswad tank also.
- 52. Q. Of the latter, 25 million cubic feet was seet to Pondhurpar?—Yes, there was cholsra there, and we were asked by Government to supply the town with water. We could have need it for irrigation.
- 53. Q. (Mr. Rajaratno Mudaliar.) 1s the Mhaswad a protective work?—Yes, we are obliged to hold up water.
- 54. Q. Generally a large quantity of the water is not ntilized?—We supply all domaeds, still a quantity remoins over.
- 55. Q. Do you know that the working expenses are Rs. 18,000 and the revenus 1s. 19,000, that is the average for ten years?—That is due to book charges; I don't think the actual cost of the maietenance is Rs. 5,000; the budget elletment varies from Rs. 5,000 to Rs. 6,000. We maintain ellotment varies from Rs. 5,000 to Rs. 6,000. no special establishmant there.
- 56. Q. What does the maintenance staff of the district at ?-1 cannot give the exact figures, ubout Rs. 2,000 n month.
- 57. Q. With regard to Koreganm and Ashti, the water is sofficient to irrigatu the whole area P.—The command area is always greater than the actual area irrigated.
- 53. Q. De you think there is great scope for the construction of tanks in Sholapar. At present thure are only four irrigation tanks ?—Yes, there is some scope for tanks, if small ones are undertaken.
- 59. Q. Is the system of application in force is your district?-Yes, ou all works.
- 60. Q. Considering the limited area irrigated by these works, is it not possible to dispense with applications:

  —In regard to some irrigation, it is possible, but a man might change als crop next year.
- 61. Q. Assuming that to be the case, the mere presentation of application does not dispense with measurements. You have to keep your records ?—I do not toink the system would work. In a famine year or a year of searcity you would have 10,000 acres under rabi and the next year only 300. There are variations in the irrigated areas every year. The rayat generally changes for the sake of rotation, year. The rayne g
- 62. Q. Bot your measurements would be your record? The measurements are made after the crop comes to maturity.
- 63. Q. Is there any hardship catalled upon the people in the motter of water applications?—In years of scarolty, we give the water in auticipation of sanction. We generally give water as soon as the application comes in, but not when there is a rush on the water.
- 64. Q. (Mr. Ribetson.) You say in paragraph 24 of year note that the scale of charges is fixed for three years?—Yes, they are changed every three or five years. They are now fixed for five years. They may be altered at the discretion of the district officers.
- 65. Q. These frequent changes retard irrigation naturally to some extent!—I would make the period ten years; but I nm not very strongly of opinion that it will increase irrigation, which is not retarded on this account.
- 66. Q. (Mr. Muir Mackenzie.) Did I anderstand you correctly to say that, in ordinary years, your tanks are managed on putely commercial principles, and that you do not hold up any water on account of the pessible demand for rabi crops?—Yes.
- 67. Q. Are you aware that there is a difference in these principles on the Nira Canal? -I have heard so.
- 68. Q. When the Collector asked for the supply of water to Pandharpur, did you object?—No, it was given on sautory ground, with the express sacction of Government.
- · 60. Q. Have you made any observations with regard to wells, and can you tell us what the average cost of a kachoha, well is ?—I have not made any observations, but I know that the average cost of a kachoha well, with five feet huilt up that the average cost of a kachoha well, with five feet huilt up for one mot, is about Its. 300, and that it will irrigate

#### TWENTY-SIXTH DAY.

### Sholapur, 4th January 1902.

#### WITNESS No. 63 .- MR. A. F. MACONOCHIE, I.C.S., Collector of Sholapur.

#### Answers to printed questions.

- 1. The onswers below refer to the Shelapur District and the Akalkoi Stote nttached to lt. I have been Collector and Political Agent hero since Fobruary 1890.
- 2. The average rainfall in each month for the last len years has been as follows:-

				Inches.	Cents.
•	•		•	0	•9
	•		•	0	42
٠.				0	47.4
		•	• 1	0	41.6
		•		1	9
				8	77
				3	28
			•	3	45.4
				8	54.6
				8	46.8
	• `			0	88'5
		_	_	n	3
	•				0 0 0 0

Three, not of these ten, have been years of famine. We have not had good rain except in 1898 since 1805. In consequence there has been a most serious shrinkage of the consequence there has been a most serious shrinkage of the sub-soil water. Every hot weather there is a scaroity of drinking water, to say nothing of that required for garden crops. The formation of the country being trap rock is unforcentable for wells. It is therefore of the unnext hupertunce to impound by every possible means the seanty minfall we do receive, and not let it run to waste, as nt present, down milit and rivers.

- 3. The area of the Sheldpur District is 2,006,378 acres, of which the cultivalence is 2,478,979 acres. The proportion of the latter, which is protected by Government Irrigation Works, is 3 per cent, while that protected by wells is 32 per cent. In 1896-97, 99,388 nerse were irrigated by wells. In 1000-01, on account of the scanty rain year after year, and wells, in consequence, running dry, and 38 549 nerse were so living and only 78,849 nores were so lirigated.
- 4. There are no private or villago irrigation works. The soil is red-brown (disintegrated muram) on the up-lands, poor in quality, but good enough to grow the indinary food-grains. On the ploins It is brown, of fair quality; lathelow-lying lands and valloys it io black, of excellent quality. Both brown and black soil are irrigated. In a normal year the cultivation of food-grains, the slaple of the district, is independent of irrigation, practically. But of leto normal years have been rare. Ordinarily irrigation is resorted to for crops offer than the slaple food-grains, such as sugarcane, turmeric and plantains, which require water all the conditions, conious, tobecco, which require water from June to January.

  5. The obstacles to the extension of irrigation are the 4. There are no private or village irrigation works. The
- 5. The obstacles to the extension of irrigation are the capricions rainfall, so often insufficient to replenish tanks and wells, the incofficient supply of mnunre, which the neople employ so largely for fuel on account of the scarcity of wood, and the rocky formation of the country, on account of which much of the cultivable aren is up-lands, insusceptible of command from reservoirs, while every-where wells are more costly and loss enecessful than in alluvial tracts.
- 6. Lonus under the Land Improvement Act are readily taken by the people, both for the digging of wells and the construction of dams round fields to arrest the surface flow of rain. We get more applientions than we can comply with. I think the inlorest might be reduced, or altogether remitted, in consideration of the fact that n well or dam touds to seem the payment of lend revenue in the future; when a well has been could and no water has been found, I would remit the whole olvance.
- 7. There is no movement of cultivators from anirrigated to irrigated tracts, because the land everywhere has nearly

nll been taken up already, and there is no room for new-comers. The people are everywhere desirous of the extension of irrigation, seeing the bearits derived by the few lucky villeges that are commanded by the existing works.

8. Irrigation increases the value of the produce of land by enabling the owner to raise two crops instead of one, and so make the land productive all the year round, also to raise more valoable orops, instead of the ordinary foodgraine, to which he has to confine himself if he depends solely on the rainfoll. I have seen no cril result from irrigation, nor heard of any, except that after about twenty years continuous irrigation the land gets "tired." The romedy is to let it remoin follow for a year or two, and then manner it carefully before irrigating it again.

9. The Executive Engineer has submitted the necessary details regarding the tanks and ennals in this district, which are in his cherge. I am not able to supply any further information.

10. The average depth of permanent wells is about 40 fect. Some are as shallow as 80 feet and some as deep as 80 feet. The supply of water is mostly derived from percolation, and is liable to full in a year of drought, either colation, and is liable to fail in a year of drought, either wholly or in great part. It does not become online, except by surface centamination. The cost of a thoroughly built well in which two " mots" can be worked, with a colid masoury top, is about Rs. 2,500; while that of a roughly built one is about Rs. 500. The former lasts 100 years, the latter 20. The water is raised by n" mot " ar lonthor bag diagged up with a rope over a pulley by two, four, or six oxen, according to the depth, yoked together, and walking down a slape from the top of the well. The average area communited by a well is about 2½ agress if the crop requires watering throughout the conson, and about 10 requires watering throughout the occasional about 10 acres if the crop only nants watering occasionally. In a year of scauty reinfull a well will increase the value of the produce by about 50 per cent, but in n your of drought by much loss, because the water is pretty sure to give out. In a year of ample rainfall it is not needed and is not used, for a jet of ample rational risk not noceed and to not used, for the rain is sufficient. I am speaking of the ordinary foodgrain crops. But of course a well embles a men to grow another crop during the hot season of a superior kind in every year except a year of drought. The owner charges his tenant double reut for irrigated lend. Government, however, does not raise the assessment on this account. The double reut is clarged as the total season commends by the double rent is charged on the total area commanded by the

11. In this rocky formation it is a toss-up whether water is found at a particular out, or not, and the sinking of a chaft often turns out to be labour wasted. The main of a climit often turns out to be labour wasted. The main difficulty of sinking one is the hardness of the rock. The people, however, understand blasting very well. Boring down with irou crow-bars for a distance of 20 feet or so at the bottom of blosted-out shafts where no water has been found is sometimes attended with success, and I have taken great laterest in trying to encourage the adoption of this practice throughout the district not only in such cares, but also in cases of walls which assults hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly hold water and have roughly have rough niso in cases of wells which usually hold water and have run dry on necount of seanly rainfoll. What set me on this track was a well I saw at Aladha in December 1910, where the shaft found. The owner then got a long iron bar, slung it over a pulloy, set three men to hand it up and down, and one men to guido the blaws so delivered. In this manner he bored down gnido the blows so delivered. In this manner he bored down 22 feet, and who reworded by a flow of water hubbling up, sufficient to keep two "note" working all day during the season, and irrigating 6 acres of land. I immediately hought a lot of long but and distributed them among the Mainlatdars with instructions to lend them out to people who wished to try the experiment. I did the same thing in Akalkot, where the plan proved very successful. It was less so in the district, principally I consider from the want of zeal of the subordinate officials, who did not push the schome as they should have done. I had proviously bought a bering apparatus, but it gave no better results than the common iron bars; It had longer rads, but the reds had to be used as "jumpere" just like the bars, for of course in

Mr. A. F. Maconochic.

Macenochie.

Jan. 02.

Jan. 02.

Auotter letter, which I wrote to the Times of India ia Decomber 1900, about the well at Mádha, attracted the notice of Mr. F. J. Norman, an Engineer, resident in Japan, who wrote to me ahout the Japanese system of well hering which is called "Kaznsa," and which ha seems to consider very cultable to India, being cheap, rapid, and escried ont with very cimple apparatus. I have since been in communication with him, and I have reported the matter to Government for consideration whether it might not he advisable to get Mr. Norman to come over with a semal advisable to get Mr. Norman to come over with a small party of expert Japanese woll-einkers to try experimente in different parts of the country and teach their system to the natives. I append a copy of my report. The Rev. Eria Lewis, a missionary, stationed at Botul in the Central Provinces, also saw my letter in the Times of India, and he wrote to me from England that he had been much interested in the same subject, and had tried beging with Provinces, also saw my letter in the Times of India, and he wrote to me from England that he had been much interested in the same subject, and had tried horing with hare, as I had. His experience had shown him what we found here, that in the hardest trap rock one often strikes at various depths hands of soft decomposed rock which hold water, and that it is always therefore worth trial to go down a good deal deeper than the average native thinks of doing, who toe aften ahandons the attempt in despair when after going down 30 or 40 feet through hard rock he still finds no water. I think that an explosion of dynamite in a deep here-hele at the hottom of a shaft might often prove effective. If there is any water about, that eoght to fetch it ont. With the aid of the Executive Engineer I am geing to try soms experiments of this kind during the ensning season. Whatevor the means employed, I am in favour of well sinking being pushed on hy every possible means. I should like to see a special well-sinking brauch of the Public Works Department with parties in every district doing this aud nothing else. If we had had such an establishment since the beginning of our rule in these parts, there might have beeu by now a well in almost every field. And as wells are mado uselees by the subsidence of the sub-soil water that has taken place in this district owing to lung years of scanty rainfall, coincidently with well-sinking there should be a damming of the rivers and abids to impound all the rain water that now ruus to waste, ond so cause it to eink into the ground and replenish the epringe and hring the level of the sub-soil water up to ite former height or above it. Government should be money well spent in guarding against future famines. A special water rate could always he subsequently imposed to prevent excessive love. As far se possible, the owner of the fields should he employed in the work, for they would be money well spent in guarding against future famines. A special water rate could always he subsequently imposed t

12. No temporary wells are made in this rocky tract except in the heds of rivers and noise for the provision of drinking water during the hot whether. Government provide grants for this purpose in years of scanty rainfall.

13. I think that really scientific and decisive experiments in deep horing should be undertaken in the Decean, to find out whether there is any water-hearing stratum below the trap rock that could be utilized either by the mero according force of its contents on haing tapped, or by the employment of eterm-norms. ment of eteam-pomps.

14. Apropos of cleam-pumps, I think that there may be a great opening for their employment ou the hanks of rivers, and I would give special facilities and exemptions to enterprising land-owners who would set them up for irrigation of adjacent lands.

15. And I think that there is a large sphere of nsefulnot an American one with n straight plonging stroke, which I do not think is sound, but an English one with n sentral revolving spindle, and the result is highly satisfactory. It works with the mercat puff of a breeze, and in a tree like the December 200 and 100 eentral revolving spindle, and the result is highly satisfactory. It works with the merest puff of a breeze, and in a tract like the Decoan where cerery year the wind blows se steadily and strongly jest when irrigation is most needed, a machine like this is obviously of the greatest use. I have also put a Pulsomoter steam-pump in another well at Akalkot, to supplement the windmill pump on windless days. It does the work of two "mois" at slightly less coat, and I think that this expedient is also well worth the attention of capitalist agriculturists. It has excited u great deal of local interest and study at Akalkot, and many

leading men from the villages come in to look at both machines and consider whother both or either, perhaps on a reduced coale, could not he applied to their and their reduced ecole, contraining

reduced coels, could not he applied to their and their neighbeurs' holdings.

16. In the two last years of famine our efforte have, as far as possible, been concentrated on large irrigation tanks, of which we kept seven under construction. None of them, I am corry to say, have we been able to complete within the time during which the general distress lasted, a failors due to the magnitude of each tack. Every one of them ought to be carried to completion, famine or no famine, for they will, when finished, afford protection to their vicinity against the frequent failore of the raine in this tract of country. The Pathri tank, in particular, should be finished at once, for on its completion depende, not only the irrigation of a considerable expanse of country, but the water-amply of Effect towo, with its factories and railway that every year at present suffers from a water-famine overy hot weather, and has to fetch its copply from a noisa a mile and a half distant, in which the Monicipality, the Railway Company, and private gentlemen are reduced to dig holes to pravide themselves with one of the primary necessities of life. Before the necessity of water-works of every kind in this part of the connentry all other sorts of works are insignificant. Where a village was folly protected by already completed irrigation works, there I found not a single seal going, or ucediog to go, on to relief works. single seul going, or ucediog to go, on to relief works

No. D dated Sholapar, 23rd August 1901.

From-A. F. MACONCOMIE, Esq., Collector, Sholapur, To-H. F. BEALE, Esq., Superiotending Engineer on Special Doty.

Special Doty.

I have the honour to forward a statement showing the resolts of boring through rock for water in this district and the Akalkot state. You will see that while in many cases it was successful, in meny other cases it was not. I never thought it would be uniformly successful. All I cootend is that in this part of the ceontry there is no need for a myst to less heart se he does at present when after going dewn 30 or 40 feet through tock he fiede no water. There is always a fair chance that by going down 20 or 30 feet mere he may strike a fault in the rock or a stratum of red carth ("geru") or decomposed laterite which will yield water sufficient for one or two seasons' intigotice and availing to pull him through the bal times of drought.

Statement showing the names of the villages in which water-supply was improved by the boring of wells with iron-bars provided by Government.

Serial Nom- ber.	Name of village.	Origioal depth of the welt.	llepth of the hole bored	Whother water was imped or not.

In Madha Taluka no experiments were made with the

In the Patils' well at Madlis, the water rose 6 feet and lasted for four months when he used hie own bars for the first time irrigating 6 acres. When the water began to diminish, the l'atil agniu bored the helss deeper and the water rose 8 feet. The present height to which the water rises is only one funt.

In Malsiras the experiments were not saccessful.

In Bársi ditto

In Karmala in one case the water was found and in two other cases it was not.

In Pandbarpur, in one case only the experiment was attended with eny saccess, and in others it was a failure.

No. D dated Sholapur, 18th October 1901.

From-A. F. MACONOCHIE, Esq., Collector, Shelnpur, To-The Hou'ble SIR A. WINGATE, K.C.LE., Commissioner, C. D.

Last December I was much interested by a successful experiment at Mádha of boring deep through solid rock for water. The owaer of the well blasted down 56 feet without finding water. Then he got a long iron bar and drilled down 22 feet more, with the result that he obtained a bubbling flow of water that was sufficient to irrigate six aeres throughout the whole seasen. I brought this to the notice of Government in one of my Famine Progress Hoparts, and also wrote a lotter to the Times of India about it. I also set similar borings in progress in every taluka of the district with the result that in about 50 per cent. of cases water was obtained in previously dry wells. I have already communicated these results to Mr. Beale, and he has the matter under consideration. I believe that my crample was followed in Ahmedaagar with good success. My letter to the Times of India attracted the notice of Mr. F. J. Norman, an Engineer in Japan. He wrote to no in May on the subject, and I have since been in com-

manication with him It appears that in Japan they have Mr. A. F. n prouliar system of boring called "Kazusa" which enables Maconomics one with simple appliances to drive bore-holes down to great depths in search of water, and that the results 4 Jan. 02. obtained are execlient. Mr. Norman has seat me a cample of the bambon piping used, and also samples of the strata not with at depths of 300 and 720 feet at his own residence Kaikikan. I annex them. Unfortunately the samples of soil got mixed up in the opening, but they are of much the same nature. The fragmente of shells indicate a marino deposit.

- 2. You will see from the enclosed papers that Mr. Norman is anxious to be employed by Government to teach the people of India the "Kazasa" system of boring. He undertakes to bring with him three first clase Japanese well-horars. He states the terms on which he would be will to do the and asks for an eight months' contract. willing to do this, and asks for an eight months' contract, saying that a telegraphic remittance of 2,500 yes would be followed by the cunbarkation of himself and his party within a wesk from its receipt.
- S. I think the experiment is well worth trying. I do not know whether the Japanese methods would be of much avail in the trap rock of the Decean, but I imagine that iu an alluvial tract like Gajarát they might very probably prove of the ntmest value. The ingenuity and efficiency of Japanese workmen with the shaplest appliances are actorions. There is much force in what Mr. Aormau saye in his last letter to me: "The Japanese are a wenderful people, and have many ways of deing things that are for an nucleosted and semi-barbarone people infinitely superior to the ways we accidentally would force upon them. an nuequented and semi-barbarene people infinitely superier to the ways we accidentally would force upon them, irrespective of the fact that they have not been educated up to our ways and methods. I do really think their half-way methods, such as the 'Kazusa' system, are more applicable than our own advanced and scientific methods, that is where people like the Indian rayats are concerned. We work above their levels. Japanese officialdom works down to their levels. There is a mean, but the difficulty is to find it."
- 4. Commending this subject to the favourable notice of Government.
- 1. Q. (The President.) How long bare you been bere ?- Nearly three years.
  - 2. Q. All through the famine?-Yes.
- 3. Q. You say in your note, "In this rocky formation it is a tuss-up whether water is found at a particular spat or not, and the sinking of a shaft often turns out to be about wasled." You mean on account of the hardness of lock and the uncertainty of finding water ?—Yes.
  - 4. Q. You don't find salt in the wells !- No.
- 5. Q. You attach great importance to the extension of well irrigation?—Yes, combined with measures for raising and maintaining the level of the cub-soil water, such as damming natus and also patting anicuts across the rivote and running off the water into storage tanks at the side.
- 6. Q. Your view being that the first object in damming the rivers is to check the too rapid flow of the surface water and allow of its sinking into the sub-soil?—Yes.
- 7. Q. That is quite apart from direct irrigation !- Yes. for the sake of the wells.
- 8. Q. You say in paragraph 10, "The cost of a thoroughly built well in which two mote can be worked with a solld masonry top is about Rs. 2,600." That is a high price ?—That is an outside price for a very good wall.
  - 9. Q. Are many such built !- Not very many.
- 10. Q. I suppose they are built by takavi advances?—Yes, a great many, and a great number from the people's own resources—I find in the last 10 years that 1,910 wells were built with the help of takavi and 2,876 at the rayats' own cost.
- 11. Q. (Mr. Ibbelson.) Does that include kachcha wells?—Yes, a kachcha well means sank through rocks, without a mortar and stons wall at the top. In the kachcha well the wall is made of dry masonry, and is a very solid thing indeed.
- 12. Q. (The President.) The kacheha well has a leng 'ife ?—Yes, it has a lenger life than in Gujarat.
- 13. Q. Are there any kacheha wells without any masonry at all?—I think not.
- 14. Q. The really expensive part of the well is done when the trap has been pisceed?—Yes.

- 15. Q. Up to what amount do you give fakavi advances if a man was going to build a well costing say Rs. 2,000. What would be get from Government?—It depends upon how much land he has got and what accurity he has to offer. In one case we advanced Rs. 10,000 in the case of an enermous well 160 feet long and 30 feet deep.
- 10. Q. How much did the man spend?—I think he spent Rs 30,000; he lassix to eight metes going night and day, and hopes to be repaid.
- 17. Q. How much inigation is there under the well?—I den't know the exact area; it is comething very coasiderable.
- 18. Q. That is quite exceptional; supposing a man is going to build a well costing lis. 2,5: 0, what would be the amount to be reasonably expected from Government P-If we had as ample allotment, I would give him the whole
- 19. Q. Wenld that be pretty often done?—My experience has been that one-half or two-thirds is generally given. I think it would depend on the allotment at our disposal; if there were many applications, we should not give more than balf.
- 20. Q. Do you spend your allotment every your ?-Yes, of late it has been increased; last year we disbursed 3 lokhs, the year before 31 lakhs.
- 21. Q. (Mr. Ibbetsen.) Was that largely for seed and bullocks?—Yes, but mere than half for wells.
- 22. Q. (The President.) Have you ever applied for an increased alletment?—Yes, and my demands have been nlways met.
- 28. Q. You have not been restrained by want of money from granting takavi?—No.
- 24. Q. You say in paragraph 6, "We got more applica-tions than we can comply with. I think the interest might be reduced or allegather remitted." Do you think if the interest was reduced, it would make much difference?—I think pethaps it would be a greater inducement if the period of repayment were extended and the instalment reduced.
- 25. Q. What is generally the period of repayment?-Up to 10 years.

- Mr. A. F. 26. Q. I understand the legal time is up to 20 years;

  Maconochie. why is it generally shortened? is it nervousness on the part of the Mamlatdar that something may go wrong and that 4 Jan. 02. he may not get the money back as soon as possible.
  - 27. Q. You think the time might be extended of least to 20 years?—Yes.
  - 28. Q. How much do you think it might be extended to P—I mean extended up to the full 20 years. I don't think it would be wise to extend it mere than 20 years—unless the cosn himself proposed to return it sooner, I think the full concession might be granted.
  - 29 Q. The law is, I understand, that if a man at his awar cost constructs a well, he sholl not be charged extra accessment f—Ho is not charged onything extra doring the currency of the existing term of settlement.
  - 30. Q. Ho is not charged in all future actioments I am given to understand ?—I confess I thought that he would not be charged extra during the continuance of the existing actilement, but that some enboocement would be put on at the next.
  - 31. Q. That seems the general impression, although apparently the law is more liberal. It has been suggested npareous the law is more ineral. It has been suggested that, instead of asking a man to report the fakari advance at all, he might be made to pay un addition to his accessment—a wet rate insleed of dry; do you think that would be a popular method of proceeding?—Yes, I think it would be popular—it would be a very good thing to try.
  - 32. Q. In paragraph II you give an interesting account of what has been done to deepen wells; it has been attended with a good deal of soccess?—Yes, there were also many failures, but still we got success in so many cases that it seems worth trying.
  - 38 Q. Do you know what is the cost of boring per foot through trap rock ?—Very little indeed—it would be the wages of three men at three annas per day.
  - 34. Q How far would they get in the course of the day P-About a foot.
    - 35. Q. That would be nine annas a foot f-Yes.
  - 36. Q. You have had correspondence with Mr. Norman in Japan and reported the toatter to Gorornment suggesting that it might be advisable to get Mr. Namun to come over. What was the reply !— I have not get a reply.
  - 37. Q. Did you write lately "-Yes, the letter was sent to the Superintending Engineer for report by the Commis-sioner. I don't think it has reached Government.
  - 38. Q. You say that with the aid of the Executive Engineer you are going to try some experiments with dynamito in scarching for water. Hove you had time to make any experiments?—Only one.
  - 39. Q. Do the villagers readily pot hold of dynamite?-No. we had great difficulty in gottlag it op; we got it from the Agents of Messrs. Nobel & Co. in Bombay, but it was no the wrong time of the year; the railway company would not carry it then except on special terms, and we had to toke a whole waggen for a small quantity of ICO pounds; it is dengerous stuff; if the raynts handled it, they woold, I'm sure, blow themselves to pieces; they only understand blasting with natiro pawder.
    - 40. Q. They got that easily ?-Yes.
  - 41. Q. Yoo think there might he n special bronch of the Publio Works Department guing about to cover the country with wells ?—Yes, I should like to see some decisive boring, through this trop rock, going down 100% feet if necessary, to see if we can get iota another formation that hears water, nobody here can offord to conduct such experiments.
  - 42. Q. I suppose the Geological Department connet enlighten us on the point?—I don't think so.
  - 43. Q. In paragraph 14 you suggest the employment of steam pumps; ore there my in this district?—There is only one in Akalkot, it is a pulsometer, we use that on windless doys, when the wind-mill pomp will not work. I know of another man who had a steam-pump in the Boroda Stote, where it was very successful.
  - 44 Q. Hove you heard of any tendency among the agriculturists to start anything of that sort?—There are a few who are thinking of 11, but I don't think he idea has struck them generally ret-
  - 45. Q. It would be a great saving in cattle?—Yes, a great saving, but a difficulty would be fuel.
  - 46. Q. You ollude in paragraph 16 to windmill pumps; you say there is one at Akalkot; have you got any statisticas to what amount of water it roises or what is the oworut

- of irrigation done by it?—It is not for irrigation, but for the supply of water to the town. One big well of 40 to 50 feet ran dry, end this pamp put in water at the rute of a foot an hour; the cost of the wiedmill is it9,000.
- 47. Q. Yon have not seen it tried for irrigation?—No. Ooe day with a strong breeze it pumped water 104 feet high.
- 43. Q. How deep is the well, approximately?—Thirty or 35 feet deep, I think, with 4½ feet of water in it.
- 49. Q. You say in the last paragraph, "In the two last years of famine our efforts have, as far as possible, been concentrated on large irrigation tonks, of which we kept seven under construction. None of them, I am sorry to say, have been oble to complete." You think they should be carried on ?—Yes.
- 50. Q. Do you menn without waiting for the next famine?—Yes, as ordinary poblic works; the Pathri tonk should be the first, because it is most nearly nished.
- 51. Q. You ottach importance to it because of its belp-g the town of Lorsif-Partly and also on necount of
- 52. Q. Mr. Beale says it would submerge 818 ocres and irrigate 1,231, so that it would not be very useful?—We have taken up all the land that is to be submerged and paid componention, so that I think the work should be slorled.
- 63 Q. Have yoo always done that P-Wo have not taken up the whole of the over in all cases, but in the case of Pathri and Vadshivne we have taken up all the land that is to be submerged, for the rest we have only taken the land required for the work.
- 51. Q. As regards sites of possible reservairs, I suppose those you know are among those noted on by Mr. Reale?—Yes, the most important ones are those in the south-west, because that is the most distressed area.
- 55. Q. (Mr. Higham.) You say of the end of your memorandum "Where a village was fully protected by olready completed irrigation works, there I found not a single soul going or needing to go on to relief works." What do you regard no being fully protected P—A canal running right through the middle of the village.
- 56. Q. What proportion of the cultivated area of the villing should be fully protected in order to keep people off relief works? —I think 50 per cent.
- 57. Q. You think you must have 50 per cent.; less than that would not do ! I am not sure.
  - 58. Q. Have you not thought of it?-No.
- 59 Q. Take the villages that are protected by the Ekruk tank, for instance; do ony of the villages from there go on to relief works?—Very few, I am suce. I cannot tell for certain. I was thinking particularly of Woki village on the Mhasvad canal to which I went and enquired how many of the inhabitants had gone to relief works, and was told not as held reason. one had gone.
- 60. Q. The Mhasead tank irrigates on on average 6,500 nores and in the famine your, IS99-100', it irrigated IS90-0 nores, so that it did very well that yeu; taking the whole of these vidages in this tract, would it be possible to ascertain roughly what proportion of the population had gone to relief works?—I think we could find it out.
  - 01. Q. We should require-
    - (1) Cultivaled area.
    - (2) Aren irrigated.
    - (3) Population.
    - (4) Numbers on relief, including gratuitous and allfarms of relief.
    - (5) Area matered.
- 62. Q. There is no record in the village of how many people and gone to relief works?-No.
- C3. Q. I suppose the village patel could give a fair iden?.
- 64. Q. Here in Bombay did the people go le the nearest work or did you druft them to a distant work ?—We didn't keep them off the nearest work in 1809.
- 65. Q. Were you in charge of the district in 1896-97 ; 5 No, I was at home.
- 66. Q. I rumember when we came round here in 1899, we found that the labourers from many villeges in Sholapur were sent to the Shetphal tank 9—Yes, tifat was enforcing the distance test; this time we had be distance test.

- 67. Q. Have the mustor rolls been destroyed by now ?— I om nat quits sure about that.
- 68. Q. In that cose you must rely on the Patel; still there must be some sort of information available for the Eknuk tank?—Yes, I think so. I shall get it aut.
- 69. Q. I understand you to suy that samething should be dano by constructing noirs across the heds af the different rivers hote for holding ap water?—Yes, I should hope to see that done.
- 70. Q. Have you any idea of the places where that could he done?—It is merely a general impression of mine.
- 71. Q. Would you propose that Government should build a weir and let the people take all the benefit they could out of it?—I think it might be possible to run water into storage tanks.
- 72. Q. I'm afraid lie country does not lend itself to that; da you think it would be worth while to collect the water for purposes of lift?—Yos.
- 73. Q. In that case I suppose the people would not be able to pay enything for it, or would you put a water rate and—Yes, I would gut on a water rate.
- 74 Q. You could not increase the a-sessment for lands that are irrigated by a work of that kind?—I don't see why the assessment should not be increased if the land is improved.
- 75. Q. It could not be increased till the next settlement?—Yes, it could, by putting ou a water rate.
- 76. Q. The whole area would have to be measured up; the difference between imposing a water rate and increasing the assessment is that in the latter ease people are left more to themselves in the central and distribution of water ?—I don't see why the area irrigated could not be measured up; the village staff could do that.
- 77. Q. You say in puragraph 10, "The cost of u thoroughly built well in which two mots can be worked, with a solid mason; top, is about Rs. 2,500, while that of a roughly built one is about Rs. 500. The former lasts 100 years, the latter 20." Under these circumstances, would it not suffice to build the observer one? All that would fall down in 20 years would be the dry mason; at the top?—There is always an upper stratum of earth and morrow that would fall in; Rs. 2,500 is an anteide limit for a masonry well.
- 78. Q. Are not kachcha wells good onnigh?-Yes, for all proceical purposes.
- 7D. Q. You say the average area commanded is 2½ acres; do you mean only 2½ acres of crops are raised on each well in the year, or may not two or three erops be raised on the same land !—Yes, several crops.
- 80. Q. Da you mean the area actually commended or the area that is eropped every year?—The area to which water can be supplied.
  - 81. Q. That might mean more than one erop?-Yes.
- 82. Q. I think they have governly more than one erop an the well?—Yes.
- 88. Q. Is the aren that you have given for a woll of two mote or the aren for each mot ?--Far one mat.
- \*4. Q. Your blg well costing Rs. 2,500 would contain two mots β—Four mats.
- 85. Q. You say you think it would be n good thing if Govornment would make wells and charge a wet assessment on them ?—Yes.
- 86. Q. In that case do you think wells should be made by Government officers of the Public Warks Department or others, or wauld you give the money to the people and tell them to make them themsolves?—The people could do it cheaper and would profer it.
- 87. Q. You would give takevi advances and moke n perpetual charge !- Yes, instead of requiring than to repay the loan.
- 88. Q. It would proclically be equivalent to that; you would advance the money and require them to pay so much a year for extra land revenue. Do you think that would be worth trying?—Yes, I think so.
- 89. Q. Would there be any objections to it ?-I don't see any.
- 90. Q. If n well failed, Government would have to robuild it?—There would have to be some understanding about require. I think the man would be sure to keep it in repair himself.
- 01. Q. You spoke of the Pathri tank as one that should he completed at occe, because the Barsi town and Municipality are interested in it?—Yes, and the railway.

- t2. Q. Did they make any contributions towards the co-t, Mr. A. F. or do they pay for the water?—They don't pay for the Maconochie water; they have not contributed anything towards the cast of the work; the Municipality have ogreed to take up a loon for bringing the water into the town; they could not expect to got the water for nothing.
- 93. Q. I suppose you could not charge them very much ?—Na, they are rather a poor Municipality.
- 94. Q. Have factories spplied for water f—I think they would agree to take it, the railway has promised to pay for the water supplied.
- 95. Q. The tunk could not supply much for irrigation if it has to supply all this?—That would seriously diminish the water for irrigation.
- 96. Q. You would always have to keep up a certain minimum supply for the town?—Yes, it would be like the Ekruk Tank.
- 97. Q. Nothing has been settled about what they would pay for it ?--No, no one knows if the tank is to be completed.
- OS. Q. World 'n incidence completion in arrangements could be made as to what they should pur?—If Government saw their way tawards gotting some return, they would earry the work to completion.
- 09. Q. In regard to taking up land for the small tanks that are proposed, is it necessary, do you think, to take up all the load that would be submerged; do you think the people themselves wish it taken up or would they prefer to be allowed to cultivate it?—They would prefer to retain it.
- 100. Q. If the people themselves are not very anxious, ought it to be considered whether we might not allow them to retain the awarrship ?—One never knows haw much land will be submerged.
- 101. Q. I think all the land that is submorged could be cultivated; if the people who own it were allowed to retain it, it would probably make the works more papular and it would reduce the cost of water. I understand in this tract you have actually parchased the land P—Not all.
- 102. Q. Have you knows cases in which the owners of land have objected to its being taken up; I suppose you natify it nader the Aot?—We have been settling it by private armagement; in ano case it is doubtful if the land will be submerged every year and we have allowed the owner to rote in it; it esays ho won't claim any dumages if the land is submerged; we paid no compensation to him. But the deeper land always is submerged. I don't think our tanks over run quite dry.
- 103. Q. There must be a large area round the edge that is dry in dry years and might be caltivated f-Yos.
- 104. Q. Where did this windmill come from ?—From England; it was ordered out by the State and cost ultogether Rs 9,000.
- 105. Q. Have you any idea of the quentity of water it rnises P-No; I have never had it measured.
- 106. Q. Haw high dees it lift water?—About 25 to 30 feet; it is then run through pipes into another well, whence it is lifted into the reservoir; it is for the water-supply of the town.
- 107. Q. Wherever yan have a wind-mill for water-works, you would require an oil engine or bullacks to work when the wind fails ?—It would be a nseful supplement, but the breeze is protty steady during March, April, and May.
  - 108. Q. It can be relied upon then ?-Yes.
- 100. Q. If lifting manhinery is put an to these Government streams, would Government want to charge any rayalty for the use of the water ?—Yes, I suppose they would.
- 110. Q. Are there Government arders to that offect ?— Yes, we charge for water raised from nalas naw (a patasthal charge).
- 111. Q Is that rate charged in this district ?—Yes, but rarely.
- 112. Q. How is the water raised,—by bullooks ?—Sometimes by ballooks, sometimes by hand lifts.
- 113. Q. What is the amount of the charge ?- Rs. 3 per nere.
- 114. Q. What is the total amount ?-Samething very small, only a few handreds of rupeos.
- 115. Q. (Mfr. Ibbatson.) You say that when a man builds what has been called a kachcha well, he builds up dry mascury from the surface of the rock to that top; how long would u well of that sort last on the average?—About 20 to 25 years.

Mr. A. F. 116. Maconochie. Rs. 500. 116. Q. What would be the cost of a two-met well?-

4 Jan. 02.

- 117. Q. As much as that ?—I think so; it depends on the size of the well; it would probably he within Rs 500.
  - 118. Q. Something like Rs. 500 P-Yes.
- 119. Q Then esting uside your Rs. 2,500 well, which is a luxnry, supposing thet instead of spending Rs. 500 on a well to last 25 years, a man wauted to make oos to last from 50 to 75 years, that is to eay, to build it with mortar and musonry, whet would the cost of that be?—It would cost from Rs 750 to Rs. 1,030.
- 120. Q. Ho woold get double the life of his well ut less than double the cost ?— Yes.
- 121. Q. The President made a suggestion that the most expensive pert of a well was finished when the blasting hed been done; you seemed to assent, but I am not quite sure if you did, have you considered the point ?- No.
- you did, have you considered the point?—No.

  122. Q. You say if you had many applications for tokevi, yoe would probably give u man only half the amount he saked for so as to spread the benefit over as lerge a nomber no possible; does that not meen often that he cannot make a well at all, or that he makes a vory foreion well which is in the end more costly; would it not be hetter to give the full amount a-ked for to half the number of people who had mede applicatione and let them meke thoroughly good wells. I am referring to ordinary yoers, not famine years?—I thick they are apt to ask for more then they reelly want.
- 123. Q. I don't mean to give as much as they ask for, but only enough to make a good sened well to last any 50 years ?—Yee, I thick it is.
- 124. Q. You say that the amount advanced to a men depouds on the value of the security be offers, that is the unimproved value of the lend?—Yes.
- 125 Q Your loss in to ke vi by irrecoverable advances is very small?—Yes, spart from the famine.
- 126. Q. Is that wholly due to the caution that is exercised by your Mamlatdar, or in part or mainly to the feeling amongst many people that the taken is a debt of hooour; does that feeling exist here?—I am afmid it doce not exist.
- 127. Q. You don't think it would be safe in making ad-127. Q. You don't touch it would be sare in mixing acconces to go beyond the value of the land as it chands, in consideration of the fact that, when a well is made, the value of the land will be doubled. Do you think you might be holder than you are nt present in the matter of advences?—I think in view of the oncertainty of striking a good snipply of water or perhaps gotting any water ut all, it would not be very prudeot.
- 128. Q. Supposing Government safeguarded itself, first by a trial boring so an to satisfy itself about the water; and secondly, in order to make our thet money was being spent on the well, by advancing the money in instalments; with these two precautions do you think it would be safe to lead beyond the value of the laud F—I think it would ho rather risky.
- 129. Q. The reason I ask is that we have heen told by several people that a serious obstacle to the extension of well inigation is the difficulty of getting enough money to make a well; Government is ready to advance something, but half the amount is uo hetter than nothing if the rest of the money cannot be got; therefore I am unxious to know what you think about more liberal advances P-(No
- 130. Q. You say you would not extend the period of repayment of advances over twenty yeers; but you are pre-pared to substitute wet assessment as a permunency; what is the advantage of the wet assessment over the instalment principle?—I think perhaps it would be more
- 131. Q. Why should it be more popular; why not extend your taker; period if necessary beyond 20 years?—Would it not menn more Government money outstanding; can Government afford to get it back so elowly?
- 132. Q It would mean even more than that; if you only take wet a seessment, it would practically be a permanent leau ?-Yes, earning good interest.
- 133. Q. I don't quite ere the objection to extending the period of twenty years if you are prepared to adopt the other cystem? (No suswer.)
- 134. Q. Supposing you imposed a wet assessment, I presume the best well must feil in course of time, and you could not go oo recovering the wet sessessment after the

- well had ceased to be workable, could you?-I soppose you woold have to mend it.
- 135. Q. Is that always possible; is it not sometimes cheaper to huild a new well, when a well gets to a certain age?—In the case of a well sunk through rock it would be cheaper to clean out the old shaft.
- 136. Q. You don't think there would be any limit practically to the age if the well is repaired F-No.
- 137. Q. Did you make eny nee of the notification in regard to increase of powers to subordinates for granting advances?—We only gave increased powers to Memlatdans, nod we employed certain head Karkuns.
  - 138. Q. How did that work, was it satisfactory ?-Yes.
- 139. Q. Would you be prepared to alter your roles and give increased powers to lower reveues officers than now have the power? No.
- 140. Q. At present only the Assistant and Doputy Collector have the power?—Yes, and the Mamlatder for small amounts.
- 141. Q. Would you advice giving the Mamlatdar iccreased power !-Yes, I thick so.
- 142. Q. Would you limit the amount to Rs. 100 ?-I thick they might be given power to Rs. 300.
- 143. Q. You say in your note that there have been four femines in Sholapur in the past 25 yeers. Whon did they occur?—In 1876-77, 1896-97, 1899-1900, and in the past
- 141. Q. Is the whole district subject to famine?the two eastern talukas, Barsi and Sholapur, less thau
- 145. Q. Were many kachcha wells made during the famine?—I think the majority were kachche, but I beve not got separate figures.
- 146. Q. By kackeka I understand you to mean dry massury?—Yes.
- 147. Q. It has been suggested that people should be assisted by grants-in-aid to make them pakka. Do you think that would be n good thing?—Yes, I think it would be—it would prolong the life of a well.
- 148. Q. How would you set about it?—By giving them additional takavi for morter and labour.
- 149. Q. Would they take it to make their wells pakka? We might give it ou very easy terms, perhaps charge no interest ?-I think they would be gled to take it.
- 150. Q. You thluk thet would be a good thlug to do?
- 151. Q. You eay that in a normal year the cultivetion of food-grains is independent of irrigetion. Does that include rabi crops?—Yes.
- 152. Q. You have no winter snius bere like they have in Northern India ?—No.
- 163. Q. Would you ordinarily in a fair year get fair rabi crops without any irrigation at ull ?—Yes.
- 154. Q. What interest does a bonia charge if a fairly well-off tenant horrows money to build a well. I meen an ordinary solvent tenant, not au extraordinarily well-off man P—Not less than 12 per cent.
- 155. Q. Wells are used ordinarily for garden crops, the highest form of cultivation, and sugarcane, are they not ?-
- 156. Q. With regard to these wells that you would like to make all over the district, do you contemplate their being used for that form of cultivation?—Yes.
- 157. Q. Do you think the supply of manure would be sufficient for them F- Yes, I think so, because the number of cattle would increase.
- 168. Q. I suppose it is only a man who is fairly well off who could go in for that kind of oultivation; it is expensive;/
  there is a good deal of lebour and manure required; do you think people would use their wells to the best advantage?—

  I think the people might be trusted to do that.
- 159. Q. You propose that Government should make them or pey for their being made P—Yes.
- 160. Q. How do you propose that Government should recoup itself P—By increesed assessment.
- 161. Q. With reference to this case that you quote in paragraph 11 of a well io Andba where a shaft was sonk 56 feet without water and eventually water was found by boriog 22 feet desper, did the water rise in the well?—Yes

4 Jan. 02.

162. Q. To what dopth?—There was 6 feet of water every morning in the woll, the owner drew that off hy svening and again next morning there wee 6 feet of water in the well.

163. Q. Did ho lift the water 78 feet (56+22) ?—No, he had to lift it 50 feet.

- 164. Q. You eaid just now there is very often no water to be got, we have been told that, supposing a well was made regardlese of cost in all ports of the Deccon, where they could be made, even then we could not irrigate more than one-tenth of the cultivated area; what do you think as regards your district, supposing you had a well wherever it could be worked profitably; is that a low or a high estimate?—It sounds to me a low estimate.
- 165. Q. Would you double it, at any rate it would be a small proportion, it would never be noything like one-half?—No, nothing like one-half.
- 166. Q. You say in paragraph 14 "a propos of steam-pumps I would give special facilities and exemptions to enterprising land owners who would set them up for irrigation of adjacent lands." What sort of encouragement has suggested itself to you?—I think I would exempt them from any charge for water for the first ton years.
- 107. Q. The Bombay Government has given them leave to irrigate a certain area free of charge; is it best to limit the area or limit the term and let them irrigate as much as possible ?-I think to limit the term.
- 16S. Q. You say in paragraph 16 I have also put a Pulsemetsr steam pump in another well at Akalkot to sapplement the wind-mill pamp on windless doys. It does the work of two mots at slightly lese cost. Do you include the deterioration of machinery and interest on capital cost in working that out?—No, I have not worked it out, that is only what the Administrator told me. I coold get it worked out if you like.
- 169. Q. Yes, please, I should like to know. In any case the fact has to be coosidered that the mea and bollocks for whose laboar the Administrator will charge in calculating the cost of well irrigation must be there to a large extent and lie idle if the pump does the work for them P--Yes, that is no. I suppose they could be complayed clambure. that is so. I suppose they could be employed elsewhere.
- 170. Q. Speaking of protected villages where no one went on relief, were there any well-irrigated villages ?- No, I was thinking of Waki.
- 171. Q. What is the history of wells in the samine ?-A great mony gave out.
- 172. Q. Wheo ?-In 1899-1900. We have not had good rainfall since 1898, either wells rau dry or the supply of water falled.
- 173. Q. Next year?—In 1900.01 they were worse still, the irrigated area saok from 99,000 to 78,000 in four years notwithstanding the kachcha wells made.
- 174. Q. Do you know whether before the fumine wells were lying disused !- I don't think many were disused.
- 175. Q. You were not hero?-No.

176. Q. (Mr. Rajaratna Mdlr.)—In paragraph 3 of your Mr. A. F. memo. you give the cultivable area. What is the occupied Maconochic. area?—It is nearly all occupied, there is very little waste, I have not got the figures.

4 Jan. 02.

177. Q. (The Precident.)—Have you any reason to believe that the population has gone down since 1896 in this district?—No, it has not increesed as rapidly as it otherwise would have done; the ceasus gives a decrease of 30,000, that is due to emigration, 50,000 to 60,000 people went to Berar, but many people have returned, in fact there has been a small increase I am sure.

178. Q. (Mr. Rajaratns Mdlr.)—Mr. Lawreuce shows a large area mider "other sources."—What is that ?—It is not a large area, only 2,000 acres from nalus.

179. Q. It has decreased from 6,000 to 2,000, what is the reases of the decrease?—Nalas ranning dry; there has been a scanty rainfall for so many years running.

190. Q. In the past ten years large sums have been advanced for wells; de you know the number of wells constructed or repoired P-1,910 were constructed and 2,778

181. Q. What steps are taken to see that the 7 to 8 lakhs that have been advanced for wells have been properly utilized, are the wells inspected ?—Yos, the Mamlatder inspects them.

182. Q. Are they required to sead in a report?—There is no regular system of inspection.

183. Q. I suppose you graat advancee in the lamp and not by fixed instalment ?—Yes.

184. Q. So that there is practically no check as to how moch has been reelly spent on the welle ?—Euquiries are made and if a case is found aut of money not heing properly spent the whole advance is recovered in a lump.

185. Q. There is no systematic inspection !- No, no returns are sent in.

186. Q. On the Ekruk tank we found that the highest aren irrigated was onder 5,000 aeres in 1899-1900 and the average aren about 3,200. Is there any possibility of extending irrigation ?—I thick the Poblic Works Department. had better be consolted on that point, the question of Ekruk is complicated by the water-sopply of the town, tho railway and the mills. I don't think there is much chance of increasing the irrigation from that tack

187. Q. Are there any wells to supplement the irrigation from the tack ?—I believe there are the usual number.

188. Q. Within the area commanded by the tauk ?—Yes, I believe like any other village they have the usual number of wolls.

189. Q. Is the eystem of application for water in force under this tank !- I think so, I have not studied the sabject:

100. Q. I ask the question because the Executive Eggineer is not coming for exomination?—I think he has referred to it in his writton reply.

WITNESS No. 64 .- ME. H. L. PAINTER, I.C.S., Assistant Collector, Sholapur.

Answers to printed questions.

I must prefine my remarks by saying that my experience of the Decean is confined to the last nine months, during only about three of which I was travelling in the district. All my previous experience is of Gujarat. Consequently the information which I have personally negotive is small as regards the Decean.

I now take the points in the memorandom on which I am capable of giving any information.

Point 2.—The gross area of the Sholnpur District is 2,909,378 heres, out of which 2,478,979 is returned as culturable. The praportion of the latter protected by Government irrigation works is '33 per cent. and hy wells 3.2 per cent. "Private or village warks" do not exist, as far as I know, in any shape other than wells or embankments; the former have been taken into account and no statistics are areallable for the latter. The soil region greatly, two bread arollable for the latter. The soil varies greatly: two broad divisions are the henry black soil of the valleys and the tight gray soil of the uplands. Relafoll averages 25 inches: the lote rains are chiefly depended upon, rabi crops being the backbone of cultivation. Water is only used doring the measure for garden crops: for ordinary crops it is ased, if

available, when a prolonged break in the rains occurs. All orops are capable of irrigation, bot with a good moneoun only such crops as are known as garden orops require it. Engarcane and makka (moize) are the chief bagayat crops of the district as far as I have noticed. The number of waterings depends on the soil, method of cultivation and waterings depends on the soil, method of cultivatioe and kind and quantity of manner used: I connot give any precise figure. Distribution of water from emals is controlled by the Irrigation officers and their subordinates, who by personal inspection see that no one gets water from the sauni unauthorizedly and that no waste occurs. A man pays so much per acro for any particular crop (there is a regular scale, in which sogaroese comes highest) and can take as much water for that crop as he whats. Irrigotion revenue is realized in cash at the time of the land revenue instalments. instalments.

Point 3.—There is practicelly no cotton grown in the district, and the black soil of the valleys above alloded to differs from the black cotton soil of Broach and Surat in its properties, though it somewhat resembles it in appearance. The black soil of Sholapur cao he, and is as a matter of

Painter. 4 Jan. 02.

Mr. H. L.

Mr. H. L. Painter. 4 Jan. 02.

course, irrigated with success, whereas irrigation of cotton soil in Gujarát is, os far as my experience goes, a failure. Point 4.—The completed tanks in my onbelvision (Sholapur, Bársi, Mádha oud Karmála Tálnkus) are the Ekrak and Ashti tanks. I cannot give toolmical figures. These works cannot be entirely depended on in a season of drought, but if the early rains are heavy they are expedience of rabic crops owing to an early coesation of the monsoon. Yorks atill nucompleted are the Pathri, Hotgi, Vedshivne and Manji tanks. Manji tanks.

Manji tanks.

Point 5.—The Public Works Department is concerned with this: I know nothing about it.

Point 6.—Distrist and village works are, as fares I know, naknown here. The only way I can think of in which each works might be assful would be if they took the form of impounding water in nales during the monocon so as to raise the level of the sub-soil water in the neighbourhood, thereby improving the supply of water in wells for drinking and irrigational purposes.

Point 7.—The total areas irrigated from wells (for the whole district) doring recent years have been as under:—

		3		
Ycor.				Aores.
1895-1896		•		85,196
1896-1897	•	•	•	99,383
1897-1898			•	94,321
1898-1899		•		91,858
1899-1900	•			91,981
1900-1901				78.849

I imagine the falling off this year has been due to the decreased supply of water in the wells following on a succession of droughts. The number of new wells constructed dering the last ten years has not yet been ascertained. Construction has been assisted to some extent by tagdi. I consider the advances as now made for this purpose are liberal eaongh. No inducements are required; it is the complexity of the system and the delay generally involved, as well as the fact that he hardly ever gets as much as be sake for, which put the rayat against tagdi in many cases. Wells in this District were seriously affected by the recent drought in nearly all the supply greatly diminished and in many it ran dry altegether. Bering with a "jumping-bar" aided with blesting powder proved wonderfully soccessful in mony cases, but failed in others. I cannot give numbers. Depth of water in wells varies immensely: in coils where there is no rock water is often found 15 feet below the sarface, in rocky parte soldem less than 30, sometimes not even at a depth of 100 feet, below which borings are burdly over made. An ordinary well for irrigation costs about Rs. 300. The area sorved varies with the cize of the well and the nature of the cultivation. Six acres at a time might be an all-round nyerage.

Point 8.—The mediating character of the District I imagine the falling off this year has been due to the

Point 8.—The undulating character of the District renders it absolutely free from water-logging.

Point 9.—Is Public Works Department matter as far as statistics go. All the incomplete works mentioned under point 4 anght to be completed as soon as possible, but Hotgi and Pathri are less urgent than the others named. The reason is the uncertain character of the rainfall in this Dietrict which is nototious. I have heard that some small (village) tanks in the Karmala Talnka, constructed as famine works in the femine of 1876-77, have become practically nesloss owing to want of maintenance. I have not yet seen them, but will have my ovidence on the point ready by the time the Commission comes to Shelapur.

Points 12, 13 and most of 14 nro not in my province. No whole villages are protected by the irrigation schemes in this District, so the necessity for relief in a famine year is not anywhere entirely obviated by them.

- Gonoral.

- 1. The Solaper, Barsi, Madha and Karmala Talekas of the Sholapur District. I have held charge only eince May last (aix months) and have travelled in those talukas very little, but I have visited them all off and on. Consequently I cannot profess to know thom at all intimately.
- 2, 25 inches is about the average fall for the year. I have not got the menthly figures.
  - 3. (1) No.
    - (2) No.
    - (3) Yee, I think manure would fall short.
- (4) Nearly all the culturable land is suited for irriga-

- (5) This difficatty has not occurred in the tanks now in use except in years of actual drought, s. c.-just when the weter is most wanted.
- (6) No. . (7) Not at all. (8) No.
- (9) The chisf reason which militates against extension of large irrigation works in this District is, 1 helisco (it is a technical matter), paccity of sites for tanks. Irrigation from wells is capable of almost indefinite extension.
- d. Land is exempt until the experience of the current revenue ectilement, which remains in force for 30 years. Exemption is secured in practice by leaving things as they are. I cannot say what the case may be with tenants and their landlords: it would dopend on the length of the lease: I consider the existing provisions sufficiently liberal: no one ever complans of the assessment or the water-retes.
- ever complans of the assessment or the water-retes.

  5. Not very freely: the only hindrance, I think, is the nufamiliarity of the rayat with the system and the bother he is put to to get an advance which, if he gets it, is often too late or too small to be of much reat use. Much can be done by systemalizing enquiries instead of souding potitions, received at any time, from pillar to post, as is often done. The Sub-Divisional Officer can rashy put things on a more husiness like basis. But many difficulties are insaparable, i. e., the land in which the well is required is often mortgaged, and this always complicates the procedure and often proves a her to the loan. Interest and instalments are liberal enough. Remission in cases where the attempt to obtain water fails should be (ond I believe is) allowed to the exteat of the money actually expended. No other concessions ore, in my opinion, required: no rayat considers our present terms envasionable.

  6. No; irrigation is too sparse here for that.
  - 6. No ; irrigation is too sparse here for that.
- [ Qoestions ? to 83 I cannot answer. I have hed no experience of irrigotion, canals or tanks previous to my arrivol tu Sbolapur, and very little since.]
- 34. (1) About 15 feet in soft strate and 30 in recky
- (2) Percolation os a rule or minute springs which cen-not be distinguished from it.

The level always gets low in the bot weather, and water is liable to fail altogother when there is real drought.

- I have not seen any cases here of water getting salt in the hot weather.
  - (3) Rs. 300.
- (4) For over, if kept in repair and free from inundation
  - (6) By water bogs (mot).
  - (6) Twenty nores.
  - (7) Six ocres.
- (7) Six ocres.

  35, (1) Given a sufficiently large holding and enough live stock and manure, a man can in an ordinary year double-crop parts of his land, but not the whole, if he has a well. But this takes a lot out of the soil and means constant labour. Ordinarily not more than a quarter of the area commanded would be irrigated in any one year, and a doable-crop once in four years would not do undue harm, given, as observed above, pleuty of meaure. In practice, however, not more than helf the land irrigated would be sown with dry crops in the same year. sown with dry crops in the same year.
- (2) In an ordinary year the irrigated crop is almost always of the more valuable kind, chiefly makka and angarcane.
- (3) I do not think n well is often used to increase the outturn in a good year. It is in years of scanty rainfall and of actual drought that a well is chiefly neeful, as it is and of actual drowth that a well is chiefly neoful, as it is then that it makes the difference between poor or no crops and good crops, to say nothing of its powers of producing fodder. But of course onything like n fall yield over the belding is impossible whoe well-water takes the place of rain; even were there a well in every field and water in plenty in every well, the lahour necessary to irrigote the whole would never be avoilable unless the existing stock of bullocks were moltiplied over and ever agoin. Thus wellscan he and are a great pallietive, but not a complete preventive, of famine due to failare of timely rain.
  - 86. (1) I cannot.
- (2) Total drought and perfect irrigation woold mean a proportion of ? 1, i.e., infinity.
- 37. Government nescessment is roughly Rs. 1.2.0 per acro for bagayat; 12 acras for jirayat. The rent of a field

is trippled or quadrupled by the existence of a well: per nere bagayat ront would work out to shout Rs. 5, jirayat to about Rs. 1-8-0 or Rs. 2.

38. Water is generally to bo found in the valleys where 38. Water is generally to be found in the valleys where there is black or other deep seil, and outlivation shounds. Unoultivated uplands, or outlivated parts where muram is near the surface and solid rock a few feet below, are usually hapeless for horing purposes. Inasmuch as most cultivation is in the lewer-lying lands answering to the first description, there is not, as a rule, difficulty in fluding water by boring or digging in the fields. But village sites are often, indeed generally, on comperatively, high rocky ground, and hence it is not infrequently hard to find water for demestic purposes near the place where it is most required.

- A good deal was done last year in the way of baring and blasting in wells of which the supply had run dry, generally with success. But this was in the case of existing wells. I am not awara of ony cases where trial horings were made or tools lent to individuals. I do not think trial horings would be of much use here, because, as I have said borings would be of much use here, because, as I have said water can generally be got in the lowland fields, and in the high ground wells are seldom required except for drinking Imposes, whon it is hest to bore the already existing wells.
- 39. I think that, with the consent of the occupant, Gererument might undertake the construction of wells in private holdings, charging nathing, but recouping themselves evolutely by the increased bagayat assessment. But diffi-
- 1. Q. (The President).—You begin your note by saying you hove only nine menths' experience of the Decean, nod that you were previously in Gujarat. What district of Gujarat were yeu in ?—I was one year in Ahmadabod and 3½ years in Broach, after that I was Personal Assistant to the Commissioner and he sent me all over the famine district. districts.
- 2. Q. You say in the first page af your memorandum "the block coll of Shelapur can he, and is, as a matter af course, irrigated with success, whereas irrigation of cetton soll in Guzeint is, as far as my experience goes, a folluro." Have you seen them irrigating the black soil freely here? -Yes.
- 3. Q. Has that been en account of the extreme drought da yau think in a normal year they would have irrigated it?—It is black seil which would toke water in ardinary years, it is not black cotton soil, that is very different.
- 4. Q. Supposing any large scheme for irrigation is hit npon for Shalapur, could one count in normal years upon the water being freely taken in bleck soil?—I thick so,
- 5. Q. It is quite different from the Branch seil !- Yes. quita.
- Guita.

  6. Q. Alluding to advences you say "I censider the advances us now made for this purpose are liberal enough. No inducements are required; it is the complexity of the system and the delay generally involved, as well as the fact that he hardly over gets as much as he asks for which put the rayat against tagai in many cases." It is an extremely importent thing that a man should take advantage of the system with a view to the extension of the well irrigotion af the country; do you suggest any means of furthering it P—If we could get things do no a little more premptly than they are new, it would help.

  7. O. How leng does it take a man te get an advance.
- 7. Q. How leng does it take a man te get an advance from the time he makes an application?—It depends upon the system which is established in the sub-division; if you go in for a system of written petitians which have to go fer repart to the village officers and theu come back, it may teke six menths, but if it is systematized, I think, I could guarentes to da it in a month.
- 8. Q. Is it the Mamlatdar whem one must rely upon for information about it P-Ne, it is the village afficers.
- 9. Q. Cen you see my way of simplifying matters. plifying so as to make thom premptor and easier P—I think paper writing should be as far as possible abeliahed. In the taluka for every payment mode no less than nine different documents have to be executed, that three time.
- 10. Q. Are these documents simply bearing upon the an's credit security, bona fides, atc. ?—Yes, and some are man's crodit security, bonh fides, atc. ?—Yes, at simply necount matters, taking signalures, etc.
- 11. Q. You think that kind of thing is over-dene?-Yes, very much so.

culties would undeuhtedly supervene, e.g., the uliquotian Mr. H. L. of parts of the land commanded by the well, when disof parts of the laud commanded by the well, when disputes os regards the rights of the porties over the well might follow. If, however, the well were made Government property in perpetuity, Government would always he in a position to direct who should have the use of it. I feer that at this best the complications which must cusue would go so far to annihilate the assistances of the scheme, but it might be tried, especially in vatan lands or lauds occupied on the new non-tronsferable tenurs. Current repairs to such wells would have to be effected by Government, and this would no doubt be a heavy charge; but if experience showed that these expenses oud the initial expenditure could not be recouped by the ordinary bagagas excess over the dry crop rates the former might legitimately be increased in such cases. creased in such cases.

creased in such cases.

40. Yes: temporary wells, or helas, as they are called me often dug in the heds of watercourses to provide water for drinking purposes and for watering cattle when other oupplies are searce. Water is also occasionelly lifted from them by mets for irrigation. The water is usually to be get of a depth of three or faur feet. Inasmuch as a fairly large watercoorse is a sine qua non, such an expedient can only be reserted to in very limited arcses, and a hela only lasts for one dry senson. I do not think much encourogsment is nechel: a 'nita costs pradically nothing.' Liut as it is, sums have been given in many villages from Government and Local Fund grants for the constraction of such temperary supplies. temperary supplies.

- 12. Q. Is that due to undue caution on the part of the establishment concorned or is it simply the insistences of red tape?—These nine documents are entirely red tope.
- 13. Q. You say that the rayat rarely gets as much as he asks for; what prevants him getting what he asks for?—Generally I think the impossibility of knowing exactly hew much the work will cest and a certain amount of suspleion as to the genniueness of the application.
- 14. Q. (Mr. Ibbelson).—What does "geunineness" mean?
  —A man will ask for ks. 50 to deepen n well, he may
  deepen it 2 or 3 feet, yen den't knaw if he m isoppropriates
  helf the sum received or not.
- 15. Q. (The President).—Is it possible to control that ?—I think so, by visiting the place and making the mnn point out exactly what he wants to do and then having on estimete made, but you want a certain emeunt of skilled assistance for that.
- 16. Q. This visiting and making enquires is that asking from the Local Government efficers more than they have time to do ?—No, not fer wells, but fer seed and cattle would be a different matter.
- 17. Q. If a man asks for Rs. 500 to make a well and you have reason to believe that that is the cost of the well, would you give bim the whole amount?—Yes, I would give it to him.
- 18. Q. Mr. Macenochie said just now that in order to make the money go as far as possible it might be desirable to give only half the amoent asked for f—1 den't think it has been necessary where I have been. We have always had as much as we wanted.
- 19. Q. Havo yau yourself seen much of this well deepening by blasting ?-Na, not much.
- 20. Q. You say on page 3 " all the incomplete works montioned under point 4 ought to he completed as soon as pressible, but Hatgi and Pathri are less urgent then the others named." Why do you say preference should he given to the others?—Because Sholapur and Barsi talukas are much less liable than thoothers to famine.
- 21. Q. You say "I have heard that same small village tenks in the Karmala toluka constructed as famine works in the famine of 1876-77 bove hecame practically useless owing te want of maintenence". Coming from Gusorat here I suppose you see a great difference in the number of village tanks?—Yes, in Guzorat every village has a truk, here it in quito the exception.
- 22. Q. Would yan sey that the neture of the country, the general amenut af slape, etc., is sufficient to account for that here, is it possible to make tanks here as easily as in Gujaret?—I think almost easier, I don't know why they have not got them; in Gujarat you have to dig your tank ant of the flat plain, here you only require to make a hund.
- 23. Q. (Mr. Ibbetson).—Da they grow much rico here?
  -No, very little indeed.

4 Jan. 02.

Mr. H. L. Painter,

4 Jnn. 02.

- 24. Q. (The President).—Have you seen these large tanks in the district; do the people seem to appreciate them?—Yes, there is only one in my sub-division—the Ekrak, the Ashti is on the horder, I don't know much about it, as the cauals are in the other charge.
- 25. Q. You say on page 3 " the chief reason which militates nguinet extension of large irrigation works in this District is, I helieve, (it is a technical matter) pancity of sites for tanks." You don't apply that to villoge tanks?—No, large tanks.
- 26. Q. To go back to your former place, Gujerat, if in the Dietrict of Broach, for instance, there had been irrigation from the Inpti in the last few years, do you think the people would have availed themselves of it?—Yee, I think they would have tried it, hat I doubt if it would have done yery much good.
- 27. Q. Famins is very rare in Snrat and Broach, what measures do you think would be best to employ for protecting them in case of a famine?—I don't think you can protect Broach.
- 28. Q. Looking further jup at Kaira, Ahmadabsd and the Panch Mahals, there irrigation could be used to any extent?—Yes, in the light coile.
- 29. Q. Could the Sabarmati and Mahi be drawn upon?
  —I dou't think so, I don't know much of these districts, I was there a very short time.
- 30. Q. (Mr. Higham).—You say that irrigation from wells is capable of indefinite extension in this district, is that in all parts of the district?—Yes.
- 31. Q. In regard to the question of advances for them, I see you also say that one reason why they don't apply is, not only is there delay but they don't get as much money as they want; do you mean that they don't get as much money as is necessary to make wells ?—Yee, in some cases.
- 32. Q. Supposing it was decided to take some heroic measures for cucouraging the construction of wells in any taluka, do you think it would be facilitated by putting a special officer on the work, who would have authority to make takavi advances within a certain time; he would be given an establishment for making trial boriugs and that sort of thing, and he would examine on tho spot all applications made and make advances by instalment se work was carried out?—Yes, I think it would be good in a way, but it would he availed of to a very small extent, people ask more for money to deepen wells than to make new ones.
- 33 Q. That would a part of the goneral sebemo; the officer employed would in time become an expert and pass on to another taluka?—I think it would be a good thing.
- 34. Q. You don't think it would be lend to any increase in the number of wells ?—I don't think it would make very much difference. I don't think it would be worth while, on the whole to make special efforts.
- 35. Q. You would avoid the delays of which you speak and you ensure the monoy being speak for the purpose for which it was required, and get a good idea of the money actually required for the purpose P—I think it is only a question of lecal management.
- 36. Q. Local management cen he availed of, but in practice it is not possible, except where you have an officer who takes a special interest in it; supposing n revenue officer, eminently fitted for the work was put ou, do you thick it would he n good plun ?—Yes, I think so.
- 37. Q Do you think it would be sufficient to trust to local cetablishments?—I think they could deal with it.
- 38. Q. Of course the man would be working under the Dietriot Officer, not independently !—It would be worth trying, I think.

- 39. Q. (Mr. Ibbetson).—You say in your memorandum "land is exempt until the expiry of the current revenue settlement which remains in force for 30 years." Is there any exemption beyond that when the ectilement is revised?—I understand that if a well is dag in jarait land, when the new settlement comes round, it is essessed as bagait.
- 40. Q. You say also "remission in cases where the nttempt to obtain water fails chould be, and I believe, is allowed." You are not sure about that?—I have never known a case.
- 41. Q. (Mr. Rajaratna Mdtr.).—You said that nine documents have to be drawn up in connection with the grant of takavi; have you thought which of these could he dispensed with ?—I think all could be dispensed with except the receipt for the money. I think the bouds could he done away with.
- 42. Q. It is that which gives you authority to recover the money?—I believe we have authority without the bonds. We can recover arrears of tokavi like mrears of land revenue,
- 43. Q. (Mr. Ibbetson).—There are us houds taken in Northern India, the land is hypotheented hy means of a morlgage. Do you make a man exceute a formal mortgage?—Yes in 99 cases out of 100 it is deue; you can take personal security.
- 44. Q. (Mr. Rajaratna Mdlr.).—It is n question whether in the absence of that hond Government could recover ou land that was already mortgaged?—If we find that the land has been mortgaged, we do not accept it as security.
- 45. Q. (Mr. Ibbeison).—Are you quite sure about that P.—In practice that is the case.
- 46. Q. Although the law provides that laud revenue should take precedence of that pre-existing mortgage?—I am sare it is the practice.
- 47. Q (Mr. Rajaratna Malr).—Does not the law give the rayat exemption on account of improvements?—I den't think so.
- 48. Q. In paragraph 39 you say "Government might undertake the construction of wells in private holdings charging uothing hut recomping themsolves eventually by the increased bagait assessment." At what I rate would you fix the bagait assessment —It would be fixed according to the ordinary principles, without reference to the ownership of the well or the cost of the well.
- 49. Q. That onbanced assessment covers a certain proportion of the interest; Government has to horrow mousy of 34 per eent., would you adopt that as the limit?—I would ignore everything with reference to the building of the well hy Government.
- 50. Q. In the same paragraph you say "but difficulties would undoubtedly superveue, e.g., the alieustion of parts of the laad commanded by a well?"—I menut to say that the owner of the well itself might refuse to allow other people to use it, although it was originally intended that the land should be covered by the well.
- 51. Q That is a matter for private sattlement; they could always establish their rights; how would the difficulty orise?—It would mean complications I think; for two or three years nobody would he able to use the well.
- 52, Q. Government could recever the mocoy I suppose f—The question I was thinking of was that the person to whom it was alienated might not be able to get the use of the well.
- 53. Q. That is a matter which concerns him and not the Government?  $\sim$  Yes.

WITKESS No. 65 .- The Reverend Mr. H. GATES, Sholapur.

Mr. H. Gates. 4 Jan. 02.

- 1 Q. (The President).—Have you been long resident at Sholapur?—About 25 years.
- 2. Q. You know the district well and have seen it through its times of familio and prosperity. You are resident in Sholnjur itself?—Yes.
- 3. Q. After the experience of these last end years, what do you consider would be the best and most reasonable measure for Government to take, in order to make the physical and moral distress less on the recurrence of a famine?—I have thought of this question considerably and of ways of getting water; there seem to me to be only two ways of getting it: first by raising it from the ground, and, secondly,

hy taking surface water. I think that an improvement is possible in both these ways. I am not confident that much can be done in the way of Artesian wells; the strata of rocks are too level for success; there must be no variation in the under-lying impervious strata; there are some variations in places where water can be more easily obtained than in others, and I think it would be well to find out where these places are so as to help the people to get water. I have not had mach experience in well horing, although an experiment was tried in Sholapur, but it seems to me that if well horing machinery were introduced by Government, trial borings might be made in certain places, eo that the people could find out where they would be likely to find water; if, for instance, eucl machinery were put in the

hands of the Collector, it could be sent to different sections of the Collectorate and trial borings made; and I think it would pay. As for surface water, every year cesans of it goes away into the Siaa and Bhima rivors. India has the largest rainfall of any conutry in the world and suffers near from famine; why cannot we catch the water in some way? In Southsrn India they store water in tanks, there the sarface of the ground is more lovel than it is here, it is easier to take water out of rivers because the rivor beds are shallow; here it can be managed if dams are put across the Sina and Thima river beds and the water turned off and stored in large tanks. I think the water could be used for irrigation, or, if not, it would raise the goueral water-level of the soil. Another schome I have dreamed of for years is to put large dams across the Sahyadri or Western range of meantains, put large dams in the valleys—there is a minfull of 100 to 400 inches and it is of no use to anybody—the land is higher than most of the Decean, and slopes to the east. Why cannot large tanks he made there? I am not an Engineer, hut it seems to me something of that kind might answer. In Mahableshwar, we have had 400 inches of rain, and I have seen places where a dam could he put and where an immense amount of water could be stored. There may be difficulties that I don't see. One Engineer told me that this water would not he very useful near the dams, hecauss there is a pretty good rainfall every year, hut I don't think that is a sufficient objection.

- 4. Q. Do you think that in a year of normal rainfall in this district the rayat would avail himself of each water or water from the tanks?—I think he would.
- 5. Q. Would he take it for his staple dry crops?—He would take it for the crops he thought would pay best—juari or some other.
- 6. Q. There is no question, do you think, that the water would be disposed of? I think not.
- 7. Q. Elsewhere, where there is heavy black cotton soil, we have been assared that the rayat will only under great extremity take water; the works you have suggested would fall on the tax-payer, and it is highly important that some water-rate be paid, not only once in a dezen years but every year?—From all I know of the people, I think they would be glad to take the water.
- 8. Q. (Mr. Ibbetson).—They don't take water from existing tanks in ordinary years at present, that is one of the great difficulties here, why is that ?—Government can answer that question better than I can.
- 9. Q. (The President).—Mr. Beale, would you say that the evidence is souclusive that tank water is not availed of P

- (Mr. Beale) .- I think so.
- 10. Q. (Mr. Ibbetson).—Do you still think that water brought at this onormous cost would, in ordinary years, be used when the water that is there is not used? The people seem anxious to take the water.
- 11. Q. Do they ever give reasons for not using the water that has been provided already at considerable cost?—I don't remember hearing any reasons.
  - 12, Q. You didn't know the fact perhaps ?-No.
- 13. Q. (The President).—I suppose the fact is that in a normal year dry crops require very little more water than the heavens give ?—Yes, but there are lands above the black soil which might require water.
- 14. Q. Take the Ekrak tack, do you think it commands any lands of that description?—Yes, black soil is sometimes found on high lovels and sometimes on low isvels, and between them you will find red soil or moorum soil, which requires more water than black soil, you can raise anything on that, if you have plenty of water.
- 15. Q. From your intimate knowledge of the people, do you find that they appreciate the system of takavi and are glad to avail themselves of it?—I think so.
- 10 Q. Do you hear complaints of the formality to be gone through and of monoy sticking in the fingers of those it passes through?—Yes, I hear frequent complaints, the Patel and other underlings require their fee.
- 17. Q. Do the people go more readily to Government than to the sewer ? -1 think they do.
- 18. Q. You have suggested that the Collector might have boring machinery for testing for sites for wells, have you any other suggestions to make which would accelerate the increase in the number of wells ?—I don't think I have.
- 10. Q. Do you think the amount of interest—it is 6 per cent. in this presidency—deters them?—I don't think that is too high. I think generally people would rather go to Government and deal with Government than with the sowcars, because the sowcars would try to get the fields into their own mea.
- 20 Q. We have had complaints made of the rigidity of the Government payments; it is said they have to be made whatever the season is like, and that the sewer is more or loss pliable; what is your opinion?—I have found that these people always have semething to complain of, any way.
- 21. Q. You don't think they have reasonable grounds for complaint as regards that?—I have not that impression.

WITNESS No. 60.-Mr. GANESH PANDUBANG THAKAR, B.A., District Dopnty Collector, Sholapur.

Answers to printed questions.

2. In my subdivision the areas are as follows :-

Thakar. 4 Jan. 02.

These figures are taken from Mamlatdar's records und are of tvery correct. weterings; but cortainly not so much as in the case of prolonged dronght. not very correct.

The irrigation figures for Minswad Tank are 13,656 acres in 1899-1900 and 3,481 acres in 1895-96 for Pandharpur and Sangola together.

In Pandbarpur and Malsiras the land on the banks of the Bheema is vory rich alluvial land, hat as you go farther towards west it becomes ordinary block soil and then gradually submerges into light muram self-fit for kharif crops only. In Sangola, though the taluka is traversed by the river Man, there are no alluvial deposits on its banks and almost the whole taluga is light muram land of a very inferior quelity. This kied of land is however well soited for un irrigation work to be profitable.

If the rainfull is sufficient and sessonable no artificial or failure of rainful is summered and sessons on a children irrigation would be necessary for ordinary orops. In case of failure of rainful nearly gets would require artificial irrigation. Even in the year of normal minfoll artificial irrigation would increase the productive capacity to a small

Average rainfall is-

				]	aches.	Cents
Pandharp	u <b>r</b>	•		•	25	33
Saugola					23	35
Malsiras			٠.	•	21	82

If the rainfell is normal, there is no demand for ordinary orops in good soil, but in light soil there is always a demand for irrigation water even for ordinary crops, because the normal rainfall is not sufficient to raiss as good erops ac can be roised by the irrigation water. For superior crops there will always be a demand for such water.

Namo of crop.	Number of waterings required.	At what times of the year.
Ground-nut	15 to 20	June to January.
Sweet potato	20 to 25	For 8 months at any time of the year.
Chillies • •	20 to 25	Jnne to December.
Sugarcane .	60 to 60	Throughout the year.
Hoondi	8 to 10	Any time, but naually be tween March and July.
Khapali wheat .	8 to 10	November to February.
Moizs	8 to 10	Any time, but usually be tween March and July and June and September
Vegstables .	20 to 25	At all times according t season.

Distribution of canal water is controlled in the following

Some specific period of time, say, a week or ten doys, is assigned to each group of holdings. The Patkaris or Karkuns appointed for the purpose allow the quantity required for the group to rnn into the brauch channel assigned to the group, and the owners of holdings take the required quantity from the channel. Sometimes the owners of npper holdings take larger quantities and those down helow get less. But usually care is taken that equal distribution is made.

Every year the crops enjoying irrigation are measured and the assessment calculated on them according to the smectioned rates. The revenue is recovered in cosh by the Revenue Department.

3. There are no such tanks; but from the experience of small dams thrown across small streams to collect water for crops requiring more water it would uppear that tasks constructed in black soil will hold water.

When the laud irrigated is a black soil there is some demand, but very slight, for water oven during sessons of normal rainfall for crops requiring regular and frequent

In such soil the irrigated area does show a falling off in years of fair rainfall.

The revenue is more precarious.

No. Not much desire if the rainfall he normal.

No.

4. The information required in this question would be hest given by the Irrigation Department.

There are only two canals in my charge, Mhaswad and

The estimated annual irrigating capacity of the former is, I think, 106,000 acres, but there being some defects at the headwork and in the lice, the present actual capacity is, I think, only 27,000 acree. I have no information about the other tank.

To a considerable extent, especially in the case of Mbsswad Tank, its catchment area being very large.

My information is that there is one good site for a tank on the river Bheema near Shankargaun on the river Man near Nuzors and on the river Nira near Kurhavi. Thoro are also good sites on the smaller strenms, one near Sanond, one accor Nimgnon, one near Gardi, and one near Woki.

I heg to soggest the folling conrece of irrigotion :

- (a) The leakago water of Mhoswad Cooal runs through ne leakago water of allosswad Cooli russ through some streams in large quantities. Small mesonry dams may be thrown on them at conveniont sites, and the running water utilized for irrigation. The cost will not be more than 1,000 to 1,500 rupees in each case, and the works con be outrusted to the Local Boards.
- (b) At convenient sites small storage tenks may be constructed and they may be filled by feeder cannle by the water of the Man River which escapes through the wasto weir during measons. These small tanks will be able to irrigate, say, 200 to 500 acres in each case.

I beg here to suggest that land-holders should be eucouraged to make their fields level and to throw small dams around them as in the Konkoa, so as to retain and turn to account every drop of water falling from the skies. At present the laods are so sloping and rough thet mob of the water of a heavy shower—main usually falls in such shower in this part—rune over the ground and is wasted.

- 5. No provincial works in my charge.
- 6. No such works in my charge.

There are a few kachcha bandharas or temporary water courses earrying a small quantity of weter to lauds. The holders enjoying the irrigation throw an earthern dam every year and carry water. If the water fails remissions are granted. There is no responsibility on Government for their up-keep. These may be made into masonry bandharas and new ones constructed as suggested under reals. and new ours constructed as suggested under reply.

4. These will be very useful as protective works. Their value concerning villege water-supply will not be much. Small tanks dependent on fainfall constructed as villege, works will not be of much use for irrigation. They are not wanted for men or cattle as the wants of the latter are otherwise satisfied.

7. Total nren irrigated by well :-

Tn	loka.		In ordinary yoars.	In years of drought.	
				As.	As.

- All by tagai ; 47 more by private capital.
- † 102 by tagai during the last ten years. Number constructed by private capital not yet known.
  - # Half by tagai and helf by private capital.

It is desirable to encourage well construction by larger

No cencessions other than those given in the rules were allowed except in the lost two famice years, when partial exemption from interest and postponoment of repayment were granted. Almost all the wells were affected more or less by the dronght of 1899 to 1901, but many of them ontained some water which was sufficient to raise ordinary foed crops instead of rieber crops.

Yes. Many were deepened and the deepening was generally successful in obtaining more water.

Number fuiled or abandoned.

Information not available. I think about 15 to 25 per cent. of the whole number.

30 to 40 feet below surface.

Cost from 500 to 700 rapees.

Area served-about 10 neres for middle class; 2 for saperior and 15 for ordinary crop.

8. There are no parts to my knowledge in which lands or crops are injured by water-logging. No drainage work required any whore.

required any whore.

There is however a popular complainant that the canal water injuriously affects richer lands and makes them unproductive after a continuous irrigation for 10 or 15 years. According to their ideas the land-holders explain the phenomenon by saying that the canal water being stagmant is colder than, and therefore not so healthy to crops as, well water. I am not satisfied with this explaination. I do not understand why stagmant water should deprive the land of its productive capacity more rapidly or completely than well water. What I think the reason of canal water impairing the productive capacity to be is thet it is given to lend indiscriminately in much larger quantites than the well water, being less expensive and more abundthan the well water, being less expensive and more abundant. The lands seak it to a great depth where the moistare remains undried, being beyond the reach of the surface

sun-hent. It is said that the saline efflorescence begins low down underground and gradually rises up to the sarface. This ovil result can, I think, be avoided if a smoller quantity is allowed than at present either by reducing the quantity given at each time or by making the waterings less frequent.

General desciency of meaure is another cause. Manne is very costly and scarce in these parts and is consequently not given to lands in such large quantities as are necessary to replenish their productive capacity which is being rapidly deteriorated by the continuous caltivation of saperior crops which being more profitable the land-holders are induced to make without intermission or variation. If a cheap and lessally procurable artificial manure can be suggested this defset can be remedied to a great extent.

9. In the last two years' famine two irrigation tanks the

9. In the last two years' famine two irrigation tanks, the mstelling of three roads, and the repair of one villege tank were undertaken. They are completed except the two now irrigation works. It seems most desirable to bring about their early completion as they will be of mach use in generally improving the condition of the sarrounding country apart from their great value as protective works in times of drought. No village tanks constructed. No experience is yet gained about the Karkump Tank; but there is much room to hope that it will romove the present great scarrity of water felt at thest place, and fill with water all the sarrounding irrigation wolls which had become almost dry during the last two years.

14. Protective value of the two irrigation works in the 9. In the last two years' famine two irrigation tanks, the

14. Protective value of the two irrigation works in the famine sines 1897 has been considerable.

Arons irrigated are as follows :-

	Year.				Mhsswad Canal.	Ashti Canal.						
					As.							
189ā·96		•	•		3,481							
1896-97		•	•		7,547	ined						
1897-98			•		6,133	Not obtained.						
1898-99			•		6,101	Not						
1899-00		•			13,656							
1900-01		•	•	•	5,842							

It was the failure of the water, not the unwillingness of the people, that has so much curtailed the irrigation area in 1900-01.

Some persons went on relief work and some were also on dole in the villages protected by irrigation works. But the proportion was considerably small. Had the works been not in operation abent 10 to 15 per cent. more of the village population would have sought for relief.

villago population would bave sought for relief.

Comparing an irrigation work with wells lot us take Masswad Tank. The initial cost is about 20 lakhs. A well ordicarily costs Rs. 500, so there will be about 4,000 wells by sponding 20 lakhs. About 25 per cent. will fail or have scanty water. The remaining 3,000 will irrigate about 30,000 nores of ordinary crops, whereas the capacity of the Mhaswad Tank is estimated at 106,000 acres with a more profase supply of water than well water; besides, no cost of lift us in the case of wells. In this respect irrigotion works are more advantageous; on the other hand, the tion works are more advantegeous: on the other band, the lend becomes peorer by saline efflorescence, which is nover the case in well-irrigation.

- 1. Q. (The President.)—How long have you been in this district ?—Two years.
  - 2. Q. Where were you hafore !- In Kolaba.
- 3. Q. There are three talakas in year cherge?-Yes; Pandharpur, Sangola, and Malsiras.
- 4. Q. The first-nomed is ander the Mhasvad tank !- Yes, and also a part of Sangola.
- 5. Q. The increase in irrigation under this tank is due to the drought. When the drought ceases I suppose the figures will go back to those of normal years ?—No, the people see the odvantage of irrigating rice and other supe-
- rior orops, such as ground-nats and sweet potatoes and they are not likely now to go back to the old state of things.
- 6. Q. Is the Mhesyad tank capable of farther extension for irrigation ?—I am not able to offer an of opinion as I am not an Engineer, but have beard that if certain repairs to the tank were carried out its espacity could be increased.
- 7. Q. Is there much water in the Bhima jast any ?No, it may have 9 inches or a foot.
- 8. Q. Is there a large amount of irrigation direct from its banks P-−No.
- 9. Q. Noithor by mot nor well ?—I don't think the Bhima is saited for mot irrigation on the banks.

Thokar. 4 Jan. 02. Mr. Thakar. 4 Jan. 02,

- 10. Q. Why?—The banks are very steep and mot irrigation would be too expansive.
- 11. Q. Are they too high? -Yes; and besides it is a very silty soil, it is not suited for making wells for taking up the water. The Mend river is much mere suitable.
- 12. Q. (Mr. Ibbetson.)—Is there much water in the Mand rivor P—Yes, under-soil water; wherever it is possible, they sink wells.
- 13. Q. As to irrigation under the Mhasvad tank have cultivators to apply before taking water ?—Yes.
  - 14. Q. Have they to apply for every crop ?-Yes.
- 15. Q. To whom it the application made?—Either to the Subordinuts Engineering officer or to the Executive Engineer; ultimately the applications have to go for senetion to the Executive Engineer.
- 16. Q. How long does it take for a man who makes an application to receive a reply ?—About 5 to 80 days, but the applicant generally sends his application in time to allow for that.
  - 17. Q. Bscauss he knows the diffiedlties ?-Ycs.
- 18. Q. Do you think there would be any extension of irrigation if the application oystem were abolished !— What good will that do!
- 19. Q. The rayat would got water earlier ?—I have not etudied that view of the question, but I don't think that would do much good, because the people in oar district are rather dishouest and they might take more water than they are entitled to.
- 20. Q. But they will have to pay for it?—Yes, that is trus; but there would be quorrels as every man would want to have his own way.
- 21. Q. That is the system purened very largely in other parts of India f—Yes, as far as I know. But here application is only n formality. The application goes to the Executive Engineer and he sanctious it.
- 22. Q. Is there any good in it?—Yes, one thing is that the village officers are made to sign the application as colluteral securities for the due payment of the water tux.
  - 23. Q. That is quite usual ?-Yes.
- 24. Q. Do the people take water year after year?—Yes cometimes one oultivator sometimes another, but they all take water.
- 25. Q. You spoke just now of scenrity being taken ?—
  It is a formal thing; the village officers are required to sign the application. The cultivator pays the water rate generally.
- 26. Q. You say, "svery year the crops are measured. The revenne is recovered in each by the Revenue Department." Is a large amount not recovered?—I don't think; nost of the mone, is recovered. I don't think there would be any serious harm in obolishing the system of application in the case of high class corps.
- 27. Q Do you consider that the black soil of the district is generally favourable for prigation ?—No, only red soil is irrigated.
- 28. Q. In normal years would they take irrigation is any other soil f-Yes, black soil, which is not very deep with a substratum of muram will take water.
- 29. Q. What sort of soil is that irrigoted under the Mhasvad tank ?—It is muram; almost the whole of it; a very little is rich black soil.
- 30. Q I gather that the people who have had irrigation throughout the district these last few years go on taking irrigation?—Yes.
- 31 Q. Would that hold good in black soil?—Yes, for soms crops
- 32. Q. You say in page 3, my information is that there is one good site for a tonk on the river Bhima—and on the river Nosra. There are also good sites on the smeller streams. Do you know any of these sites? Have they been oxamined by the Enginer?—I think they were examined some 20 years ago when the site for the Ekruk tank was selected; some 2 or 3 other sites were also examined.
- 33. Q. And objected to ?-Yes, I don't know what the reason was.
- 34. Q. You say at the bottom of page 3, "I heg here to euggest that land-holders obould be encouraged to moke their fields level and to throw small dams around them as in the Konkau." How are they encouraged in the Konkan? Do they get takavi?—They do it rolnutarily because ries crope cannot be successfully raised unless there are dams and the soil levelled.

- 35. Q. How are you going to put pressure upon them here?—I should like to put pressure on them in their own laterests.
- 36. Q. What pressure? Refusal of water until the work is done?—I refer not only to irrigated lands but to all lauds. Famine labour might be employed for the purpose and something might be recovered from the owners.
  - 37. Q. Have you experience of famine labour?-Yes.
- 38. Q. Do you think that it would be n good form of famine labour?—Yee, if the dam work is properly supervised; my ldsa is that it would stop the present waste of weter. I know of soms peopls who have volunterily put np small dams and they got good crops even in famine times.
- 39. Q. What sort of enconragement would you give for well irrigation?—With regard to the distribution of takavi, I think we must have a separate agency, a regular establishment for the payment of leaus.
- 40. Q. Do you think the present establishment is too busy?—Yes; a mamletdar of lowest grade or a hosd karknu of the highest grade would do.
- 41. Q. Do you mean one for each district?—One for each taluka or two talukas at the most.
  - 42. Q. It would not go ou always?-Yes, it would.
- 48. Q. Takavi advances would not be required in each taluka year after year?—For well improvement and woll construction there would always be demand for some years. That, of course, would depend on the circumstances. My idea is that a separate officer must be appointed for that work. He would be part of the Revenue establishment.
- work. Ho would be part of the account of the time being?—Yes. He will have to make snquiries. The Record of Rights will simplify matters; there will not be so much difficulty in ascertaining the value of the security.
- 45 Q. Do you think the people will go on making wolls?
  —Yes. In some parts the well-bearing capacity of the lend has been exhausted, but where there is still scope the people will make wolls.
- 46. Q. What is the case in regard to those parts where the well-bearing capacity has been exhausted?—I'bore, you will find very few places now at which water can be tapped at reasonable depth or at a ressonable cost. My idea is that water can be tapped in the valleys and lower grounds only; as you go up, the difficulty and expense of getting water are enormously increased.
- 47. Q.—Some of the valleys are now fully occupied by wells?—Yes. There is uncertainty about tapping water higher up; that is a great obstacle.
- 48. Q. (President),—Supposing Government were to say, spend what you like in takavi, how much would be the increase in the area irrigated by wells?—My estimate is that it would be almost 5 times the present area.
- 49. Q. The present area waterel by wells is about 15,000 acres ?—Yes, in each of Sangola and Malaines talukas and about 10,000 in Pandhorpur.
- 50. Q. Do you think it could be increased to five times that amount?—Yes, that is the maximum.
- 51. Q. (Mr. Ibbetson).—Fifteen thousand acros for the whole district?—No, for one taluks (Molsims) only.
- 52. Q. (The President.)—What proportion of land generally out be watered by wells?—I cannot give the percutoge.
- 53. Q. Do you think that in Sangola and Pandharpur the arce can be increased five times?—In Sangola taluka the increase would be about the same. In Pandharpur probably less then that.
- 54 Q. (Mr. Ibbetson).—There you do not think the increase would be five times for the whole district?—No.
- 55. Q (The President).—In these two talakas 24,000 acres opuld be irrigated?—Yes, ont of a total area of 700,000.
- 56. Q. The cultivated once of the two talukas is only 580,000?—Yes.
- 57. Q. You could irrigate 1th of the oulturable area? -- No, ubout 12th.
- 58. Q. Do you think in Pandharpur it would be less ? -Yes.
- No; I was speaking about the uncertainty of finding water. The people do not know where water is to be found and so sometimes the taken imoney is speat and there is no well. It would be a great thing if Government were to remit the amount altogether in ouch cases.

- 60. Q. If water is not found ?—Yes, that would be hailed with great joy by the people.
- 61. Q. You do not think that a man who get takavi would say, "I cannot find water" and spead the money on another object?—No. Government would not lose anything. Boring was tried in the last famine, but not to such an extent as onglet to have been done. Government should in every case, send their own officers to select the site, and if good water is found all the onlivators would readily make wells.
- 62. Q. Yon say in paragraph 7, "it is desirable to oucourage well construction by larger advances." Do you
  mean by giving a larger proportion to a man who asks for
  if or by Government giving eaough for the district?—The
  cultivator in our district gets as much as he wants, but if
  we gave them larger sums of money at the risk of some loss
  well construction would be encouraged very mach. I don't
  complain that sufficient sums are not allotted for the district; we get the mency, but there is not much enterprise
  among the people. among the people.
- 63. Q. Do you think much would be done if Government redoced the rate of interest?—I don't think so. The people don't desire anything in that direction; they are quite satisfied with the rate.
- 64. Q. Are they content with the number of years within which they have to pay back the sum?—I think that the period should be increased to a certain extent.
- 65. Q. How much ?-To 30 years; it may be made ooucorrect with the Survey-settlement period.
- 66. Q. That may be only five years !—If takaci is made a part of the assessment that would he, I think, a good plan
- · 67. Q. (Mr. Higham)—Do you know whother a good many small village tanks were constructed in your charge in the famine of 1877-78 ?—I don't know. I was not here at that time, but from what I see I do not think that many were made.
- 68. Q. We have it in evidence that a great many were constructed but are now out of use?—Unless the statistics are collected I cannot say.
- 69. Q. You say that a very small proportion of people went on relief works from the villages that are protested by irrigation. What was the general proportion that went on to relief in other villages?—From 25 per cent. to 33 per cout.
  - 70. Q. For how long ?-Almost the whole year.
  - 71. Q. Which your are you speaking of P-Of 1900.
- 72. Q. Where the villages were protected by cauals, some of the villagers also went on to relief?—Yos, in some villages some people did, in some they did not go. Where they did go the percentage was, I think, 5 per cent. to 10 or 11 per cent.
- 73. Q. Some of them did not go at all f—No; even in the number receiving doles there was a marked difference; the people receiving doles is irrigated villages were very
- 74. Q. In the villages in which relief was applied for what proportion of the culturable area protected by irrigation, was irrigated ?—1 think 20 per cent.; I am not at all sure, but it would be about 20 per cent.
- 75. Q. Where one-fifth of the area was protected people did not go on relief works !- No, that is my idea.
- 76, Q. I suppose in some of these villages a great deal more than 20 per cent. is protected ?-Yes.
- 77. Q. I don't think they irrigate more than 25 per cent-of the oulturable area in ordinary years?—They use water for high-class crops and not for juari and bajri if there is a good rainfall.
- 78. Q. Of higher crops they only irrigate a small proportium ?—You.
- 70. Q. (The President)—Do they irrigate sugarcano?—No, only groand-nots and sweet potatoes, which are middle class crope—not very high, and not very low.
- SO. Q. Is no sugarcane grown f-Yes, there is. In my charge there is a small area under sugarcane; it requires a vory large quantity of water.
- 81. Q. (Mr. Higham)—In dry years, wore there any villages in which half the culturable area was irrigated ?— Unices I see the figures I cannot answer the question.
- 82. Q. Are any statistics kent P.—Probably some might be found in the Agricultural Inspector's office.
- 83. Q. You say the Mhasvad Tank will irrigate 100,000 acree; where did you get these figures from t-From the

- statistical atlas of the Bombay Presidency that was propared sometime age.
- 84. Q. They never irrigate anything like 106,000 ?-No; practically only 12,000 or 13,000.
  - 85. Q. You irrigated 13,000 in 1899?-Yes.
- 86. Q. That is the most that has ever been done?—Yes; not more than that.
- 87. Q. The average, is about 0,500 ?—Yee; my impression is that the capacity could be increased if some improvements were carried out.
- 88. Q. De you sappose that if something is done to improve it will irrigate 108,000?—Ne; not more than 27,003; 106,000 acree is only the Engineer's estimate.
- 83. Q. That is four or five times more than you irrigate at present ?-No, two times.
- 90. Q. As matters stand at present that does not compare at all favourably with wells?—If the full capacity could be got then I think 4,000 wells would not give as much water
- 91. Q. (Mr. Bajaratna Malr.)—How many applica-tions for takawi did you receive in your Divisium during the last two famines P.—More than 1,000.
- 92. Q. In ordinary years how many do you receive? About 150 or 50 for each taluka.
- 93. Q. Don't you think that the existing staff should have been able to deal with them f—Well, they could have, but not in time to be of any use: that is the difficulty.
- 94. Q. Why should there be any difficulty; the Mamlatdar goce about and makes enquiries?-"There would be no difficulty if the Mamhatdar want roam promptly, but he has other pressing busiaess; sometimes he has magisterial work or an omergent report to write; these cause a delay to some extent in the disposal of applications. And then again a man's bond fieles has to be onquired into.
- 95. Q. You could get information of ononmbrances on the land from the negistrar's office?—Sometimes they don't register the mortgages.
- 90. Q. Then they are not valid P-No; in some cases they are not.
- 97. Q. In other cases a registered document is not valid and is no better than an unregistered document P. No, a registered document is better than an unregistered document; but in some cases the land is transferred to rolatives or sub-sharors by a private sottlement, without a doeument.
- 93. Q. I sappose Registrars could give you the information in a few days?—It would take a week, as the registers are not well kept. Then the caltivator might have mortgaged it so long as 50 years ago.
- 99. Q. Special efficers were appointed during the famine to grant takeri !—Yes.
- 100. Q. With reference to the system of applications for water, is there any cortainty under the present system that a rayat who gots water in one year will get it again next year?—There is no certainty; it depends upon the sanction of the Executive Engineer; he may sanction whichever application he likes.
- 101. Q. Does not that to some extent prevent a rayat from sinking a woll to supplement canal irrigation?—No; well irrigation is always considered by the people to be more
- 102. Q. But I refer to wells built to supplement oanal irrigation?—The soil that is favourable for canal irrigation is equally favourable for well irrigation.
- 103. Q. What I you mean is that for high class crops irrigation is required?—Yes.
- 104. Q. In some tanks and causls irrigation is likely to fail daring some months?—Yos.

  105. Q. To supplement irrigation in these menths would not the rayer sins a well if he was certain that the causl would fail !- Yes, if the soil is favourable.
- 106. Q. Assuming it is favourable ?-Y-s, but we thereby give the man who does that the monopoly and deprive others of the benefits of the tank irrigation. Sometimes we give water to one man, sometimes to another, according to who needs it must.
- 107. Q. Could you not allet a definite area to each individual once for all and class it as wet in all ordinary years?—That can be done; but without experience I cannot say whether it will be to the advantage of the rayat or not.
- 108. Q. Why should there be any doubt upon that point?
  -The quantity of water in the tank varies and semetimes there is more to give than sufficient fur the limited area that may be fixed.

Mr. Thakar. 4 Jan. 02. Mr. Thakar. 4 Jan. 02.

- 109. Q. He could apply for an additional area and pay more. When there is a deficiency of supply the Canal officers give n reduced quantity?—Yes, sometimes the water is only sofficient for the caltivation of orops near the caual and the supply has to be restricted accordingly. Moreover, if, under the fixed area system, the whole of such area is planted with sach crops requiring large quantities of water in a year of drought, the whole quantity in the tank, which could more neefelly be utilized for raising food-grain crops will be obsorbed by the higher crops.

  110. Q. In times of drought you restrict the area proper-
- 110. Q. In times of drought you restrict the area proportionately?—Yes; the available water is turned to the best advantage for growing food-grain crops. However, some such arrangement as you suggest might be tried for 3 or 4 years in the parts where search; is experienced.
- 111. Q. In perograph 3 you say, "from the experience of small dams thrown across small streams to collect water for crops requiring more water it would appear that tanks constructed in black soil will hold water." Have you personal experience of this?—No.
- 112. Q. Are the soggestions you make in your memarandnm heing carried out?—I think they are boing given definite shape to in the office of the Executive Engineer.
- 118. Q. Do you know if ou enhanced a eessment will be charged at the next revision of settlement on load irrigated by now wells P—No; I don't think anything extra will be charged, because it is an improvement made by private capital.
- 114. Q. If the class of cultivation is changed the assessment is increased?—Yes, only if the nature of the soil is changed by patting manure, by levelling the ground, etc., which is necessary in an irrigated plot; but the water-advantage is not taxed as each.
- 115. Q. Are you in fevour of Guvernment making n well and charging on enhanced assessment?—No, I think the construction of wells should be left to the people; the only part that I would recommend Gavernment to take in well construction is to find out and tap the water for the rayat. The rest should be left to the caltivators themselves.

### TWENTY-SEVENTH DAY.

### Bijapur, 6th January 1902.

WITKESS No. 67.-Mn. W. W. DREW, I.C.S., Collector of Bijapur.

Memo. by witness.

M. II. IV.
Drew,

- 1. This District is constantly suffering from feilure of oreps. From 1863-76 there were five or six bad years. Then followed sixteen years of abnormal presperity, but, to make up, the crops have failed five times during the latest eleven years, and there is no reason, that I see, to anticipate that it will fare very mach better in the future, apart from irrigation. In 1896-97 the lete rains completely failed, and in 1899-1900 there was practically no kharif rain, though there was a very heavy fall oarly in September. In the other three years the minfall was not short by more then a very few inches below the average, and yet there was conceining like a 2-anna crop only. This was because the land bere must get not only its average fall almost to an inch, but it must get it at exactly the right moment. The soil ovidently cannot get on, as it used to with a minfall sughtly short of its average. It has been exhausted, as it nover gets monnred.
- 2. The first necessity is to stimulate the rainfall. In 1891 a quantity of dynamito was exploded with this object, but it was done when there was an absolutely clear sky, and naturally there was no result. During the last two measons it looked almost daily as it is meased to cook down in torrents, but the clouds used to pass over simply because there was nothing to bring down the rain. So I recommend that tree planting be undottaken on a large scale. Nothing has been done by the Furest Department here so for. Planting and watering trees might form part of the famias programms too. Suitable places could be found where there would be sufficient water for both trees and workers.
- workers.

  3. Next I think that no unoccupied land should ever be given out without on egreement being taken that the intending occupant will make wells capable of irrigating a half or some other fixed proportion of it. The full assessment of the land is 14 lakhs. In the last two yeers n total of 19½ lakhs was collected, of which 3 lakhs were due to the scare consed by the sudden introduction of the Land Revenue Code Amendment Bill. This year I do not expect to collect more than 5½ lakhs. The cost of relief works, almost entirely nnremunerative, and of grantions relief has been 11½ lakhs in the lost two years, and it will be at a moderate estimate 4 lakbs this year. The uncollected revenue may some of it he eventually collected, but the greater portion will certainly have to be romitted. Eight and helf lakhs have been advanced as Tagni for seed and cattle, of which 2½ lakhs are recommended for remission; and there will be great difficulty in recovering the remainder. So the famine expenditure has been 24 lakhs egainst an income from Land Revenue of 25½. Therefore it is not very profitable to Government to have the land in this District enlitivated as long os it reteams unitrigated, Nor is it to the occupants. They exist only through charity. For better would it be for them to eeck land

- where caltivation is not so precarious. Land unsuited to irrigation or which nobody will take up I would add to the forests. Even if not immediately productive, it would at any rate not increase the number of mouths to be fed in the next year of searcity; oud would afford employment.
- the next yeer of searcity; ond would afford employment.

  4. Speaking as a mon with no protence to eccentific knowledge, I think, that wells are far more suitable to this district than tonks. The only modern tank, at Aluch-kundl near Begalkot, which cost about a likh, is altogether unrommerative, and irrigates only about 40 neres. For it an extra rate is paid by those using the water according to the aereage for which it is used. Other Government works, for which a consolidated rate is paid, irrigate about 1,410 acree, villege and private works 2,200 acres. Fifteenthousand and eight hundred acres are irrigated by welle. The total cultumble erea is 3,227,000 acres. In the lest two years most of the tanks ran quite dry, and they were useless, even for supplying water to the wells by percolation. The beds were given out for caltivation in at least three cases. The large tanks, Sangogi in Iudi tálnka and Hullar in Maddebihal, which ere now being constructed as famino relief works, should, I think, be completed, as so much has already been spent on them, and their catebment area is so great that they would not run dry in any year with as much rain as the recent famino years. Bet smaller tanks, I would not recommend, except as relief works during actual famino.
- 5. We'ls must be constituted by the people themselves, with help from Government. They can do them mach made cheaply than Government cae. They would be suspicious of Government doing work for them on their lands. They would imagine some deep laid sebeme to oust them.
- would imagine some deep laid sebeme to oust them.

  6. More liberal takavi advances might be givee, provided that the work is rarefally watched and the whole advance is not made at eace. To begin with, only enough to each be the recipient to find water should he advanced. When that is spent, if water hes not been found, but the measy has been bonestly spent and there is reasonable chance of its being found, more might be advanced. Money fruitlessly spent in this way might be remitted, even though water were eventually found, and where after diligent search it had to he abandoned, it should always be remitted. Some officials undervalue the security offered, and forget that as the work progresses the value of the security increases. By giving the loan in iastalments a sum safficient for the most pakka well can be advanced with safety. A supply of the best boring apparatus should be kept of the head-quarters of every talaka for the use of rayats requiring them, the hire being treated as part of the advance. This would be especially aseful for deepening wells. The present rate of interest need not be changed, nor need there be more liberal reasissions, except when water is not found. But I would extend the period for

6 Jan. 02.

re-payment to 20 years, so that some of the burden may be borne by the next generation, and to cause inducements to keep up the wells. There is always a tendency not to use a well in a year of abundant rainfall, and, if by any good fortune there is a run of these, the wells fall into discepnix. Last year there were 132 more irrigation wells in the district than five years previously, but there were 68 more in disuse, and of kachcha wells there were nearly 400 more in disuse. It might be made a condition of the lean that not only was the work to be completed in a certain time, as is the practice new, but that it should be kept in good working order till at least the date for repayment of

the last iosialment. It seems to me that it is the best soils Mr. W W. that require the deepost wells and also that suffer most by Drck. a season of seanty rain, and the occupants of those want

a season of sennty rain, and the occupants of those want special oncouragement to sink them. This can be offected best by liberal loans repayable in an extended period.

7. Doubtless a large number of wells ran dry during the last two -yeure, but many continued all through with somewhat diminished supply. Some were despende. Others coold have been, if imploments had been more largely availables. Those that continued were the saving of the District. They inferded work to many and grew much needed grain and still more needed fedder. needed grain and still more needed fodder.

- 1. Q. (The President)—You have been Collector of Bijapur for two years?—Yes; I came here just two years ago at the beginning of famino.
- 2. Q. Do you know the district very well?—Yes; a good deal of my time was spent in connection with the tamine.
- 3. Q. Have you only seen this district during its had times !-- Kin; I was here as Assistant Collector for a year about 13 years ago.
- 4. Q. You say that there were 16 years of abnormal prosperity ?—Yes, 16 years without inmine; there was scarcely such a time before.
- 6. Q. The famine of 1877-78 was terrible ?--Yes; it was the worst on record, but the 1896 famine was very had.
- G. Q. You say "Nothing has been done by the Forest Department here so far. Planting and watering trees might form part of the famine programme." Do you think trees would grow well in this district?—Yes; I know that in Bijapur there were no trees in my compound 15 years ago, but there are a great number now. Trees grow well without much care, but they must be planted near water. near water.
- 7. Q. You propose that "No unoccupied land should ever be given out without an agreement being taken that the intending occupant will make wells capable of irrigating a half or some other fixed proportion of it." Is an application made before ecoupying land?-That was not the system in my time.
- 8. Q. Do you think there would be such a demand for agricultural land in this district as would induce people to make such an agreement?—I think, if they were given taken and told that they would not have the land if they did not protect it by wells as proposed in my memo, they would do it.
- 9. Q. You say "In the last two years a total of 192 lakks was collected of which three lakes were due to the scare caused by the sudden introduction of the Land Revonus Code Amendment Bill"?—Yos; out of 28 lakes.
- 10. Q. You say that cost of gratuitous rollef has been 113 lakhs?-Yes; we find that on the whole we have spent five lakhe more than our income from all sources during the last two years.
- 11. Q. You say "Wells are far more suitable to the district than tanks." What is the variation in the depth of wells !—They are not often deeper than 60 feet.
- 12. Q. (Mr. Ibbetson)-Often less ?-Yes; 30 feet I think somotimes.
- 13. Q. (The President)—Do you find brackish water in these wells?—Yes; in particular parts.
- 14. Q. In large parts of the district !-Yes; a good deal, I think.
- 15. Q. Are wells cut through trap rock?—Yes boriugn great deal of deepening has been done lately.
- 16. Q. Do you consider that a larger area could be cultivated if there were wells P—Yes; but they do not use wells in a good year as it does not pay them.
- 17. Q. Do the people grow higher class crops under wells P—Yes; vegetables and semetimes a little angarcane.
- Q. Is there much black soil in the district? -I think that there is a good doal mare black soil than the other soils in the culturable area, but I am not certain.
- 19. Q. You say the Muchkundi tank is quite unremunerative and irrigates only 40 acres. What other Government works are there?—There are some old works. There is the Mudag tank; which belongs to the Muhamedan times; it is irrigation tank; and under it the people pay a consolidated rate; altogether it irrigates only 1,440 acres?

- 20. Q. Are there any village and private works ?-Yes;
- 21. Q. (Mr. Muir Mackenzie)-In what part of the district ?-I cannot remember having secouny of them.
- 22. Q. Are there any rice tanks ?-No; I think they grow vegetables.
- 23. Q. (The President)—The Muchkundi tank has been a great failure !-- Yrs ; I think so.
- 24. Q. You recommend that the large tanks in Sangeri and Hatlar should be completed ?- Yes, I think so; as we have spent so much on them.
- 25. Q. Are they preity well advanced?—The Sangogi is well advanced, the other not so far.
- 26. Q. Noue of the saperstructures have been completed?-No; none at all.
- 27 Q. The capacity of the tank will be 2,845 million on bic feet?—Yes.
- 28. Q. You say more liberal takavi advances might be given provided that the work is carefully watched and the whole advance is not made at once ?—Yes, but I would spread the re-payment over a longer time. I would show a good deal of liberality.
  - 29. Q. What is the present period?-Ten years.
- 30. Q. You bave provision to allow more in the Code?-
- 31. Q. (Alr. Muir-Mackenzie)—You cannot exceed 20 years without the sanction of Government ?—No.
- 32. Q (The President)—We find that every where the full period is not allowed?—I think that 10 years are usually granted.
- 33. Q. Do you think 20 years long enough?—Yes, except in some places where it may be raised to 25 years.
- 34. Q. (Mr Higham)-Could you give 20 years now? Inm not sure.
- 35. Q. (The President)—You say "last year there were 132 more irrigation wells dug in the district than five years previously?"—I got that from the returns.
- 36. Q. Of kachcha wells nearly 400 remained disused? Were they not deep enough?—I think they were silted up.
- 27. Q. The high rates obtained last year for erop produce ought to make them exert themselves the more to work their wells?—Yes, those who used them found themselves benefited.
- 38. Q. Is the aren under well irrigation falling off P-I should not have thought so.
  - 30. Q. Have you the figures?-No.
- 40. Q. I think the high rate created a very great inducement to increase well irrigation?—Yes; I think so.
- 41. Q. In this district there are very few wells com-pared with others? It is a very small number indeed.
- 42. Q. (Mr. Higham)—You say irrigation is not resorted to under the Muchkundi tank by the people; why is that?— I think they are afraid water will not last if they commence to take it for percunial crops.
- 43. Q. I see from one of the statements, propared by you that there is invariably some water left?—I should say they do not care about it; they prefer the ordinary dry
- 44. Q. Would not that upply to any new tank that might be made?—Yes; I think, it will deduct from its paying capacity cortainly.
- 45. Q. Is the water-rate you charge too high P-No; I think the ordinary rate is Rs. 2. I do not think it is too much. I do not think that lewering would induce many more people to take it.

there are a few.

2 P 2

Mr. W. W. Drew,

- 46. Q. Oo second class warks of which the management is left to the cacple, do they take water every year?—Yes, because they have to poy whether they take it or not.
- 47. Q. Do you think it is possible to put such works os the Muchkundi tank on the sume basis?—I do not think wo could do that under the present law.
- 48. Q. Is the tank a paying one?—Nuthing like it; it does not poy the expanses.
- 40. Q. Why not allow people to manage the Much-kundi tunk themselves !—I don't think they would keep it io good order.
- 50 Q. There canld not be much risk in making the experiment?—No.
- 51. Q. So far os your experisneo goes in this district the people are reluctant to toke the water !—Yes; thay certainly are.
- 52. Q. There is no reason to suppose it would be utherwise if you made new trucks?—I don't think it would unless a consolidated rate is pot un.
- 53. Q. At the next settlement or at once ?-I chould say of the next settlement.
- 54. Q. Would people like that or would they prefer to pry a water-rate?—I think if they had the chaice they would prefer a water-rate. They could then take water when they liked.
- 65. Q. Do you think irrigation tanks ore mure likely to be developed if you put on a consolidated rate?—Yes.
- 56. Q. (Mr. Ibbetson)—Do you think that the people refuse to take the water from the mere fact that they are not sure that the water-supply will last?—I think that io partly the reason.
- 57. Q. Do you think that is mainly the cause?—I think so; in time they will be accostumed to a tank supply.
- 58. Q. At present they get water from wells which last all the year round?—Yes, in bad years the tooks run dry.
- 50. Q. In ordinary years, in a year of average rainfall, have you any storage which water laste throughout the year basides wells ?—Yeo; I think the water of one canal laste through the year.
  - 60. Q. Up to June?—Yes; quite up to June.
- 61. Q. Do you know what the people grow mainly?—Vegetables.
  - 62. Q. High-class crop f-Yes.
- 63. Q. Do they use the unter every year in ordinary years i-Yes.
- 61. Q. Under wells in ordinary years do they water dry crops at oll?—I am afraid, I don't know.
  - 65. Q. In famioo years they do so ?-Yeo; a great deal.
- 66. Q. You say a great number of wolls lie disused?—
- 67. Q. If n man has laid unt his capital in preparing the land for cultivation of high class crops, do you think he allows his wall to go out of use?—I think his descendants don't use it.
- 68. Q. Could you say from your observations during thase past two years how far well-irrigation prevented people from going an relief works?—It did so to a very large extent indeed.
- 69. Q. Have you noticed a marked difference between the villages whose well-irrigatian exists and those where it does not 9-Xes; a great deal of difference.
- 70. Q. Does that apply to villages under tanks?—No, there was hardly ony water in the tanks.
- 71. Q. It is mainly in the villages noder wells?—Yes; the water in wells near tanks lasted for o long time.
- 72. Q. Da yoo think that in any villages or villages that you know of there was sa much protection from wells that they did not seed any hody on rehef works?—I think so.
- 73. Q. Could you give us any idea at all of what proportion of the cultivable, area was irrigated by wells in these villages roughly?—I chould not thick more than one-tenth.
  - 74. Q. Not more than that !- No.
- 7āQ. . So for os your experience goes if n village has that proportion of its area irrigated by wells it would have sufficient protection against famino?—Yes; but I could not be quito ours.

- 76. Q. If a village had a quarter of its area irrigated by wells you would regard it as safe?—Yes, certainly.
- 77. Q. Would you be icalined to put it at occ-eighth?
  -Yes.
- 78. Q. Speaking of those other Gavorument works on which a cansolidated rats is paid, are thora any large works among them—I mean works under which 2 or 3 villages irrigated ?—I think under the Mandopor two villages are irrigated.
  - 70. Q. Do they manage their owo distribution ?-Yes.
- 80. Q. We were told that people cannot combine in these parts so as to orrange their owe distribution?—I think they can.
  - 81. Q. Your experience leads you to think so?-Yes.
- 82. Q. What has been the history of your wells deriog these past 2 years? You had famina in 1806-97 and then 1 heliore, you had a year of good rain full?—Yee, hut, I bellsve, that some of the villages have not had raie for 5 years.
- 83. Q. In 1899 whoo the second famine came, how did the wells should Hed they had a fell sopply ?—I think so.
- 84. Q Since then, I suppose, they bave more or less failed?—Yes.
- Sa. Q. When did they begin to fail?-About Jonuary 1900.
- 86. Q. As early as that?—Yes; we began to feel the pinch for water from January 1900.
- 87. Q. From that time things became werse?—Yes,, 88. Q. What propartion of their normal eros, do you soppose, the wells could water new?—I should thick obout one-half.
  - 80. Q. Not more than half?-No.
- 90. Q. The locrease in area of lands irrigated was due to well-, which were partly discosed, being brought into use again?—Yes; I think so.
- 91. Q. As regards taken you recommend that, when water is not found owing to causes which are not under the control of man, the muncy should be remitted?—Yes,
- 92. Q. Would that be advisable; would it not give an opening for fraud? We have been told by witcess after witness that it would be inadvisable in Bombay; a man would take its, 500 to make a well and opend only its, 200 on it, applying tha rest to his own use and then say "I cannot find water and I must ha let off." What do you think?—I den't believe that to be possible as long as we have supervision. If we have an establishment to supervise these works I don't see haw that could be the case. Yno can see if he has dug n hole and you can find ant how anneh it has cost.
- 93. Q. Do you think that the sepervision at present available would be sofficient?—It is a question how large your establishment is.
- 94. Q. In n year like the one you have lately experienced, opplications for takeri ore more enmerces than in ordinary years !—Yes.
- 95. Q. In soch o year hot not in an ordinary year you woold want an oxtro staff.—Yes.
- 96. Q. Where the sobordinate officers have to make reports as to the yield of crops or areas, or any matter in which Government and the aultivator or concerned, is it your experience that their tendency is to oversiate or understate the fact, to lean slightly thwords the Government side or the reverse?—I do not believe that the subardinate village officers lean to Govaroment,—probably the Ahamlatdur dags.
- 97. Q. The agency in their report would of ony rate not be likely to report that something more has been spont than has resily been tha case. Suppose a man has borrowed R-500 snd spent only Rs. 400, in their report what would the Manulatdars say—What is your experience?—The Manulatdars would be on the Government side.
- 98. Q. There would not be very much danger of Government losing maney to the way I have indicated;—No, I doe't think so.
- 99. Q. Have you any experience of boriog apparatus?
  -No, none ot ell.
- 100. Q. A cansiderable number of wells were made during the famine years of 1800-17, are most of them kackeka?—I could not tell the proportion but I have seen both kacheha and pakka.

- 101. Q. What is your impression? Are there as many kacheha as pakka?—The people generally got money and make them pakka.
  - 102. Q. Are there a good may kacheha wells?-Yee.
- · 103. Q. A great many.-Yes.
- 104. Q. Would it be worthwhile making efforts to get these made pakka?—Suppose you were to offer them additional takavi grants on easy terms, do you think that the people would be induced to make them pakka?—Yes; a good many have been made pakka.
- 105. Q. Do you think it would be a great inducement if you could tell the people that you would take no interest?

  —I don't think that would make very much difference. I den't think the people mind paying the interest.
- 106. Q. If you were prepared to advance money on ordinary terms do you think they would take it.—Yee, I think so.
- 107. Q. In regard to grants for welle have you over had complaints about the amount granted not being enough to make a well ?—Yes, I have.
- 108. Q. Is the insufficiency of the grant due to the fact that the land is perhaps hardly sufficient security?—I think it is partly due to that. Then the Mamlatdars, as they are responsible, are very cantions.
- 109. Q. Apart from that is it your experience that in many parts of India there is a feeling that takavi is a sort of dobt of honour which must be repaid?—No.
- 110. Q. You don't think that that is the feeling ?-I have nover heard of it.
- 111. Q. (Mr. Higham)—Is it regarded as a discreditable thing to take takavi?—Not at all.
- 112. Q. (Mr. Ibbetson)—You say "it seems to me that it is the hest soils that require the deepest wells" you are speaking from experience?—I think so; of course, I do not know very much of the question of digging wells in black soil. I think it is the most difficult soil to get a well in well in.
- 113. Q. It pays best when a well is deeper?-Yes, but in very many places you cannot get water.
- 114. Q. You are distinctly of opinion that there are a considerable number of wells that have been made that are etill efficient and are not used in good years in this district ? -Yes; 1 think so.
- 115. Q. (The President)—Are they not not used for want of cattle?—No; it was not worth the labour.
- 116. Q. (Mr. Rajaratna Malr.)—On the Muchkundi Tank the average area irrigated is 43 acres and assessment Rs. 344?—Yes.
- 117. Q. That gives an average about of Rs. 8 per aero ? Tes.
- 118. Q. Do not you think that a high rate considering the uncertainty of the water-supply?—Perhaps it is.
- 119. Q. (Mr. Muir-Mackenzie) The rale, I suppose, depends upon the crop?—Yes; I believe it is its. 8 ou some crops and its. 2 le its. 4 on others.
- 120. Q. (Mr. Rajaratna Mdtr.) From Mr. Lawrence's table it seems that the unaber of wells has increased from 3,787 in 1886.87 to 7,185 in 1890.97. Has there been a further increase since 1890.97 P—Yos; I think so.
- 121. Q. Could you give the approximate number new existing !—I am afraid I have not got figures with mc.
- 122. Q. In one of the memoranda submitted by a Mamlatder it is stated that the amount of takevi is generally fixed at 20 times the assessment. Is that a rule ?—There is no general rule laid down, but it is fixed on the amount we would pay if the laud was to be taken up.
- 123. Q. (The President)—De you use up all the money that Government allots for takavi?—Yes, we use up as much as we get and we generally ask for more.
- 124. Q. Would you get more if you asked for it?-think that, it depends u pou the Gevernment of Iudia.
- 125. Q. (Mr. Muir-Mackensie)—During the last famine was the Government of Judia very liberal !—Yes, as far as I know they were.
- 126. Q. (Mr. Rajaratna Malr.)—Have you any etatement showing the amount of takavi advanced in 1900-1601?-Yes.
- Mr. Muir-MacLonzie.-I think you will find it in Mr. Lawrence's hook.

- 127. Q. (Mr. Rajaratna Malr.)—Up to 1899 to 1900 five Mr. W. W. lakks of rapess were advanced for the con struction of wells.

  The figures for last year are not given ?—We advanced about 2 and 3 lakks, not altogether for wells.

  6 Jun. 02.
- 128. Q. Excluding last year, you advanced 5 lakhs of rupees during the previous ten years for wells alone?—Yes.
- 129. Q. Is the number constructed out of this known? -Yes, I can get the figure for you.
- 180. Q. Abent Rs. 50,000 were granted for other irrigation works. Is there anything known as to what these other irrigation works chiefly wers P—I suppose the making of small canals and hunds.
- 131. Q. Is any information available es to the number of wells not completed owing to the insufficiency of takavi advances ?—I cannot say; I shall ascertain if the figures are available.
- 182. Q. Would it not be advisable to give enough money to enable the people to complete the weils?—Ycs, I think it would be advisable.
- 133. Q. You sey "three lakks collected were due to the Revenue Code Amendment Bill "?—When the Land Revenue Bill was first introduced the people did not understand its object or its effects, and consequently during the first week or two after it first appeared in the papers the people rushed to pay. If they had known that rovenue had been suspended that would be a partied to pay. If they had known t pended they would have wnited.
  - 134. Q. They paid up the arrears?-Yes.
- 135. Q. (Mr. Muir-Mackenzie)—What proportion of the district do you think it would be necessary to thoroughly afforced in order to make that plan afford some approximal protection to the district f—I could not say.
- 135. Q. Do you think it would be one-third !- I could not say.
- 197. Q. About one-fifth !- Yes that would be more like
- 138. Q. Do you not think the scheme might be outside the rauge of practical polities P—Perhaps it might be.
- 139. Q. Do you think that the power to withstand drought would be increased by increasing the number of tale?—I don't think that tale are of much use in a bad year. They might increase the fodder crop.
- 140. Q. I thought I noticed that there was a difference on the line of milway in these fields which have bunds?—They might improve the fedder even in a bad year; but they would probably meke only a little difference in a grain
- 141. Q. De you coasider fourteen or fifteen years without famiac the normal period for this district?—No. It was
- 142. Q. On what grounds ?—From provious experience; I doo't think we over had 10 years without familie or without severe distress: 1890-1891 was a year of distress.
- 143. Q. In that year did Government collect all the land revenue?—I do not knew what they collected.
- 144. They did collect something. Do you remember how many people there were on relief in that year?—I cannot
- 145. Q. Assuming that Government collected most of the revenue in 1891 and 1892, I gather that after 1876 and up to 1901, Government lest about one year's land rovenne, in addition to the expenses incurred on famine relief P-Yes.
- 140. Q. Did the people reliaquish much laud?—No; because we suspended payment of assessment.
- 147. Q. Did you find people deserting the villages?—Yes. A great many went away, but most of them came back.
- 148. Q. The point of my question is, whether in 1877, a large number of people deserted and did not come back?—
  So I have heard.
  - 149. Q. And their lands were put into foreste?-Yes.
- 150. Q. What do you regard as about the cost of a well of average depth P-Between Rs. 500 and Rs. 1,000 for a pakka well.
- 161. Q. For an ordinary well !- Abent Rs. 600 to Re. 700.
- 152. Q. Would you be glad to see funinellabour omployed on hunds and tols?—I do not quite believe in the employment of famine labour on private persons' lands.

Mr. W. W.

- 158. Q. Do yan think that it wanld be difficult ?—I have not thought about it at all; I think it wanld be difficult to employ famine labour an private persons' lands. They could do the work cheaper themselves.
  - 154. Q. But, suppose they were not charged, and Gavernment did it far nathing?—Then there would be no abjection. Perhaps the people would be auspicians at first; but they would get recouciled. The question would be the arganization of loboor.
  - 155. Q Do you see any difficulty about organization f— Wo would have ta treat a whole villogs et a time, so as to decreose the cast of enpervision.
  - 156. Q. Do you think my insaperable diffisulty would arise P-No.
  - 157. Q. On the whole, you are in fovour of thet sahems? I would rather have it than making more reade.
  - 158. Q. Would you rather employ fomius lobour on tals thon an tanks?—No; I would rather employ it an tanks.
  - 159. Q. Was any praposal made ta employ famine labour mu these bunds?—No; not in this district. It was done in the Jath State but without ony great success. The present Administrator dase not boliave it; he thinke that the cost is out of all preportions to the profit.

- 160. Q. The last Administrator thought be might employ famine labour more esecomically within the State?—Yes.
- 161. Q. Resides the second class works are there any small irrigation works in your district P-Yes.
- 162. Q. Would yau like to see their number increased? —I don't thick that would do much good; I thick if mare money were sunk in wello it would be more profitable.
- 163. Q. If the existing tanks were improved or new tanks constructed do you think that the people wantd use the water?—I do not think they woold in ordinary years.
- 164. Q. On those worke on which they use water do you bink they use it economically?—I think so; I have not beard of any disputes or complaints.
- 165. Q. You have never heard complaints af the water being wasted?—No; I have not.

  166. Q. (Mr. Ibbetson)—Do you think that people are prevented from laying out money in irrigation works by the fear of increased assessment?—I don't think the people know that improvements cannot be taxed.
- 167. Q. One of your own Memlatars was not quite cure about it?—Yes; the people da not know, or well or thay ought to, that improvements on lands will not result in an increase of assessmoot at the next revision of settlement.

WITHESS No. 68 .- Mn. RAGHAYENDEA SHAMRAO BAITMANGALKAB, District Deputy Collector, Bijapur. Answers to printed questions.

Mr. Point No. 2.—The grass area of the Bijápur district in Baitmangal- acres for the year 1900-1901 is 8,628,789. kar. The oulturable area of the district is 3,227,208 acres.

Area irrigated in 19,428 acres. In 'round figures this comes to about 20,000 acres. 6 Jon. 02.

The different cources from which water-supply is secured ta thio area are as follows :-

		Acres.
(1) Government Irrigation works		1,440
(2) By private or village works		2,202
(3) By wolle	•	15,786

The proportion of area irrigated by Government works of the total culturable area is 1 to 160, i.e., '060 per cent; that of area irrigated by private or village works is '0889 per cent; that irrigated by wells is '49375 per cent.

The nature of the country is undulating and consists af varieties of the soil as shawn below:—

					ĸ.	a.	р.	
Totally red soil .	•	•	•		0	õ	4	
Totally black soil		•	•	•	0	5	4	
Mixture of black a	nd rec	soil	togeth	er.	0	5	4	

i.c., a third of the total area may be assigned to each of the three above-mentioned olasses.

The statistics relating to rainfall are as chawn below :-

						Inobes.	conte.	
1895	•		•	•	٠.	20	67	
1896		•				9	24	
1897				•		21	61

1901	_		_		_	16	4.4	

There is ardinarily a demand for water in the districte of Bijapar and Duarwar during the south-west moneson for the reason that the two tracts are not tatelly robi cropgrowing districts. In Bijapar the whole of Bádámi, more than three-fourths at Hungond and Bágalkot are tracts adapted for kharif juari. Portione of Muddebihal, Sindgi and the whole of Bágevádi, i.e., the portion going by the name of Don valley, may be seid to be not in need of water during the south-west is monsoon, as the soil thereof is more adapted for the growth of late crops, such as late juari, gram, wheat, etc., so well as cotton. The ather portions of the district ore suiled for the raising of kharif crops. It is for this reason that there exists a demand for water in the months of June, July and the carly part of August. In the asso of Dhurwar I must say that the whole of the district, except Navalgand and ports of Ron and Gadog There is ardinarily a demand for water in the districte of

excluding Mundargi, needs waler during the coultb-west monsoon. Early juari is the principal stople raised in this district in the non-mailed portions of Dharwar, Huhli and Bankapur. The whole of Hangal, Kalghatgi and Kad, where early rice is the principal staple grown, rain is essentially necessary during the sooth-west monsoon.

The following is a liet of the crops which require irriga-tion both in the districts of Bijapur and Dharwar, with the exception that ie the first-mentioned district cocca palm and enpari (betel-nuts) are not raised in its gordens, while in the malled gardens at the last-mentioned district that two above mallad gardens at the last-mentioned according garden crops are raised for the most part :-
Duration for obtaining

						Data	mal	ior ot urity.	ainig
	Onions	•	•		•		3 1	nont	hs
2.	Coriander :	seed		,		•	2	9)	
3.	Khopuli o	r joda	palm		•	•	4	,,	•
4.	Carrots	•		•		.7	4	<b>b</b> )	
	Sweet pota	toes			• •	٠.5	19	,,	
	Chillies				,	•	4	,,	
7.	Plantaino	•	•	•	•	.7	12	"	
8.	Sngarcano			,	,	. 5	10	"

11.	Brinjals at	ad otb	or ve	zetah	leo	•	2	**	
12	Rále .	•	•		•		3	22	

All these crops require ordinarily two waterings in a week in the district of Buapar. In the case of superior week in the district of Bijapin. In the case of superior soils which could retain moisture, one watering is said to be enough in a week. In this respect the cose of Dharwar differs to some extent fram that of Bijapor. In Dharwar, especially in the treet which lies to the west of the Poana-Harihar Road, some of the garden crops, such as onions, carrots, chillies oud meize, are roised during the south-west monsaon without irrigation.

Of these, onious, garlie, sweet potatoes, faddor jnári, brinjals, etc., nre sown in Bijápar, after Diváli, i c., in the cold wenther. The rest are sown in the commencement of Mriga Sál, i.o., early in June.

The distribution af water in the case of Government Irrigotion works is controlled by the officers and subordinates of the Irrigation Department both in the districts of Bijápur and Dhárwár. Distribution fram Government tanko in both the districts nod from wells which are for the most part private property does not need any control, for the reason that in the case of irrigation fram private wells the nrea irrigated is, as a rule, the property of an individual, and as such, does not need the necessity of control. In the case of tank-irrigation also the fact that a larger proportion of lands dependent an that kind of irrigation bas been assessed at consolidated rates has minimised the necessity of control in water distribution. The villagers amongst themselves choose a rayat and cutrust him with the doty of water distribution. He is called the "Nirmanegár." He is paid geaerally in kind by the royats holding lands nader the particular tank. It is this "Nirmanegár" wha distri-The distribution of water in the case of Government

botes water to the villags lands in the order of retation according to custom. The instances in which the rayats land to invoke the assistance of authorities by a soit in the Mambadar's Court under Act No. III of 1876 for the removed of obstruction caused to the flow of water for the irrigation of their lands were so few in the interval of cearly 15 years, during which I held the office of Mamlat in the districts of Bijapur, Dharwar and Kanora, that I am prepared to say that the existing arrangements call for no cause of interforence. Irrigation revenue is realized In the forms of distinct water rate and coosalidated assessment in the two districts. The first-montioned form of realization is only adopted in the cass of recent irrigation works as shown bolow :-

Bijápur Muebkundi tank. 1. Madag canal. 2. Dambal tank. Dharwar .. 3. Medleri tank.
4. Asundi tank.

In the case of all the other irrigation works consolidated ascessment is levied.

The extent to which coltivation is dependent on artificial irrigation bos already been stated above. On the whole the area so irrigated does not exceed '060 per cent. of the total lituroble area of the district of Bijapur. The statistics of Dharwai ore not available with me.

Point No. 1.—Ont of 17 Government irrigation works which stand registored in public occounts in Bijápur, 5 are streams or nales wherefrom water is made available for irrigation. The rest are tanks as shown in the accompanying Statement B. In the case of Dhárwár I am sorry I was unable to collect the necessary statistics, having had to sover my connection with the district just at the time when I was called upon to answer these queries for the information of the Irrigation Commission. However, I take this opportunity of placing at the disposal of the Honorable Commission such information as I possess on the subject. As a Sub-Divisional Officer in charge of the four southern As a Sub-Divisional Officer in charge of the four southern As a Sub-invisional Gueer in charge of the lour southern talukas of Dhárwar I had reason to see two canal works and a certain number of village tanks, all being Government irrigation work. The two canal works are (1) the Madag and (2) Dharma canols. The first-mentioned work is a diversion of the floods of the Kumadwati River which reasons in clarge lake called Madag tank. The tank proper rises in a large lake called Madag tank. The tank proper is situated in the limits of the Mysere Province. This is an enciont irrigation work, said to hove been constructed n fow hundred yoars ago by the former raiers of the land and appears to have been abandoned at the time of the introduction of the British rule. It has been restored to its former use nearly half a contury ago after the advent of British Power. Two canals have been constructed and they irrigate lands of about seven villages in the Kod Taluka. The other principal work goes by the name of Dharma canal. This is a diversion of the floods of the Dharma River in the Hangal Taluka. Water has been diverted into the canal at two different places by throwing stone embankments across the bed of the stream. These two diversions or eanals irrigate the rice and bagait hads of about 28 villages. All the other Government irrigation works foll within the category, of village tanks. Both the Dharma canal and the unsporting of tanks are ancient works and are now under the management of Dhurwar Irrigation Department. Except Modag tank or Madag canal all the other tank works proved a

failure in the year of scanty roinfall of 1899-1900. I cannot say that Dharma canal proved to be a total failure. In Baitmang it the years of avorage rainfoll the irrigators used to get three waterings, but in 1899-1900 many villages did not even get one watering. In many cases the outturn of crop raised by irrigation went down as low as two to three annas in the rupee. The capacities of Asundi and Melleri in Ranebennur Taluka have been recently increased by the Irrigation learnerings. Department.

Regarding the range of variation I have to add that there ore, under inightion in the case of each particular work alluded to above, the areas likely to fluctuate or vary according to the quantity of supply available in them. This again depends upon the rainfull of the year. In the year of ample fall the area under irrigation does not show a folling off, whereas in a year of seasity fall there happens to be a corresponding diminution in the area irrigated.

Point No. 6 .- By district or villoge works I understand Point No. 6.—By district or village works I understand that they are meant to designate the works constructed at the cost of District or Taluka Local Board funds for irrigation purposes. So far as I am aware, no such works do exist either to the district of Bijapur or in Dharwar. The resources of these local bodies are not, in my opinion, sufficient to undertake such works. In their present financial strain they cannot be expected to go beyond the objects provided for in Bombay Act No. I of 1884. In these circumstances I am not prepared to suggest the execution of soch works by the local bodies.

Point No. 7.—Total area irrigated by wells in ordinory years in Bijapur is about 10,000 acres. Number of new wells constructed during the last 10 years is about 2,700. Information is not available as to the number constructed annually. The accompanying statement, marked A, shows the extent to which taker advances have been made for the construction of wells in Bijfipur during the last 10 years. So far as I am aware, no concessions have been given to the constructors of new wells. In my opinion it is desirable to constructors of new weets. An my opinion to is desirable to stimulate the construction of new wells by more liberal advances. Owing to scanty rainfall in 1899-1900 the wells in the districts of Bijapur and Dharwar had run dry in almost every case in the following year. In cases in which betel vine irrigation solely depended upon well-supply the owners of the gardens had to deepen the surface or olear silt and to the rule of their errors supplied. In the case of the surface or olear silt and their proper supplied. in order to make their crops survive. In the case of wells in gardees, which depended upon tank-supply, the wells had miscrably run dry, and the superi crop had to suffer serious damage in Dharwar. I had to notice this in Hangal parli-oularly. The people had to cut down a large number of supart trees and ose the dead wood in putting up their plague sheds. In the case of the wells which had the sub-soil drainage or percolation supply from tanks the average depth of water below surface was found to reach from 15 to 20 feet or thereabouts. In the case of other wells the depth was observed to reach from 30 to 50 feet. The cost of un average well for irrigation much depends upon the nature of soil to be excavated and the distance at which the water-bearing strata would reach. Generally wells dug beside the malas and rivers cost less than those dang in black soils. The cost of a well falling within the foreign class comes to about Rs. 200 to Rs. 250. In the case of other wells the outlay may be estimated to cost about Rs. 500 to Rs. 1,000. The oven served by an ordinary well may be estimated at about 15 acres or thereabouts.

#### II.

#### A.-GENTBAL.

The answers below refer to the districts of Bijápur and Dhárwár. As a Mámlatdar and a Sab-Divisional Officer I have hed a fair opportunity af becoming acquainted with these tracts.

2. The overage rainfall of Bijapur in an ordinary year of rainfall is as shown below:—

#### Bijapur (Taluka Bagalkot).

				I	nohes.	cents.	
1895					20	67	
1896	•				9	24	
1897					21	91	
1898		•	•	•	26	82	
1899	•	•	•		22	17	
1900	•	•	•	•	20	99	
1901					16	44	

I am sorry I caunot supply the information for the district of Dharwar as I was obliged to sever my connection with that district when I was required to answer to these queries owing to my transfer to Bijapur.

3. So far os I om oware, the under-mentioned ceuses may prove to be obstacles to the extension of irrigation in the above-mentioned tracts:—

(1) Pore black cotton soils of Navalgund and parts of Gadag and Ron in Dhármár.

(2) Parts of Hungund, Siodgi and Bagevadi in Bijapur with block cotten soil.

(3) Lack of capital for the initial expenditure, etc.

(4) Uncertainty of the supply of woter, etc.

With these exceptions, in the other portions of the two districts irrigation may possibly be extended if due provision for water be made. 4. So far as I can recollect, no orders appear to be in force which exempt land irrigated from works constructed by private capital from liability to the poyment of enhanced necessment for a certoin and epecified period. But in this connection I cannot refrain from quoting the liberal provisions made in the Bombay Land Revenue Cods, which prohibit the enhoncement of assessment accruing to the land from the improvements effected at the cost of private capital during the currency of a settlement, and I beg to take the opportunity of inviting the attention of the Honourable Commission to the orders of Government passed so for back as 1874 for the assessment of lend irrigable from wells constructed from private capitals. Therein the rate of fixing sessessment is restricted to the highest dry crop rate. That rate is Rs. 1-10-0 in Bagalkot, Rs. 1-8-0 in Badawi and Rs. 1-4-0 in Hongond and Rs. 1-2-0 in the rest of the talukas of the Bijapur District.

In Dharwar the maximum dry crop rate in some of the talukus of which I relinquished charge recently was Rs. 2-4-0 per acre, if I remember it rightly. I believe the rate in the neighbourhaod of Hubli and Dharwar must be far in excess of the above-mentioned rate.

far in excess of the above-mentioned rate.

So far as I nm awere, tennuts do not extend irrigation of their awar cost in the tracts alloded to above. The duty of moking extensions to irrigation generally devolves on the owner of the land. Tenants possess no proprietary title in the lend to be irrigated. Hence they do nut come forward to lay out their capital for the benefit of the landlard, who can, if he pleases, at any moment out them of their possescione. In my apinion the existing provisians are not quite sufficient to induce capitalist landlords to invest morn maney on irrigation in a tract where the assessment on dry crep lends is light nod where the nwner is sure to be profited by mising cotton and wheat crops without risk, expense and trouble in years of average rainfall.

5. The experience gained in the last few years has convinced me that the unlivetors of pure black cettan soil lands do not come forward to take tagai freely for the

sinking of welle. As has been observed above, the oultivators try to obtain as much tagái money as possible for the cradication of weeds and the construction of embankthe cradication of weede-and the construction of emback-ments, etc., to drain off flood water or to retain moieture. The existing rules as to the recovery of tagái leans une rather stringent and in my opinion deserve being made more clustic in practice. Unless Government are prepared to show to the borrower all the lenioney which a sewkar now shows to his debtor, I apprehend the tagái leans will not occume as popular as possible. When the question is considered in a financial pressure point of view I am of opinion that the plan will not prove workable. Of course the special concessions recommended in clauses I to 6 of the special concessions recommended in clauses I to 6 of this query may teed to the encouragement of tagai loane.

- 6. So far ae the two districts are concerned, extension of irrigation does not tend to jojure remaining coltivation. on prigntion does not tead to roture remaining contration. The staple crop is juari for the most part and the other valuable crop is cotton, which can be raised comparatively with less trouble and exponse than the irrigable crops; so the people would not take up irrigation to the detriment of the less troublesome cultivation.
- So far as the district of Bijapur and the non-mallad portion of Dharwar are concerned, people do not eviace any desire to extend irrigation to their lands for the abovemeationed reason.

For instance, the northern portion of Hirekerur and the conthero portion of Ranchesaur within a radius of 10 or 12 miles from Bysdgi would not willingly undertake irrigation instead of growing chillies as a dry crop; so the rayat holding black soil lands in the non-mallad portions of the Dharwar District and in the district of Bijapur would not prefer to resort to irrigation instead of raising early and late juari, wheat, gram, cotton, otc.

### C .- CANALS OF INTERMITTENT FLOW.

12. I' have not had any experience of caual irrigation in the Bijápur District. In the district of Dharwar I had come across the Dharwa and Madag cauals. Dharma canal is supplied with water during the raine by the floods of the Dharma River, while that of Madag is supplied with water of Kumadwati River. Two bands have been constructed to the Dharma River at two different places in two separate villages. The water of the main etream is diverted to the caual proper by throwing embankments across the rivers. Outlets built of etone musenry are constructed at reasonable intervals and the water is made to flow from the hod of the canal to the outlots through pipes or conduits and thence it is distributed to the fields by means of pats or channels. During the interval I had charge of the conthere cub division of Dharwar I did not receive any complaint from the villagers Dharwar I did not receive any complaint from the villagers who depended upon the Madag canal regarding the inude-quacy of supply. In the year 1899-1900, which proved most unfavourable even to the mullad tracts, the supply in the Madag canal did not fail, and the distribution was carefully controlled and regulated by the officers of the Irrigation Department, and the helders of lands which depended upon bopartment, and the dieders of raising where the area water for irrigation had the good lues of raising two crops. It was quite the reverse in the case of Dharan canal. The bed of this canal ordinarily gets dry at the end of January or thereabouts. In 1899 and 1903 the canal bed rau dry or thereabouts. In 1899 and 1903 the canal bed rail dry as early as October when waterings were necessary for etnoding rice. There were conetant complainte from the villagors who depended upon this capply that the distribution was unequal and that underhand dealings were also attributed to the subordinates of the Irrigation Department on whom the responsibility of distribution lay. In the case of this canal as second crop is raised by irrigation except pulses arised in rice lands at becoment to the autiliar of rice while eansi so second erop is raised by irrigation except pulses raised in rice lands subsequent to the outling of rice while no watering is necessary. In the onso of Madag it is supposed that a perennial supply is maintained in the year of ample rainfall. Is that of Dharma the cupply does not last beyond the menth of Jannary, i.e., till the close of the kharif harvest. In the year of scanty rainfall the experience of 1899-1900 proved that the canal had ran dry as early as Octubes when the kharif including raddy waterly as Ortuber, when the kharif, including paddy, wanted water very badly. I have not had an opportunity of trying these two canals in a year of drought. It is for this reason that I have obsseed Madag canal under class 'C' of intermittent flow and not under class 'B' of continuous flow.

14. So far as the rice grown in the mallad tracts of Dharwar is concerned; too late a commencement and too early a cessation of the copply are considered to he prejndicial to the growth of the crop. It is a general idea that howseever a good supply of water were maintained in a cunal, still rice crop is not supposed to yield a bumper outturn unless the paddy when in care does not benefit itself

by the late rains of October—what are locally tormed the Mr. falls of Uttara and Hasta Nakshatras. Hence it is necessary Baitmangalthat rice should he sown as early as it would admit of being in ears in September to Ootoher. Any ceesation of late rains is sure to bring about a failure of crops. The harvest of 1889-1900 of Hangal and Kod talekas is a clear evidence of my above assertion. I have not had the opportunity of observing the effects of too late a commencement of irriga-

15. I have not as yot come across any canal irrigation which was sopplousented by irrigation from wells given to the same land. I cannot therefore satisfactorily answer the same laod. this question.

#### D.-TARES.

- 23. (1) The tanks in the villages' traversed by the Dharma canal receive their supply from the canal. Other tanks is Hangal and Kod tanks receive their supplies from monsoon floods which drain the neighbouring aplands. The Bijapur tanks receive their supply from monsoon floods.
- (2) Water is distributed to the land by means of sloices or outlets constructed at convenient centres in the dam through pipes or masoury channels, water eventually reaching the irrigable lands by pats or channels.
- (3) The samply is ordinarily maintained throughout the year, i.e., till it is replenished by the storm or measons should of the following year in a year of ample rainfall so as incode of the following year in a year of ample rainfalt so as to suffice for the irrigation of segarcane, cocca palm, betol vine and supari palms. In a year of seasily rainfall the supply heally meets the requirements for the growth of paddy. In the majority of cases the beds run, dry in a year of scanty minfall. Then it is out of question to expect that they chould retain their sapply is a year of drought. The tank of Hirekerur is a typical icetance of tanks having run dry in the years 1804—1901. In these ways are the tank bads were given out for the maising of two years the tank bods were given out for the raising of autumu crops inasmuch as they had run dry.
- (4) The area irrigated from a tank depende upon its capacity to hold water. A line has been drawn by the Dharwar Irrigation Department by which it has under-Dharwar Irrigation Department by which it has under-token the management of tanks which irrigate an area over and above 50 acres. The management of tanks irrigating less than the above standard is left to the owners of lands benefited by them. As for the areas irrigable by the Bijapur tanks, particulars will be found in the accompany-ing statement. ing statement.
- 24. So far as the tanks of Dharwar are concerned, the aupply available therein is not utilized in cultivating two harvests even in years of ample rainfall. I think this must harvests even in years of ample raiafall. I think this must be due to the apprehension that the supply would prove insufficient for the perennial crops such as sugareane, botel viaes, eccea palm, sapari, etc., which require watering throughout the year and which depend upon the tank sapply. Ordinarily after rice cutting fields which are capable of retnining moisture are sown with the second crop of pulses, such so gram, mog and udid. These crops do not require watering. They grow by the sub-sell moisture and that hrought on by the dews of cold weather. In years of ecenty raiofall such as that of 1899-1900 and 1900-1901, the value of the produce of land under irrigation did certhe value of the produce of land under irrigation did eer-tainly increase, but I think it was due more to the prevailing high prices rather than to the fact of irrigation. When ang aigh prices rather than to the rues of irrigation. When the supply is available all round the year valuable crops, such as plantains, sugarcanc, cocoa and supari, are raised. In years of scauly fall these crops enfier.

In the case of irrigable crops years of scanty rainfall bring about more profit, dae to the limited sumply fetching high prices.

- 25. The roply given to question No. 14 holds good to this query.
- 26. So far as I am aware, tank irrigation ordinarily neede 26. So far as I am aware, tank irrigation ordinarily needs being supplemented by irrigation from wells given to the same land. This is especially necessary in the exce of sugarcane, hetel vine, ctc., during the hot weather menths when the supply available in the tank begins to run chort. This is only possible in a year of ample rainfall. In a year of seanty rainfall when the tank bede had run dry the crop raised therein land to saffer to a material extent. I have land to charge and damning done to the apparatuse and sense: to observe such damage done to the engarcane and supari crops in the villages of Hangal and Hattimattue in the Dharwar District in the year 1899-1900. Generally the supply in the Dhárwár irrigation wells which are sunk in the gardens commanded by irrigation tanks is co-existent with the tank supply.

kar. 6 Jan. 02. Mr. Heace in a year of scanty rainfall or in that of drought Bailmangal- the wells cannot be depended upon the supply irrigation to the garden crops.

6 Jan. 02.

28. In the northern portion of Bijapur Dietrick the 28. In the northern portion of Bijapur Dietrict the rect neually paid by the cultivators to the owner of the lond is a fourth part of the produce. The liability of paying lead revenue devslves an the awner. Na private canals do exist in the two above-mentioned districts; hence no payment has to be made on this eccount in these districts. Generally the rats of rent for irrigated lands is less than that prevailing for dry exop land. The reason for this is obvious. Irrigation, in whatever form it is practised, is more expensive than the raising of non-irrigabloomaps. The only axception to this rule, so far as I have abserved, is in the case af mullad gardees, where valanthe crops, such as anpari, betal vine and come are rented. In these cases, though the initial east is henvy, their np-keep is not said to cost much. In these cases the rent moy go up to one-holf of the annual produce, the liability to payment af land revenue devolving always apan the owner.

In the case of irrigated lands in the Bijapur District

In the case of irrigated lands in the Bijapur District the maximum rate is as follows :-

Tálukas,					Rice rate. Rs.	Garden rat Rs.
Sindgi		•			. 4	5
Indi					. 4	5
Bijápar	٠		•		. 8	8
Bagevadi	•		•	•	. 4	8
Muddehih	ál	•	•	•	. 4	5
Bágalkot	•	•	•	•	. 8	***
Hungand	4	•	•	•	. 8	8 8
Bádásoi	•	•	•	•	. 8	8

29. The newer to this queetion mach depends apon the distance from which water is to be taken. Exponditure necessory to bring water to the field is not a heavy item on the occupant. For preparing the land for irrigation a sum of Rs. 12 to Rs. 15 is said to be necessary; ploughing Re. 5 per sero; levelling Rs. 5; manuring Rs. 2 to Rs. 5; miscellargeon vil. miscellaneone, nil.

miscellaneoae, nil.

This is generally incurred by the tonant. The tenant recomps this expenditure by allowing the landlord as emaller share of the produce. Three-fourths of the outurn by way of compensation, etc., go to the tenant. In the northern portion of Bijapur capply of manner does not prove to be an item of heavy expenditure, insamach as the rayst is said to be capable af getting a cupply without payment. This is said to be doe to a large supply available without proportionate demand. In this part of the country monure is not given to ary crop lands as is the case in the three conthern talakas of Bijapur and throughout the district of Dharwar. Hence manare can be had in the narthera portion of Bijapur without much expense.

30. In the case of Government tanks irrigating mere

30. In the case of Government tanks irrigating more than 50 neres in each case minur repairs, such as the clearance of water channels and the filling in of cart rats caused to the dams due to cart troffic and the like, are supposed to be executed by the owners of lands benefited by tank arrigation. Practically these repairs are not proctually executed by the parties concerned.

The work is generally got done by the use af pressure brought to bear upon them through the egency af village and taluku afficials. The average cost does not exceed more than manas eight an noro in the ordinary cases of reputs. ann mans eight an norm in the ordinary cases of reputra-I do not remember af any instance of tatal neglect or refusal on the part of irrigators to excente these ropairs which by custom and asage they are required to do. For these reasons I do not advocate the necessity of any legislation is this direction.

31. There are no tanks constructed by private persons either to Bijapur or Dhawar. As stated in paragraph obove, the management of tonks irrigating an orea less than 50 mere vests in the villagers. It is supposed that thoy should excente the necessary repairs at their own cost, but practically repairs are not exemted and the beds become gradually silted. Urgent repairs to antite aud chaonels are executed by the villagers.

The lands under Dharwar and Bijapur irrigation tracts have as o rale been assessed at consolidated rates. Hence no difficulty prices in the realization of revenue. In case of dispute as to the use or rotation of flow of water to the fields, the existing law, Act No. III of 1876, provide amplo rousedy for getting immediate reduces. No further legislation is necessary in this connection.

32. Construction of further tsuks by private persons is not feasible either in Bijapur or in Dharwar Districts. I do not think it advisable to take any action in this

direction. As a rule all cultorable lands have niready been taken up by ravuts. Construction of a new tank will ent ill fresh acquisition which will not prove to he an easy job to the rayat.

#### E.-WELLS.

34. (1) The average depth of permanent wells in the Bijápur and southern tálnkus of Dhárwár comes to from 30 to 50 feet. In the case of wells sank in gardens which depend upon tank irrigation the average depth is not us low as those which do not depend upon that source. The depth of the wells fallion within the last-mentioced entegory ie from 10 to 20 feet from the surface,

(2) The majority of the wells in the two dietricte derive their sapply from springs. Supply from percolation is mostly confined to wells sonk on the banks of nalas, the percentage of which does not exceed 12 per cent. The supply generally fails in the hot weather, in years of sauty rainfall and in years of drought. In the years of average fall the sapply does not diminish.

(3) The cost of construction varies necording to the class of lend wherein excavation has to be made and the depth at which water-bearing etrata can be reached.

In the localities where the circumstances are favourable the cost at sinking no nverage well with masonry wall on one side together with a masonry platform and the provision of pulleys comes to about Rs. 500. If mayonry walls have to be bailt on all the four sides the cost woold preportienatoly increase to Rs. 1,000 to Rs. 2,000 according to the kind af stoor used If dressed stones ara made nee of, then the item of expenditure will increase. The wages of a stone mason in on ordinary year comes to about eight nanas a day.

- (4) A pakka well of the above-mentioned description needs no repairs. Only it needs silt clearance once in 15 years ar thereabouts.
- (5) Lift is the only mode in which water is generally drawn up for the parpose of irrigation.
- (6) The avorage area attached to and commanded by a well may not exceed 5 to 10 seres at the most.
- (7) No portion of the area cacable af being irrigated by a well is allow avoidable causes. well is allowed to lia waste in a year axcept for un-
- 35. It is no undispated fact that two harvests instead of one can be made on laads irrigable by a well, and the val of crop raised thereon must turn out in be double of what could be raised from it by the sowing of klarif crop.

The general iden is that the soil is not adapted for the growth af valuable gardes crops such as supari and occapalm, ele, in Bijápor and non-mallad portions of Dhárwar. Cultivation of vegetables does not add maca to the increased value of the produce of the land.

Sugarcane may add to the increased value of the produce, but ite cultivation is not extensively resorted to for the apparent reason that a valuable error sach as an excite cetten can be raised with comparatively little ontlay and less trouble as well as to the fact of apprehension that the supply of water would prove insufficient during het

Ghur is not ordinarily manafestared from sugarcane in Bijápar and the non-malled portions of Dhárwár. It is generally used for consamption in the form of juice extraoted from cane in its raw form. The same reason holds good for the valuable crop af betel vice, the cultivation af which is not much resorted to in the sardons of Bijápar and those of the non-malled tracts of Dhárwár. The unity instance of exception to this rula in the Bijápar District which I remember is that of Tolosbgod gardens wherein betel vine is raised

88. So far us I am aware, serious difficulties are likely to be encountered with in some cases in which well-sinking no oe enconnector with in some cases in which well-shiking prajects are intended to be taken up, though I am not prepared to say that they happen in almost every case of well construction. From the experience gained in this direction as a Vice-President and President of the Local Bestds, I am of opinion that some assistance by way of expert edelse ia desirable in this connection in order to obviate the loss that desirable in this connection in order to obviate the loss that woold atberwise happen in the horrower and the waste at public money lent by Government. Some instances of failure at well projects have been brought to light which were solely due to want of expert advice in the selection of sites for well-sinking. I do not mean by this that the necessary ngeacy is totally wanting in the district. Quacks are found everywhere whom the callivators ordinarily consult. In some ceses even astrologers too are concented.

As a rule the stock available is from uneducated closs, and as such, the advice given by them does not turn out as useful as that emanating from educated agonor, hence the necessity of expert advice which is of some material value.

In the construction I have not hed the experience of royats having encountered with difficulties. I om not aware of any instance in which assistance has been given either by of any instance in which assistance has been given either or Government or by the local budies in the construction of wells in the shape of expert advice, etc., The best practicable way for attaining this object would be to utilize the services of excessers and sub-oversoors attoched to the Local Boards in the irspection of sites before the commencement of sinking and excuration work; eccoudly, to relieve the horrower of his liability to pay for the cost of basing in all cases, in which the proposes have resulted in boring in all oases in which the projects have resulted in failures; thirdly, to increase the number of instalments of repayment of loans grauted for well-sinking; and foorthly, Baitmangalto reduces the rate of interest to 3½ per cent. or so. By
these concessions, I think an impetus would be given to more well-construction businsos.

6 Jnn. 02.

ĂΓr.

- 39. The proposal is not likely to meet with the approval of the general body of rayats, on the ground that cost to he incurred by the Government ogency would be enormous as compared with that executed by the rayat himself. Favourable concessions, such as remission of interest and the increase in the number of instalments of ropayment, may stimulate the borrowers to consent to Government constructing wells in their private property.
- 40. I do not recommend the introduction of temporary wells in the tracts to which the above remarks refer.
- 1. Q. (The President.)-You are District Deputy Collector of Bijapur!-Yes.
- 2. Q. How long have you held that post ?—In this district only 2 months.
- 3. Q. Refore that where were you?-I was in Dharwer.
- . 4. Q. How long ?-Neorly 2 years.
- 5. Q. Where did you get your previous experience?—
  I was Mamlatdor in this district for 4 years (1885 to 1888), having previously been Awal Kurkun. Then I was Momlatdar in the Konara District for 3 years, thereafter Mamlatdar and District Deputy Collector for about 10 years in the Dharnar District. I came back to Bijapor in November last.
- 6. Q. You say in parograph 5, "experience gained in the last few years has convinced me that the cultivators of mre black cotton soil lands do not come farward to take takeri freely for the sinking of wells."—Wells are not popular in the pure black cotton soil?-No; that is my experience.
  - 7. Q. That Is, in about one-third of the district !- Tes.
- S. Q. Is it the same proportion in Dharwar ?-Yes, except in the mulind tracts where red soil predominates,
- 9. Q. What would you recommend for the protection of those parts of the district which are not favourable for irrigation and are of black cotton soil?—I think canal irrigation would be the best thing; they can raise sugarcane in black cotton soil from canal water and also from wells.
- 10. Q. Not from wells?-No; there is some difficulty about the depth of the water in wells.
- 11. Q. We have evidence in this district from other people that in ordinary years they do not irrigate black cotion soil?—No; they raise cotton and other crops and get a moderate profit out of them; that is my experience.
- 12. Q. Do you approve of smoll village tanks. Do you think they are really useful to the country?—Yes, in the mailed or hully tracts and not in black soil tracts where these shall tanks will not prove useful for the raising of dry crops.
- 13. Q. (3fr. Ibbetson!-Did yan sny small tanks; could they be made useful?-I meaut small wells.
  - 14. Q. Kachcha wolls?-Yes.
- 15. Q. ('the President')—There are not very many wells in this district P.—There are some places in this district in which the depth of a well from the surface goes down more than 100 or 130 feet. There are villages which have come under my observation in which the Public Works Department have abandoned well-sinking.
- 16. Q. Why? Because after sinking shafts over 100 feet no water has been rouched.
- 17. Q. What kind of wells?—Wells for drinking water supply. Well-siaking is not possible throughout the district. On the banks of nalos and rivers it is possible,
- 18. Q. I gather in Dhurwar there are many small traks on the western side of the district ?-Yos.
- 19. Q. The country here is like the eastern part of Dhárwar ?- Yes.
- 20. Q. Are there many tanks in the cast part of Dharwar?-So far as I know, there is only one big irrigation tank.
- 21. Q. No small village tanks?-Yes, there are zome in the Obarwar District but none in Bijapur.

- 22. Q. With your experience of this district what do you think would be the best thing for Government to do to help people so that they should not suffer if another famine occurred?—I would recommend the sinking of wells—pakka and kachcha—in places where water could be got near the natas and causa irrigotion by the bunding up of the rivers Ghatpmbha, etc.
- 23. Q. But there are a great number of places where there are no nalas ?—It is possible to bund the river, and make canals that would give some protection.
- 24. Q. Are there no causls ?-There are none in Bijapur. There are 2 in Dharwar-one is called Madag canal and the other Dharma canol.
- 25. Q. That has not done much good?-I cannot say that the carells have done no good. On the contrary, they have been beneficial in saving the traces, through which they traverse, from failure of crops to some extent. The only execution to this was the year 1899-1900.
- 26 Q. What do you think would be the best thing for the future?—Beyond sinking wells in involvable tracts and the construction of causle, no other remedy suggests itself to me.
- 27. Q. You say, "in my opinion it is desirable to stimulate the construction of new wells by more liberal advances"?—How would you do that; would you give smaller instalments or give up the interest?—I think the rules must be made more clastic and sympathetic in regard to recovering the advances. The conditions of repayment
- 28. Q What are the strict conditions of repayment which you would like to see removed P—The sowker generally lends money without any particular period of recovery. If Government were not to recover the instalments on the date on which they become due and give extensions of time that would be an inducement to well-sinkers.
- 20. Q. How many years do you give for repayment?—Generally ten; from five to ten.
- SD. Q. Why don't you allow more time?-That is the general practice.
- 31. Q. What is the Government term ?- Twenty years is the maximum.
- 32. Q. Why don't the District Officers give twenty years when that is allowed by law? - In practice we do not give the twenty years' time.
- S3. Q. Is there my concession which you think might be made?—In the case of well-sinking in some cover the people do not succeed on account of depth to which they have to go; in these cases if Government remitted the adsacre it would be a greet inducament.
- 31. Q. Don't you think that the cultivator might take advantage of that. He might spend the money on a different thing and then come and say "I tried but I can get no water"?—Such inclances may have economic, but are so few that they may be left out of consideration.
- 33. Q. You don't think it is vory common?—No; we have to guard against thom by frequent inspection of
- 36. Q. Do you find it difficult to recorer advances of taker? P-No; so far as my experience goes there is no diffionlty.
- 37. Q. Ther pay ?-Yes; an them au extension occasionally. and are very glad, if you give
- 38. Q. Havo you given thom extensions semetimes !-I have in some cases; not exactly in well-sinking but on goceral lorns.

- Mr. 39. Q. Do you think the rote of interest enght to be Bailmangal- lowered?—People don't care so much about interest because the present rate is low as compared with what the sowker charges.
- 6 Jnp. 02.
- 40. Q.—What does the sowker charge?—About 18 per cent. to 24 per cent. per aonnm.
- 41. Q. As much as 24 por cent ?-Yes; our rate is eo moderate that it is no use lowering it.
- 42. Q. Do you think if Gorernmout wore to say to the cultivator "We will pay you Rs. 500 to dig o well; we will not ask it back; only you must pay wet rotes for the future hy a stated periodical assessment changing every 30 years" would the onlivator take advantage of that nod build many wells ?—It will prove a very good inducement. The cultivator would pay a water rate if the iotial cost of einking a well is not charged to him. This concession will not be much availed of by rayate incomment. concession will not be much availed of by rayate inosmuch as irrigation by wells is attended with much expense and tronblo.
- 43. Q. You say the construction of tanks by private persons is not feasible.—No.
- 41. Q. Why not?—It is a speculation; so far as this district is concerved. The ramfall is precarious and there is no water. It depends entirely upon the facilities of getting noter; the chief thing is the certainty of finding water; if a man is assured that even in years of drought the supply would last one or two years then of course the Inamdars would run the huzard.
- 45. Q Are there many Innuidars in these places?-Not many enterprising Inaudars.
- 46. Q. When a cultivator takes a factor odvance and mokes a well, does ho expect to be charged the tret rate?

  —In the case of a new well, Government does not charge any extra rate.
- 47. Q. Does he know that?-Yos; because he only pays assessment on the land. Our rule is that we charge only the highest jarayat rate for well sunk from private capi-
- 48. Q. (Arr. Ibbelson)—You say in your note that there is no enhanced assessment during the currency of the present settlement?—Yes.
- 49. Q. What will happen at the next revision of settle-tent?—In the last revision there was a rule that in cases where well- are made from private capital the rate should not be enhanced.
- 60. Q. Do the people know that?—I think they know it; there may be some who do not know it; but in most instances the people do know it.
- 51. Q. If you know it is a permanent remission why do you nee the word, "doring the currenty of the present settlement"?—I have and that the sculement which we make is for a period of 30 years. That I think led mo to write the clause.
- 52 Q. You now know that no enhancement would be made after the currency of the present settlement?-Yes.
- 53. Q. Yet you put in these words?-Yes.
- 51. Q. (Mr. Higham)-Supposing there were a large 61. Q. (Mr. Higham)—Supposing there were a large irrigation work in bijspur with a constant unpply of water, what erop would the people irrigate? Would they grow sugarcame?—Yes; now people grow sugarcame from both well and canal irrigation. The fart is that the people of this district are not accurtomed to the irrigation of crops hat in the coarse of years when they become gradually according to it. I think they will grow sugarcame, plantains, cercals, and just in yirrigation.
- 55. Q. Would that take a great many years?-A good many years; hecause nuless to it. they become accastomed to
- 50, Q. Is the soil adapted for high class crops?—Yes; if a sufficient quantity of monure is used.
- 57. Q. How long does a well last?-It depends upon the structure; if it is well built with stone, it may last for a century or eo.
- 58. Q. You say in Dharwar tank irrigates more than 50 oerce?-Yes.
- 59. Q. Who are these entirely managed by ?-By the Irrigation Department.
- 60. Q. By whom are the larger tonks managed?-By the Irrightian Department.
- 61. Q. When a man wants to irrigate from one of the larger tanks does be have to said in an application?—There are some tanks which mit directly under the Irrigation

- Department for which they charge a water rate; in that case the people have to make applications for permission and pay the water rate which is charged according to the scale. There are many other tanks for cultivation on which a consolidated rate is charged. They don't charge a special water rate in such cases and no application is necessary.
- 62. Q. Not even when the tank is a large one?-It does not matter bow largs the tack is.
- 63. Q. Sopposing there are 2 or 3 villages irrigating from that tank don't they have to apply for water?—Woter is given in rotation; there are agents appointed who give it is turns and control the distribution.
- 64. Q. Are these agents appointed by the Irrigation Department ?-Yes.
- 65. Q. (The President)—You madegars "-Yes. mean the
- 66. Q. How can they work unless they have applica-tions. How are they to control the distribution?—My romarks apply to the tonks which are fed by the Dharma Canal. Mony tanks are fed by that canal. It is only in the case of these tacks that the Irrigation Department loterfere and control the water distribution.
- 67. Q. That is in Dharwar ?-Yes. In the case of village tanks the Patels and Airmanegars manage them; the area heing limited no difficulty arises.
- 63 Q. Do you think the 50 acres' limit might be iccreased; could a tank irrigating more than 50 acres be transferred to the monagement of the people themselves?—
  I think not; that would not work wall.
- 69. Q. Do you think it better that the lanks should be unter Gererment management than under the manage-ment of the people?—Yes.
- 70. Q. Even if they irrigate less than 50 neres?—Yes; that would do much better.
- 71. Q. In the case of certain tanks for which a water rato is realized if arrangements were made that the rillagers should poy something like an average for the last few years a fixed sum would they irrigate more freely?—That system would not in my opinion work well.
  - 73. Q. They would not irrigate a larger area?-No.
- 73. Q. Take the Muchkundi tank which irrigates acros; on that they pay an average argument of Rs. 111. Supposing they were asked to pay Rs. 111 down and then to take as much water as they liked would they brigate more than they do at present?—Who is to distribute the water? If the distribution is left to themselves then complaints would follow. One man by his influence would get more vater and wather less. water and unother less.
- 71. Q. Supposing that Government officials distribute. it; you give them as mach water as they like without charging anything more than Rs. 111; would they then take water?—I am of opinion that disinclination on the part of water?—I am of opinion that disinclination on the part of navats to take water for irrigation from Machkundi tank is due more to the insufficiency of supply for perenniol irrigation than to any other cause. The people are not necessioned to raise mons-on or other non-perennial crops. They generally do not need water for their ordinary dry crops in years of average rainfall. Their idea is thot canal water should be taken only for raising sugarcane and plantain crops and the existing supply bardly meets the requirements of the rayats for perennal irrigation.

  75. C. Why should not the Niguraporars distribute it 2...
- 75. Q. Why should not the Nirmanegars distribate it?the Dharwor district.
- 76. Q. (Mr. Mair-Mackenzie) Why should you not employ Nirmane, are here? -I don't see any objection.
- 77. Q. Oo the Mochkanditank why should not they have Arrangement Audulumnations was known and they awo kirmanegars?—In the first place the people in this district are not accordanted to irrigation. It is new to them. If they are put in the way by the appointment of the Nirmanegars they may utilize their acrvices.
  - 78. Q. It may be tried as an experiment ?-Yes.
- 79. Q. (Mr. Rajaratna Mdt)-Do yon know anything about the Nilgunds tank in this district?-I know that it bus been obsudoued.
- 80. Q. Why was it abandoned?-Owing to the insanilary condition of the village; the people said molarin pre-vailed there, especially in cold weather, and the tank was filled.
  - 81. Q. There was waterlogging at that time ?- Yes.
- 82. Q. In Dharwar the number of tanks shows o decrease in 1891-92 as compared with the figures for 1886-87. Could you explain the reason of that?—Yes a large

number were in disrepair, they were more attended to in 1893-94 or thereabouts.

- 83. Q. In 1899-1900 the area irrigated by tanks declined from about 89,000 acres to less than 20,000 acres !-Yes; that was of course due to famine.
- 84. Q. Was any remission of assessment granted on this tank?—No; there was some suspension in that year so far as I can remember.
- 85. Q. There are Government canals in Dharwar?-There are two.
- 86. Q. The area under the Government causles was 6,000 eeres in 1892-93; and it has gradually declined year by year. Do you knew the reason of it?—I have not made inquiries about it.
- 87. Q. The average area irrigated per well is given as 77 for Dhirwar, whereas it rises up to 800 in Bijapur and to 270 acres in Belganin. Why is it so small in Dharwar?—Well irrigation is not reserted to there on an extensive scale. There is a good tank system in Dharwar; and the people mainly depend on the tanks. I think that is the only reason.
- 88. Q. Yoo say "the existence of tanks does not raise the spring level of wells "t—No, that is a mistake. My answer needs correction. The existence of tanks does raise the spring level of weils to a large extent. I have experience of this with regard to the wells in the gardens of Hungul town and Huttimatur village in Kurajgi taluka of Dharant.
- 89. Q. Have yoo any reason to think that the system of recording the area irrigated is defective and that the small average is due to that cause !- Yes ; it may be so to some extent.
- 90. Q. At the revision of settlement is there not a general enhancement of assessment on all lands?—Yes, generally, but it depends upon circumstances. I remember rome cases in which the assessment was lowered at the revision in the year 1880-87 in the Badami taluka.
- 91. Q. Do you know of any taluka in which the recessment was enhanced at the revision owing to the rise in prices?—Of course there are such; but there are also eases in which assoment is lowered.
- 92. Q. Where enhanced assessment is charged have you reason to believe that it has been more on land with wells than on land without wells ?—In the case of well irrigation "the assessment is, as a rule, restricted to the highest dry crop rate; beyond that there is no enhancement.

- 93. Q. The rayats understand that?—Yes.
  94. Q. You give a statement at tho end of your note showing the proportions for Irrigation and for land revenue? would you explain how it is arrived at?-One-lifth for land and four-lifthe for water.
  - 95. Q. You work it out according to that rate !- Yes.
- 96. Q. As regards the management of tanks, those ltrigating less than 50 acros were honded over to the rayats or to the Rovenue officers?—The rayats manage them and repair them.
- 97. Q. They are bound to provide for the repairs of these tanks?-Yes, that is understood.
- 98. Q. Is any abotement made in the assessment?-No.
- 99. Q. Not as compensation for earrying out the repairs !- No.
- 100. Q. (Mr. Muir-Mackenzie)—The whole of your experieoco has been chiefly in the Dharwar district? Yes.
- 101. Q. The Hangai and Kod (34) thukas suffered badly from famine?—In 1899 they suffered to some extont.
- 102. Q. In those two talukas there are many tanks? -Yes.
- 103. Q. Are there meny tanks in the other talakas ?-A few.
  - 104. Q. Small tanks ?-No, not many.
- 105. Q. Are there many tanks in Karaggi ?- Only a fr. 17.
- 106. Q. How do they lie-to the west of the railway ?-
- 107. Q. Generally speaking the tracis in which many of those small tanks are, did not suffer in the least from famine ?- Yer.

108. Q. Do you think the existence of these small tanks contributed materially to the protection of these Baitmangattreets?—I cannot sey so. But the existence of the tanks and the fact that the tracts in which they lie receive early reinfell, have meinly contributed to the protection of these rouncil, have mainly contributed to the protection or these areas. In these tracts heavy rainfall instead of doing good causes damege to the dry crops. The people in sems places sow their lands with rice as well as the dry crops, such as jouri, bajri or ragi. If the rainfall proves sufficient and seasonable throughout the season, they raise their rice crop and neglect the less valeable justi or bajri. If, on the other hand, the rainfall proves insufficient they reap their dry crop and forego the rice. The rainfall though iosufficient for rice, is always enough for dry crops. Hence the nombian for rice, is always enough for dry crops. Hence the peculiar situation of the country between mailed on one side and the maidan or plains on the other may be said to have contri-buted to the protection of these siens from famlue.

109. Q. De you think it can be said there has been less suffering in these tracts owing to the existence of these tanks  $\ell$ —Yes.

- 110. Q. Would you therefore be prepared to advocate the construction by Government of more of these small tanks in the eastern parts?—The castern part is generally well adapted for growing cotton and juari.
- 111. Q. The construction of tanks would not be saitablo ?-No, I think not.
- 112. Q. In the western parts is the soil edapted for rice ?-Yes.
  - 113. Q. The soil is different ?-Yes.
- 114. Q. (The President)—Those western talukas are Malnur ?—Yos.
- 115. Q. (Mr. Ibbetsen)-What does that mean ?- They are hilly.
- 116. Q. (The President,—They never suffered very much from famino?—Last time they did suffer, i.e., in 1899-00 in some extent.
- 117. Q. (Mr. Muir-Mackenzie)—Because there was a short rainfall ?—Yes.
- 118. Q. In the castern parts is the soil suitable for making tanks?—No. I think not as suitable as the westom paris.
- 110. Q. When a mynt constructs a well without getting any takari from Goronment does he generally go to the sowkar for money?—Yes. But only well-to-do rayats generally invest their ospital in the cutorprise.
- 120. Q. The latter seldom have to go to the sowker ?-Vory seldom.
- 121. Q. Do they ever go to the sowker?-Yes, they do semetimes.
- 122. Q. What sort of agreement does the sewkar make? Yes, they demand so much interest.
- 123. Q. In how many years has the money to be returned?—There are eases in which it is not returned; the debt goes on from father to son.
- 121. Q. He does not contract to pay it back in a fixed number of years ?—No, when they raise a crop they pay the sowkar and again raise a locu from him; it is a sort of runuing account.
- 125. Q. If a sort of running arrangement could be made with Covernment do you think they would be ready to barrow from Government ?-I think so.
- 126. Q. Supposing Government decided upon neaudoning the interest and allowing the rayet to pay back a portion of the capitel advanced only, when it is convonient, do you think that would be a great inducement !—Yes; it is my opinion that many raynts would come forward.
- 127. Q. Do you think that the result would be that the rayal would never pay back the capital to Government?

  -No, certainly not; they are not so nufaithful, many would pay; the percentage of non-payers would not be more than I per cent. or 2 per cent.
- 128. Q. If left to themselves how long do you think they would take to repay the loan?—In good years they would come forward voluntarily; it would only be in years of searcity or bad harvest they would fail to pay.
- 129. Q. On an average would they pay back within 20 years?-Uertainly.
- 130. Q. You linvo a great deal of black cotton soil in your district !- Yes.
  - 131. Q. Is it very deep?-Yes.

6 Jan. 02.

Mr. 132. Q. How far down is the muram?—Below 50 or 60 Bailmangal. feet.

kar. 133. Q. In Bijapne is the black cotton soll so deep?—

6 Jan. 02

- 134. Q. None of the parts of Dharwar in which you have served have block cotton soil so deep?—Approximately they have the same depth as Bijapar.
- 135. Q. Do you think there is anything in the soil that makes it badly suited for irrigation?—So far as well-irrigation is concerned it is expensive to go so desp.
- 136. Q. I want to know about the soil. Suppose canal water is given?—Even if canal water were given I don't think the myats would be prepared to avail themselves of the advantage on an extensive scals in the black cotton soil tracts for the following reasons:—
  - (1) In years of average rainfall the soil is more suitable for the raising of dry crops. The raising of dry crops is not attended with the trouble and exponse necessary for raising crops by irrigation; and the rate of assessment charged being low, the mast naturally is not inclined to take to irrigation.
  - (2) Another reason is the difficulty of getting sufficient manure for the entire area of lus holding.
  - (3) The third and the most important reason is that the rayate in the black soil tracts ere not accutomed to raise monsoon and other non-perennial crops by irrigation. Their general idea being that irrigation should be reserted to only for

rice and perennial crops such as sagarcase and plantaine. It is a question whether the canals would give sufficient sapply for perennial crops in years of short rainfall. The Dharma Canal in the Dharwar District failed to sapply water for the irrigation of rice in the lands commanded by that canal.

- 137. Q. The soil does not become olavey and cake?—If a sufficient quantity of manuro is put down and if the land is ullowed to lic fallow for sometime the salt efficeseace will not affect it.
  - 138. Q. Otherwise it would affect it ?-Yrs.
- 139. Q. Does not black soil erack?-Yes, black soil generally cracks.
- 140. Q. If it was irrigated, would not these cracks absorb a great deal of water?—It requires a heavy rainfall to fill up these eracks.
- 141. Q. Do you think that on account of the soil getting middy and clayey it would be difficult to work properly?

  —I think so.
- 142. Q. (Afr. Ibbetson).—In the case of a bania who lends money for wells, I suppose the rayat gives the bania a considerable portion of the erop each year?—He does.
- 143. Q. If he did not do that the bania would cease to advance money?—Generally the object of the sowkar is to get interest, it is with that view that they give edvances.
- 14L Q. I cappose if the rayat left off making payments of crops on his running account the sawker would take stops to recover his money?—Yes, he would.

WITNESS No. 69.—ME. KEISENANI BALLAL BRIDE, Mamlatdar of Bagalkot.

Answers to printed questions.

τ.

Mr. Bhide. 6 Jan. 02. Yes, they do; but new tanke for two or three years Question &c. 5.—Black after coastraction or until the cotton soil floor becomes coasolidated do not hold sufficient qoantity of water. Black soil dams could not be raised of more height than 10 to 12 feet except puddling. Stone-pitching is generally necessary up to the high-water mark insids the dams in order to stop clods of earth falling into the tank. The demand for water increases in the drought, but it also exists in ease of average rainfall. Of late years, far reasons unknown, the rainfall has become scauty and variable. It does not fall seasonably. In this tract it is quite enough for agricultural purposes if it mins 6 to 7 inches from June to August and an equal quantity from September to the end of November. In a year of se isomulo rainfall splendid harvests are reaped and after a good year a rayst coald lay by oven for the following year, paying the Government daes cavily, which are not high. The owners raiss owing to paacity of funds small dams in their black soils to hold the rain wotsr as far as possible, and if tanks are coastructed they would be reminerative.

A well with two (mots) water-lifts ordinarily irrigates
7. Wells.
Sacres of land, except in years of drought when only it irrigates half the above area. The rayats in this part would prefer tank irrigation to that of a well, as the cost of construction (lie, 540 to its. 1 000) and the hailing of water from the depth (50 feet) entail heavy expenditure. About 50 per cent, is paid generally by Government in the way of takavi for the construction of a well. A rayat speads the romaining sum out of his own pooket if he is a well-to-do man. In some eases it is noticed that a well has remained half finished for want of funds. The concession in this respect is that the assessment is not increased during the carrency of the present settlement. If a rayat digs to the depth agreed upon and fails to get water at that depth, Government should immodutely give him the sum required to complete his well on his personal or other secarity. The interest charged is not high and one could not get money at such a low rate of interest as 5 per cent, however solvent the security may be. At present the Collector allows ordinavily ten instalments of the lonus greated both for wells and dams. In order to stimulate well-irrigation the period of repayment may be extended to 20 in all coses of loaas, except where the rayat himself agrees to repay carlier. Owing to anceessive droughts most of the wells ran dry, and they were deepened by taking out cell. But as they did not supply sufficient quantity of water, two or three holes were bored at the bottom with loag iron crowbars until they reached the water strata in the sub-soil. The water tappod through these holes less that furnished for irrigation, and enabled a rayat with his family and

bullocks to pall through the drought without going to a relief work. To enable the prompt payment of tukuri separate establishment with proper supervising agency might be created. It should move from village to village inspecting old works and sxamining now projects and issoing obeques on the Tulaka sob-treasury for payment of the loans required.

8. Drainage works. No drainage works are required in this part of the country.

The only irrigation work in this telloka is a tank in the 10, Programmes of relief village of Muchkandi. Ordiworks.

narily it irrigates 110 acres of 12, Yaluo of works in land. The water rate for the

14. Yaluo of works in land. The water rate for the reducing claims for famine perennial crops is Rs. 8. A proreduction ject of constructing a tank at Kalaskop near Kaladgi is under consideration. No systematic programmes exist for irrigation works. Famine relief was regoired in all its forms in the villages solmerged by the Muchkaudi Tank owing to the tailure of water in the tank.

II. A.-General.

Question No. 1.—To the Bagalkot Taluka of the Bijúpur District. I have served both as Mamlatdar and District Deputy Collector during the past two years and a half in the Bijápur District.

No. 2.—The average minfall of this taloka is us shown below:—

Mon	hs.		Rain	ifall.	Month	ı.	Pair	fall.
			las.	cts.			 Ius,	ctz.
January		•	0	1	July		í	δ <b>4</b>
February			0	31	Angast		0	90
March			0	6	September		6	22
April .			1	73	October		2	77
May .	•		1	86	November		*10	85
Jone .	•		3	41	Decombsr	٠,		

No. 3.-Except Nos. 5 and 6 my replies to others are in the negative.

Mr

Bhide.

6 Jan. 02,

No. 5.—Yes; the loans are freely taken. For the construction of a well the sum advanced generally falls short of the requirement under the existing practice. I have seen many a well constructed ont of takavi half fanished owing to want of capital. It usually happens that an advance is made up to 20 times the assessment of the land offered as security; but it does not answer the purpose in question. Moreover, a myst can get more money on the security of his said land by going to a sowkar. I would therefore suggest that sufficient money required to sink a well may be advanced on the security of land taking into consideration its market value in a favourable scason. I would also suggest the remission of the money spent in case of the failure to obtain water and the extension of the period of repayments from 10 to 20 where necessary.

#### D.-Tanks.

No. 23,-(1)-By rain water.

(2)-By small water channels.

(3) (a) -Two years.

(b)-One year.

(c)-Four months.

E .- Wells.

No. SA .- (1)-Fifty feet.

(2)—There are very few springs in the sub-soil and water is generally obtained by percolation. The percolation supply runs short in a year of drought.

- (3)—Rs. 800 to 1,000.
- (4)-Fifty years.
- (5) -By water-lifts called mots.
- (6)-Eight acres.
- (7)-Eight acres.

No. 25.—Irrigation increases the value of the produce of the land by twofold by rendering it possible to cultivate two harrests instead of one. In a year of ample rainfall the yield would be double, and in a year of scanty minfall it will be what it would have yielded in a year of average rainfall without irrigation, and in a year of drought one-fifth of the ordinary year.

No. 36-(1)-Its. 50 per acre.

(2) - Rs. 10 per aere.

No. 37 .- (1)-Rs. 25 per nere.

(2)-Nil.

These rates are paid on the total area attached to a well.

No. 38.—(1 and 2)—No difficulty is encountered either in the selection of sites for wells or in their construction.

No. 39.—I am not in favour of the construction by Government of wells in the land which is private property as it would entail a heavy expense.

No. 40.—Temporary wells are not used in this district.

- 1. Q. (The President)—You are Mamlatder of Bagal-
- 2. Q. How long have you been in that place?—For the part six months only; before that I was District Deputy Collector for two years in charge of Indi and Sindgi talukas of this district.
- 3. Q. Have you seen a great deal of black cotton soil in this district?—Yes.
- 4. Q. Do they make wells in it or not?-Not in very black soil.
- 5. Q. Why !-Because there is no water strata or springs at the bottom.
- 6. Q. Wells don't pass through rock in this district?—No.
- 7. Q. They merely go down to the soil?—Yes, there is urst black soil, then muram and then rock.
- 8. Q. Sometimes the black soil is so deep that they don't go through it at all?—Yes.
- 9. Q. In that case wells do not sacceed P-No.
- 10. Q. You say that a well with two mote ordinarily irricates eight acres of land except in a year of drought when it only irrigates half that area. What is the reason for that; why should it go down as much as half P—Because the level of water goes down, consequently it is very troublesome to raise water.
- 11. Q. Does a well often run dry altogether?—In a year of drought it does, but in ordinary years it does act.
- 12. Q. Dors not a cultivator use greater economy in regard to water in dry years?—He irrigates only a small area in such years.
- 13. Q. You say "about 50 per cent. of the cost of a well is paid generally by Government by 10caus of takavi for the construction of wells." Would the rayst not have to go to the sawkar for the difference?—He would not get it as he has mortgaged his own land for the takavi and would tind it very difficult to get mosey from the sawkar.
- 14. Q. You propose that Government should give the sum required to complete the well?—Yes.
- 15. Q. Do you think a number of wolls are left uncompleted?—Yes; nearly one-fourth-
- 16. Q. They are not used ?—No. Either the site chosen was a bid one, or they may not have had sufficient funds to complete the well.
- 17. Q. Do you think that it is desirable that there should be extension of wells in the country for the good of the people?—I do.
- 18. Q. What would you recommend as the best means to protect the country in case of another faraine occurring?

  —Instead of wells the rivers should be bunded up to stop the water from running into the sea; and large irrigation tanks should be built after making caroful irrigation surveys.

- 19. Q. Suppose that is found too expensive, then you would recommend the construction of wells?—No, not in the black soil.
- 20. Q. Then what about the people who live in the black soil areas?—They would have to leave their villages.
- 21. Q. If you make bands on the rivers and the rivers ran dry then the bunds will rua dry?—We could keep a supply of water in the reservoir for two years.
- 22. Q. Then you must have reservoirs?—Yes, we must construct a tank that will store a two years' supply at least.
- 23. Q. You have one such tank—the Muchkondi—on which apparently a good deal of money was spent, but it irrigates only 40 acres ?—About 100 acres.
- 24 Q. Well, even that is not encouraging ?-No, not at all.
- 25. Q. What do you think is the reason of that?—It does not hold a sufficient quantity of water.
- 2G. Q. We were told that every year water is loft in it and that the people never use all the water?—That is the case, but if water was available regularly they would use it
  - 27. Q. Are you satisfied about that?-Yes.
  - 28. Q. The tank is in your taluka?-Yes.
- 29. Q. (Mr. Muir-Mackenzie)—How many years have rou been there!—Only for six months. I was Chitnari here for two years and then District Deputy Collector.
  - 30. Q. Were you not there before 1806-97 P-No.
- 31. Q. In 1895-96 where were you?-In the Karwar District.
- 32. Q. (The President)—Could you give me may reason as to why the people are using the Muchkundi tank so littlef.—They do not use it because the supply is uncertain.
- 38. Q. Do you think that the period of 10 payracat for taken ought to be extended to 20 years f Yes.
- 34. Q. Could you tell us why the full limit allowed by law is not allowed?—It is not the practice. I cannot say why.
- 35. Q. Everybody seems to think it ought to be done, but nobody does it?-No.
- 36. Q. Do you think it would be a good thing if Government gave takeri freely for wells !—Yes; there could be no harm in that.
- 37. Q. Do you think it would induce people to make wells?-Yes.
- II. Q. Van wardik recommend it. for the black relican will country  ${}^{p}$ —No.
- 39. Q. What do you propose to do thore?—Nothing is possible there.
- 40. Q. (Mr. Ibbetson)—Suppore you gave them canal water, what then !- They would use in bad times.

Mr. Hlide. 6 Jan. 02.

- 41. Q. Only in bud times?—Yes, in ardinary years they can do without water.
- 42. Q. (The President)—In what part of the country is the proportion of black cotton coil the greatest?—In the eastern portion.
  - 43. Q. Not in the western parts ?-Na.
- 44. Q. (Mr. Ibbetson)—In this black soil what crop do they grow ?—They graw cotton, rabi, juari, gram and wheat.
  - 45. Q. Mostly ?-Rabl, justi and wheat.
  - 46. Q. Nat mostly cotton ?-Na.
- 47. Q. You say in your note that when a man has made a well fram his own money the cancession is that assessment

- is not increased during the currency of the present settlement?- Tes.
- 48. Q. What happens at the revision of sett'ement?— The improvement is taken into consideration and the assessment is increased.
- 49. Q. He gets enhanced assessment on account of it?—
- 50. Q. (Mr. Muir-Mackenzie)—Dun't you know that the provisions of the Lund Revenue Code expressly lay down that the improvements of myats should not be taken into consideration in making a revision of the settlement!—There is to be no increase during the currency of the settlement anly.
- 51. Q. Na increase even at the revision of scittlement?' -- I did not know that.

# WITNESS No. 70.—MR. RIMCHANDRA HANMANT BRYUR, Mumlatdar of Indi. Answers to printed questions.

Mr. Bevur.

- 1. § 1.—The saswers below refer to the Indi taluka in the District of Bijappr. I have been Momlatdar of this talukn for nearly three years, and I have had many opportunities of being sequainted with the taluka.
- 2. § 2.—The rainfall for the last nine years is as follows, there being no recard thereof before 1892:—

Years.							Inches.
1892						•	47.65
1893						•	40.7
1894			•			•	21.66
1895							27:35
1896			•				<b>~13.33</b>
1897	·	Ċ					22.57
1898		ì	٠				24:45
1899			_				12:35
1900	·	·		ì			16.53
7000	•	•	•	•	-		

The decrease from year to year is worth noting and the question of the reservation of some areas for the growth of trees, which attract clouds, may be considered.

The average monthly rainfall for the lust nine years is

Months.						Inches.
January					•	.02
February		•	•			.036
March .						•38
April .		•				•73
Mny						1.29
Juno .						2.54
July	•					3.05
Aogust .				•	•	3.16
Septembor						7.84
October .			•			4.38
November	•					0.73
December				•	•	0.0
					'	25.163

- 3. § 3.—There is no obstacle to the extension of irrigation arising from—
  - (1) sparsity of population;
  - (2) insufficient supply af cattle ; or
  - (3) inenfficient supply of manure;

but there is some obstacle an account of-

- (4) the unsuitability of the black soil to irrigation;
- (5) the uncertainty of the supply of water;
- (6) lack of eapital ; and
- (7) fear af enhanced revouue.
- 4. § 4.—Under the present law (Section 107, Bom., L. R. Code) assessment cannot be increased on necount of improvements effected by private capital. Tenants scarcely undertake any work of improvement at their own cost, there being no tenants af permanent tenaro in this talnka.

5. § 5.-Leans under the Land Improvement Act are freely taken by the people for the construction of wells and the erection of large dams.

I am not in favour of-

- (1) reduction of the rate of intorest, or
- (2) remission of interest;

hnt I recommend partial or total remission of ndvance in case of partial or total failure of the attempt to obtain water. The present rules are sufficiently liberal as regards the period of repayment, which can be extended up to ten years by the Assistant or Doputy Collectors.

- . I cannot recammend any grant-in-aid as people will attach very little importance far such small money rewards. The only encouragement that occurs to my mind is that if any landbolder constructs any canal or well coas to irrigate a certain area, ahout one-tenth of that aren may be declered so his Inam with or without a fixed judi. It is said that in old times the Rajahe af Mysore had made it as a rule that anybody might constroot any irrigational works anywhere, and he would get ane-tenth af the area thereby irrigated as his Inam; and the above suggestion is based on this tradition.
- 6. § 6.—Extension of irrigation is not at all likely ta injure the remaining cultivation by attracting its cultivators.

People do evinae a strong desire to have the means of irrigation increased.

#### B .- Canals of continuous flow.

- 7. § 7.—There is only one could of continuous flow in this thinks. By creeting a temporary dam across the Indi Nala water is diverted to the ennal which is about a mile in length, and it irrigates 17 fields of an aggregate area of 115 neres. In this irrigated area two harrests are generally cultivated. Generally there is no difference in the yield in a year of ample ranifull or in a year of ordinary rainfall, for the increased water cannot rise to the ordinarily unirrigated portion of the lands; But in a year of drought the yield is reduced by nearly half or sometimes more.
- 8. § 8.—The approximate increase of produce per acreduc to irrigation can be estimated at—
  - (1) three times the ordinary produce of a narmal year of ordinary rainfall;
  - (2) twice the ardinary produce in a year of drought."

Generally an acre of such land when not irrigated produces about 4 bags of earn, generally joars, but when irrigated produces about 12 bags of whent or paddy; and in a year of drought the yield would be about 8, instead of 12 bags. Money value cannot be given as the same depende upon the prevailing prices of the different kinds of

9. § 9.—This Indi Canal is owned by the owners of all the 17 lands jointly, and when my land is let to tenants a fixed rent is levied. The tenmt now pays a rent of about Rs. 12 per nore, while if the land were not irrigated ho would have paid Rs. 3 per acre; thus the increase of rent is Rs. 9 per acre due to the canal.

Ordinarily lands of the same soil as these are assessed at Ro. 1 per nere, but these lands on account of the irrigation advantage are assessed at Rs. 6 per acre. Thus the enhancement of revenue is Rs. 5 per acre. The enhanced revenue is fixed once for all on the whols irrigable area in ench sorrey number at the time of the last Bevision Settlsment.

10. § 10.—The annual cost of repairing the canal (which is not in any way built) comes to about Rs. 100 or Re. 1 per acre of the land irrigated. This expenditure is borne by all the ewners of the irrigated lands in proportion to their mreas. To prepare the land for irrigation about three times the cost of a dry crop land is necessary. The calianced expenditure may be approximately estimated at Rs. 3 per acre. When the land is worked by a teanny he incus this increased expenditure, and this fact is taken into consideration when tixing the annual rent.

11. § 11.—The water in the canal is never too profess to canae ony damage whatever.

## " C .- CANALS OF INTERMITTENT PLOW.

- 12. §§ 12-10.—There are some small canals to the villages of Horti, Halgunki and Kolorgi, which ran about six or eight mouths of the year. They are worked and used on the same lines as described above. The increase of assessment is the LaGanal that of runt is the increase are. The total area irrigated is the three villages is about 100 acres.
- 13. § 20.—The cost of repairing the canal is about four annas per acro. The canals are two small to require any legislation.
- 14. § 21:—The canals in those villages os well as in Indi are constructed by private persons. Scarcely any difficulties arise in the distribution of water as hours are fixed for each of the lauds under the command of the canal. It has never been found necessary for Government to take over the management of these canals.
- 15. § 22.—In this taluta there are very few sites suitable for the construction of further small caush hy private persons. Lorge projects however are possible in some places which must be undertaken by Government as they are likely to cost very large sums. I enclose herewith a statement of suggested large irrigational projects, which I once cabmitted to the Collector.

#### D.-TANKS.

16. §§ 23-33. There are no tanks in this taluka.

#### E .- WELLS.

- 17. § 34.—In thie túluka-
  - (1) the average depth of permanent wells is 40 feet;
  - (2) the supply of water is generally from springs and it is liable to fail in a year of drought only. The water never becomes salme.
  - (3) The average cost of construction of a well is-
    - (a) Rs. 300 in the case of a kachcha well, and
    - (b) Rs. 700 in the case of a pakka masonry well.
- 1. Q. (The President.)—You say in paragraph 5 of your momorandum "I am not in fuvour of (1) reduction of the rate of interest, or (2) remission of interest, but I recommend partial or total remission of advance in case of partial or total failure of the attempt to obtain water." Do you think the present rules are sufficiently liberal?—They can be extended up to 20 years, in practice they are extended only to to nearly 20 years is not given.
  - 2. Q. Twenty years ought to be given ?-Yes.
- 3. Q. You say again "there is only one canal of continuous flow in this taluka. By electing a tomporary dam across the Indi Nala water is diverted to the canal, which is about a mile in longth, and it irrigates 17 fields of an aggregate area of 115 acros." That is a tomporary bandhara?—Yes.
- 4. Q. Is there only one of these bandharas? Why don't the people make more?—There is only one.
- · 5. · Q. Is there any reason for that; is the whole of the water taken up?—The whole of the water is taken away, but since re-appears below the bund.

(4) A kachcha well lasts for about 50 years if care is taken to repair it every year, and a pakka well may last for about 100 years. Wells are often liable to be damaged in ease of very excessive rainfall.

Mr. Beenr. 6 Jan. (12,

- (5) Water is raised by môt. .
- (6) The average nrea commanded by n well is about six acres.
- (7) The average area irrigated in any one year by a well is about five occes.
- 18. § 35.—By mot irrigation two harvests can be contivated and also more valuable crops can be substituted for the less according to the convenience of the cultivator. On this account the value of the produce is increased to three times the dry-crop produce.

The yield also increases-

- (a) to three times the quantity in a year of ample rainfall;
- (6) to two times in a year of scanty rainfall; and
- (c) in a year of drought about 25 per cent. less than the ordinary dry-crop produce.

The cost of working môt is rather heavy. In e year of drought wells are often liable to fail and are required to be cleased of the silt or deepened if necessary which also costs a substantial sum.

- 19. § 36 -(I'ido paragraph 8 above).
- 20. § 37.—(1) The tenant pays about Re. 1 per acrs as the extra rent on account of well-irrigation. (2) The Government assessment is not generally increased on account of well-irrigation.
  - 21. § 38.—No serious difficulties ore encountered-
    - (1) in the selection of sites for the wells, or
    - 13) in the actual construction thereof.

No assistance in any shape whalever has ever been offered by Government or local bodies to the people in the construction of wells. The only assistance the people would require is in the selection of a spot where the required anpply of water would be obtained, and this can be done by the appointment of an expert officer for the district.

- 22. § 39. I am not in favour of the construction of wells in private lands by Government for various reasons. The construction of a well by Government costs a far more heavy sum than what would be incurred by a private person, who would therefore be very much rejuctant to bear the burden thereof. The Government officer in charge of the work and the owner are not unlikely to be in coulliet as negards the shape, size, etc., of the well. People have some superstitions of their own, and the officer would not readily accede to their wishes ie all minor particulars.
- 23. § 49. Temporary wells called Budkis are sank in the beds of nallas and used for growing some fodder or other crops. They are a very small protection against drought. Wherever possible people sink such Budkis and no encouragement is needed. In this talukn sites suitable for such Budkis are very few.
- 6. Q. Have you any other rivers in your taluka?—Yes, the Bhima; 23 villages are situated on the river.
- 7. Q. You say there are some small counts in the villages of Horti, Halgnuiki and Kolargi. What river are these upon?—They are small strenms, simply nains, they have small temporary bandharas; since 1896 water has very seldom run through the canal and very small areas have been irrigated from these streams. I find that in 1895-96 there were 100 acres irrigated, in 1896-97, 80 acres, in 1897-98, 110 acres, in 1898-99, 103 acres, in 1899-1900, 86 acres and in 1801 there were 113 acres.
- 8. Q. This one bandhard takes off the whole of the water?—Yos, but some water comes out by percolation.
- 9. Q. You say in paragraph 15" in this taluka there are very few sites suitable for the construction of further small canals by private persons. Large projects, however, are possible in some places which must be undertaken by Gararmana as they are likely to cost very large sams." In saying that have you any places in your mind's cyc?—Yes, please see list accompanying my memorandum.

Mr. Becur.

- 10. Q Have you discussed these at all with the Executive Engineer?—No.
- 11. Q. How long have you been in this talnka f—Three years, I was also 3½ years io Indi before.
- 12. Q. These nalas that you mention on page 7, was there any water in them in these years of drought?—In the hot season there is very little water, if bandharas are huilt the water will remain.
- 13. Q. Will it he worth while to huild bandharas there?
  -Yes, because some lands are sure to be irrigated.
- 14. Q. This Indi canal is managed by the people themselves?—Yes.
- 15. Q. Do you think if Government huilt bandharas on these streams that the people would orrange the irrigation?

  —Yes.
- 16. Q. In places where there are no nalas, what do you do?—So far as Indi is concerned, it is full of nales. If the flood water of all the valos was availed of the taluka would be protected to n great extent. Sluioo gates may he constructed on rocky edges of nallahs and the river through which inundation water might ron to taoks kept ready previously excevated; and these taoks can irrigate the lands erocoed in winter and summer.
- 17. Q. Have you any figures of the irrigation on the nallabs in these years of droogbt?—No.
- 18. Q. How long would water remain in these nallahs that you have mentioned here in a year of drought?—I think oboot five or six mouths.
- 19. Q. Up to Mnroh?—It will accumulate in the rainy season and last for five or six months
- 20. Q. Hove these nales water in them now ?-Some are running.
- 21. Q. (Mr. Higham.)—You speak of dry stons dams, how do they hold water?—The walls are built of dry stone with mud.
- 22. Q. Does the water leak through?—Not if it is sufficiently thick, there are mesonry duets in the middle to allow the water to go through.
  - 23. Q. When were these made?—Ahout 40 years ago.
- 24. Q. When did they breach ?- About 20 years ago.
- 25. Q. How have you ascertained that?-From what I have heard from the old people of the village.
- 26. Q. I suppose they had no waste-weir?—The reason of ite boing breached is owing to the waste-weir being too small or to excessive rain.
- 27. Q. Do yoo know of bandharss having been huill by private parties oince the last settlement?—No.
- 28. Q. None ore heing hailt now?-No.
- 29. Q. Are there ony places in which they might be huilt?—Yes on these smoll nales they could be built.
- SO. Q. Why don't they boild them?—It would not irrigate one field only, but come others, and combination is not possible among the rayats.
- 31. Q. They used to combine to build them, they combined to build those you spoke of—the Indi Nuln?—That has become n constom emong the Indi people as the bandhara has been existing since over n hundred years; they do combine now to renew it; but it is only a temporary bandhara constructed every year after the rains.
- 32. Q. Then the other works that you mention are also huilt by private people?—They only irrigate a few fields.
- 33. Q. Do you think the people used to combine and that they eacnot combine may longer P—It oppears so.
- 34. Q. What is the reason of that?—Each thinks himself wiser than the other. No particular reason can be assigned for this.
- 35. Q. Supposing they did make the bandharas, what would they have to pay in the woy of water-inte?—According to the quantity of the woter, the rate would range from Re. 1 to Rs. 4 an acre.
- 36. Q. Would that he a water-rate?-Yes, additional
- 37. Q. (Mr. Ibbetson.)—The Indi people pay Rs. 5?—Yes, a consolidated assessment of Rs. 5 per ocre.
- 38. Q. (Mr. Higham.)—Sapposing they hadn't to pay anything to Government for making a bandhara, do you think they would make it then, and would it indues them to combine?—Yes, but they would have to be pointed out the site of the bandhara and the position of the canals.

- So. Q. (Mr. Ibbetson.)—You say in your note that in your taloks "tenants scarcely undertake any work of improvement at their own east, there heing no tonouts of permanent tenure." Do you think there ore many tenants who would undertake works of that sort, if the law protected them?—Xes.
- 40. Q. Do you think many of thom are sufficiently well off?—Yes, there are a few, not many.
- 41. Q. Supposing that opart from the permanent tennre, the law secured a tenant for a certain time till the value of his improvement was worked out, would that he sufficient, do you think?—It would not be sufficient naless he had a permanent tenore.
- 42. Q. You say that you would not extend the period of repayment beyond ten years, do you think ten years is enough?—It may be extended to 20 years.
- 43. Q. You say in your meme, regarding the construction of wells "I conuct recommend any grant-in-aid as people will attach very little importance to such small money rewords." Supposing Government said to the people of a very had tract in the district, "if you make a well, costing Rs. 300, we will give you the whole and will coly recover Rs. 400, the other Rs. 400 hoing a free gift." Woold that be on inducement to them to huild wells ?—Yes.
  - 44. Q. Would that not be a great inducement ?- Yes.
- 45. Q. You did not refer to that when you said you would not recommend a grant-in-aid?—No.
- 46. Q. You say "the only encoorsement that occurs to my mind is that if any landholder canstructs any caoal or well, so as to irrigate a certain area, about one-tenth of that area may be declored as his imam with or without a fixed judi." Has that been tried?—No.
- 47. Q. Will that io your opinion he an ioducement?—Yes, it will go to their posterity.
- 48. Q. Have you had any experience of an arrangement of that kind in Natire States ?- No.
- Mr. Rajaratna Malr. explained that Government relinquishes dry assessment on one-tenth of the land, but takes wet revenue on the romaining area.
- 49. Q. You say on page 4"the average area irrigated in any one year by a well Is about 12 neres." How many mots would that he?—Twelve is a mislake, it should he five or six, there would be one mot.
  - 50. Q. Would one mot irrigate fire or six acres ?-Yes.
- 51. Q. Do you mean that they would work half in the kharif and half in the rabi?—There wil be no difference, eix ocres would be nader irrigation at the same time.
- 52. Q. How long bave yon been in this district ?—I have been here these three years, before that I was here for three years.
- 53. Q. What happened to the wells in 1898-97, did they fail much?—I was not in this district at the time.
  - 54. Q. In 1899-1900 did they fail much ?-Yes.
  - 55. Q. When did they begin to fail?-In January.
  - 56. Q. Did they get worse and worse?-Yes.
  - 57. Q. Werother worse next year ?—Yes. 58. Q. And worse still this year ?—Yes.
- 59. Q. Now this year what proportion of the ordinary area will they irrigate?—Only nbout half.
- 60. Q. So that the failure in the first year was not a
- large proportion?—No.
  61. Q. Would they irrigate four-fifths?—Yes, one-fifth failed in the first year.
  - 62. Q. And ooo-holf after three years ?-Yes.
- 63. Q. (Mr. Rajaratna Mdlr.)—You said there is difficulty in inducing rayats to combine to construct a bandhara; supposing that a capitalist is allowed to lovy a water-rate on londs helonging to other rayats for water supply from the bandhara, will that ho sufficient to induce them to construct bandharas?—Yes, that will he no inducement to some extent, the sowar or capitalist will indoce them to toke water to ensure his water rate.
- 64. Q. Supposing he levies the useal water-rate from other people and that his own payment to Government is redoced to one-balf or one-third, will that act as a further inducement to construct bhandaras?—Yes.
- 65. Q. (The President.)—Cannot the Mamlatdar induce them to combine just as well with a little personsion, why do you require to got the soncer in?—In some cases it is possible; the selection of the sites must be made by expert officers; if once it is constructed, they will combine.

- 66. Q. (Mr. Rajaratna Mdlr).—How large an area will be brought under irrigation if all the nallahs in your talaka are fully utilized?—About 30,000 to 40,000 acres if all the nallahs were utilized; the flood water could olso, be availed of to some extent.
  - . 67. Q. How high is the kacheha band on the Indi?—About four to five feet high.
  - 68. Q. You say in pargraph 20 "The Government assessment is not generally increased on account of well irrigation." Some people four that the assessment will be increased?—Enhancement of assessment depends on prices, it is possible that the essessment will be raised to some extent.
  - 69. Q. (Mr. Muir-Mackenzie.)-In your toluka there are n great many tale !-- Yes.
  - 70. Q. De you think a great many more might be made?-Tes.
    - 71. Q. Do you think they are beneficial ?-Yes.
  - 72. Q. In whit way?—They are generally on the slope of the fields and water accommlates inside these tals, besides which mud silts there and a good orop results.
- 53 Q. Is there a crap eran in a year of draught?—Yes; a good crop wherever the water neumulates; this year we have a good crop behind these 'arnis' the special term of this talukn for "Tals."
- 74. Q. Yon were in the taluka during the famine?—In this famine, act in 1896.
- 75. Q. What were the people chiefly employed on P-Most of the people left the district and went to other places.
- 76 Q. Were there any famine relief works? Yes; the Sangogi tank work-
- 77. Q. Wonld'it have been n good thing to employ them on making bunds and tals or arms?—The arms have to be built on private laads, and it is not possible for Government to build thom.
- 78. Q. Why ?-The owner might have his own way of building thom, and the two ogencies might not agree.
  - 79. Q. Do you think the owner would object ?-Yes.
- 80. Q. I don't mean that the owners have to pay if Gorerument build it P—Then they will agree, people have superstitions as to the direction in which to construct the works and the day of the week to begin, but such slight difficulties could be got over.

- 81. Q. There is not much black soil in your taluka ?-
- 82. Q. Only on the bank of the river ?-Yes, and in the castern side of the taluka around the village of Tambe.
- 88. Q. Wolls are mostly snak in muram?—Yes, and in white soil also.
- 84. Q Have you found many disased wells in your talukn?—Yes.
- 85. Q. When were they made?—About 50 or 100 years age; they have been allowed to lie anrepaired as they got damaged by excessive rain and the rayats could not rebuild them, in the famine such wells were utilized when the rayats could got money to repair them.
- . 86. Q. Very often then a disused well might become ascful in a year of famine?—About 25 per coot. of the disused wells came icto use in this famine.
- 87. Q. Have yoo ever heard that rayats object to take takavi on account of the rigidity of its collection?—There are very few who are relaciant to take it; in a good year they may not be so ready to do so and some coacession should be allowed.
- SS. Q. What concession f—The attachment of movable property should not be taken in land for at least six ments after the date of default and one year in the case of immovable property; one year might be allowed before bis land is attached for payment of takavi. To ensure prompt payments of the advances, the Mamlatdar may be authorized to sauction takavi up to Rs. 200 or Rs. 500. If the Mamlatdar can senetion takavi up to Rs. 200 for seed machtle, as is the case new, there is no reason why he should not sanction up to the same amount for land improvement.
- 89. Q. You don't think that instalmoats should be longer?—They might be extended up to 20 years.
- CO. Q. You say the present rules are sufficiently liberal?
  —They could be extended ap to 20 years, but ten years has become the practice.
- 91. Q What is the reason that it has become the practice?—I don't know there may be some old orders on the point.
- 92. Q. (Mr. Ibbetson.)—Beyond ten years, do you send to the Collector?—Yes.
- 93. Q. You can smotion ap to ten years yourself?—The Assistant Collector can do so, the Mamlatday has no power to sanotion taken for land improvement.

Witness No. 71-Ma. Daso Balwant Berioedi -- Mamlatdar of Hungand, Bijapur District.

Answers to printed questions.

3. Small tanks constructed in black soil will certainly hold water if the soil is dug out 15 feet deep and on earthen dam of sufficient width is put up. The dam of course should have neore wall of dry stone inside and the other side of the dam should be lined with a thick layer of muram, or else the dam should be lined with a thick layer of the water current. No maseary wall is required, save the inlet and the sluice, which should be of maseary work. But there is one great defect in the tank of the black soil. It is generally silted up very quickly. The silt will have to be removed every decade of years and with this recurring expenditure the tank will be a success. Of late the rainfall is said to have been seantier every year compared with the fell before twenty years back. Asseming that the average rainfall is good there is not much demand far water for codinary dry crop. If water be made evailable people will not only make use of it in prolonged drength, but also for growing garden crops, which will only be grown by irrigation even in favourable years, because the garden erep is much more paying and profitable than the dry crop. In the case of black soil the demand for water is nover slack even though the rainfall be very good and the revenue will nover be precarious on acceant of the fulling off of the irrigated area. Owing to apathy end slevenliness on the part of the cultivators in thus taluka they were content with whatever the lands used io yield, and the land was generally yielding a bumper crop as the rainfall was plontiful and seasonable in good old times. But series of inilure of crops since the great momerable famine of 1877 has stimuleted the cultivators to device and array out all possible agion tural improvements, and the conversion of the dry crop into garden crop land is considered to be the best and safest improvement. It will therefore be seen that there will certainly be as much demand for irrigation in black soil, and the construction of tank for black soil is considered as

remunerative and as important os for other classes of seil. The irrigational prespects in lands which are mostly black soil under the command of the Gokak Ghataprabha canal will bear me out. I may also add that a greater area of irrigated land under the command of Mugad Tank in Kod Taluka and Dharma canal in Haugal Taluka in Dharwar Collectorate is black soil. From my own personal experious I may say that the part where Ghataprabha canal in Gokak Taluka now runs was constantly liable to famine. But siace the opening of the casel famine is not heard of

there.

7. Yes. It is both possible and desirable to slimulate the construction of new wells by more liberal advances and inducements. The only practical inducement I one suggest is to make advance without interest. Owing to the long drought I am sold about a dezen of wells ran dry and have been deepend, of which I have seen five and found in them a sufficient supply of water. I have not come across with any instance in which an old well which ran dry was deepened and abandened for want of water, but I have seen two now wells which were dug up and abandened as the water was not struck and the further excavation was likely to entail considerable expenditure which the owner was unable to previde. Average depth of water below surface in this taluka is 45 feet, and the cost of the well varies according to its size and the quality of sub-soil and the distance at which stones are obtainable. On an average the cost is about Rs. 800. Generally the part of the well below the pulleys to draw water from is constructed in this taluka with stone and mertar and the other part of the well with dry rubbles only. The average area served by each well with one met and one pair of bullcoks is three acres.

8. The truet in this taluka having been almost plaiu, erops are never heard of as having been injured by water-

Mr. Bevur. 6 Jan. (12.

Mr. Betigeri. 6 Jnn. 02. Mr. Beligeri. 6 Jan. 02.

logging or excess of water in very wet years. Drainage works logging or excess of water in very wet years. Drainage works are therefore not required on agricultural grounds. Small pits dag out for depositing manare adjacent to the village site are seen in some villages. Water stagnates in these plts which are objectionable on smitary grounds, but such nuisonces can be pat a stop to by the adoption of vigorous measures under the Polico Act. No drainage works are therefore required even on sanitary grounds.

10. The relief works entered in the famine programmo that have been executed during the last famine may. I think, be maintained in good order; otherwise large ontlay incarred by Government during the famines will be deemed to have been wasted. I do not think it necessary for extending or completing the works entered in the programmo until the next famine. But I would respectfully suggest the insertiou, as a large relief work, of the Balkundi Nala. My proposal on this work will be submitted next month after visiting the work one one.

14. No large irrigation work was constructed either by Government or by public with the aid of tagai advances during the famine of 1897. No information required in this paragraph can therefore be giren.

#### A. - GENCEAL.

- 1. The foregoing answers belong to the Hungund Taluka, Bijapur District. As a District Inspector of Agriculture for about two years in this District and as a Mainlatder of the Talaka for two years and as an owner of loud inigated by caual water and well water in Gokak Taluka, I have had the opportunity of making myself acquainted with the subject and the taluka.
- 2. The average minfall for the past five years as compared with that for five years previous to them is given in the subjoined table:—

M	euth.			from	e rainfall 1892 to 696.	Average rainfal from 1897 to 1901.		
				In,	cents.	In.	cents.	
Jaquary								
February			•			0	19	
Maroh	•			0	50	0	41	
April				0	88	1	67	
May .	•			1	37	l	23	
June .				1	55	3	G3	
July .	•			3	39	1	9	
August	•			3	48	3 1 1	20	
Soptember				1 3 3 4	96	8	33	
October				4	10	8	38	
November				1	12	0	92	
December	•	٠	•			0	1	
	Тота	AL.	٠,	21	8G	23	34	

- 3. (1) The total area of the taluka is 520½ square miles and the total population occording to eccase of the current year is 63,615 as compared with the cenase population of 102,594 for the year 1891. Owing to series of drongbts for the lest five years many have emigrated to the Nizam'e territory. Some have roturned after the census and all the remaining persons will return if the prospects of the season promise to be good. The propolation consists more of agriculturists than other classes. I do not therefore think that the agricaltural population is sparse in the taluka.

  (2) Thore are 12.654 heads of planch cattle in the current.
- (2) There are 12,654 heads of plough cattle in the current year as compared with the number of 20,057 in the year 1895-96. The decreose is due to series of droughts from 1896-97. The cultivable area for the last year was 288,142 acree and the area cultivated 238,466. The ratio of cattle to accompany the last year was 238,142 acree and the area cultivated 238,456. The ratio of cattle to acreage of caltivated area comes to two bullooks for every 36 acres. The namber of plough cattle required for black soil is less than the number required for other classes of soil. Ordineitly two bullooks are sufficient to caltivate 32 acres of black soil and 20 acres of red soil. There are two classes of irrigation, one by drawing water from a well and the other by the flow-water of a canal. In the latter case no bullooks are required to draw water, but two ballooks are sufficient to oultivate 12 acres of irrigated land; while in the former two bullooks are required for every two ocres to draw water and oultivate. The area irrigated by well will be far too limited as compared with the area irrigated by canal water. This will show that the present stock of eattle is insufficient. However, this will

readily be incressed if the prospects of the seasons be good for four or five years and the good prospects of irrigotion he held out to cultivators to hoot.

- (3) The black soil being generally fertile (the taluka being almost of black soil) it can grow dry crops without manare. The censars of all sorts of cattle for the current year is 35,376, and other animals amount to 30,800. It is roughly estimated that each cattle will yield five cart-leads roughly estimated that each cattle will yield five cart-leads of maanre. Each irrigated aere will require about 50 carts leads of manure. The present produce of manure will on this whole be sufficient for 5,000 aeres of irrigated land. The total irrigated area at present is only 554 aeres in the taluka. Bone manure and oil-cake manure is not used in this part of the country. When once canal is introduced this manure too will he mode use of. So it will be seen that there will not be insufficiency of manure.
- (4). The block soil is not unsnitable to irrigation. (4). The block soil is not unsuitable to irrigation. I can say from personal experience without any fear of contradiction that the soil under the command of Gokák Ghataprabha canal in Belgaum District and the Hongal-Dharma canal and the Mudag and Dumbal Tauk counts in Dhárwár District is all black. Rice, maize, sugarcane, chillies, rod potatoce, brinjals, garlio, betol-leaves, onions, and torts of vegetables, the fruit trees, such as plautain, grayus, lemons and coccasant trees are grown in abundance. guavas, lemons and eccoan at trees are grown in obundance in black soil. Mango, apple and other frait trees which are poenliar to the red soil are not grown in the black
- (6) Certainly more capital is required for irrigated crops, both for initial and annual expenditure than for dry crop. I estimate annual expenditure to be Rs. 75 per acre in the case of oanal water. The oultirator will manage somehow to bear this expenditure with the sanguine expectation that the outturn of crops will far outweigh the annual outlay.
- (7) I do not think that onlivators will shirk from making use of frigational advantage for fear of enhanced rate, rout, or revenue assessment, because the water-rate will be quite commensurate with the additional profit they receive from the irrigated orops.
- (8) The present tenure under the Land Rerenuo Code does not seem to throw ony obeloole in the way of extension of irrigation. But the restricted tenure proposed under the Amendment Act of Land Revenue Code is a great impediment not only to the irrigational improvement, but to all other land improvements. The present Tenancy Law does not oreste any obstacle to the irrigational improvement.
- (9) There are no other reasons against the irrigational
- 4. My office record does not show that any exemption to menhanced assessment for any particular period has been allowed. All I can say from my records is that no enhanced assessment has been levied from Motasthal irrigated land. All Patasthal irrigated land has been levied with the consolidated assessment (Infid assessment together with water-rate). The present provisious are sufficiently liberal, and I do not think any alteration in the existing law is called for.
- 5. No. Not as freely for irrigational work so they take for removing weed or throwing an embaukment. Firstly, because the well work is much more costly than the sum of become the well work is much more costly than the sum of taged they reesive in proportion to the scearity of the land they are able to offer; recordly, on account of the ancertainty of finding water at a reasonable depth. The only practical suggestion I can offer in the way of encouraging the application for loans for the extension of irrigation is the making of trial borings for the people as pointed out in paragraph 38 below. The terms of tagái advance for irrigation should also he made more liberal ond cuticing,
  - (1) Reduction of interest from Rs. 5 to 3 per ceut. per.
  - (2) Remission of interest for the first two years.
  - (3) No partial remission of advance is necessary.
  - (4) No total remission need be granted when trial boring is resorted to as explained in paragraph No. 38 below.
  - (5) The maximum period of repayment allowed under the present rule is 20 years. This period is sofficiently long. But in practice the period allowed doss not exceed ten years. If the maximum period he brought into practice, the present period need not be extended.
- 6. No. Certainly not. When I discussed with the intelligent rayats in my taluka on irrigational motter, they expressed their unbounded joy to see that Government were contemploting some scheme for the extension of irrigation.

B .- CANALS OF CONTINUOUS FLOW.

There are no irrigational canals of this class in this taluka.

#### C .- CANALS OF INTERMITTENT FLOW.

- 12. (1) There are a couple of nalas in this taluka the banks of which are not steep. People dig out a small channel of 3 feet width and 2 feet depth from the higher level of the bed of the nala down to a bank, the level of which corresponds with that of the fountain, and the channel is then load to pass Jewawards through the lead by the side of the bank, as will be seen from the following hand sketch.
- (2) Water in the channel constantly runs about a foot high and is used by the adjoining land-owners in turn amicably settled long before. But the area thus irrigated is very small. The total area irrigated by this process amounts to only 168 acres and 85 gunthas in this taluka.
  - (3) The supply is ordinarily maintained-
    - (a) for six months in a year of ample rainfall ;
    - (b) for four months in a year of scanty rainfall;
    - (c) in a year of drought the supply of water falls too short to raise any crop.
- 13. (a) The supply is not sufficient to grow two crops in a year.
- (b) More valuable crops are grown, such as rice, chillies, red potators and onions, etc. This is generally the hot weather erop. In the monsoon no such erop is grown. The value of the outturn of this erop is estimated to be double that of the dry erop, but it enthils more cost and labour.
- (c) The yield is considered to increase in the case of scanty rainfall compared with the yield of dry erop land. This increase may be said to be double. But in a year of ample rainfall and in a year of stronght no distinction can be made in the yield of this land and the other dry erop land.
- 14. As no irrigated crop is grown in the mensoon there is no necessity to rouly to this question—(1) and (2).
  - 15. No.
- 16. The increase in the total annual value of the produce per acre due to irrigation may be estimated—
  - (1) at Rs. 5 on the average of normal term of years.
  - (2) nothing in a year of drought.
  - The approximate annual rate per nore is as under:—
     Nit.
    - (2) Rs. 2-8-0 in the case of rice land and Rs. 3-8-0 in the case of garden land on the area netually irrigated. But this late varies according to the prospects of the season.
    - (3) Rs. 1-8-0 in the case of rice land and Rs. 2-3-0 in the case of garden land on the whole brigable area.
    - (4) Nil.
- 18. I cannot give what the initial exponditure for constructing this channel would have been, because the channel is said to have been constructed before the introduction of revenue survey.
- 19. No damage has resulted to the people, but the soil is some to be deteriorated from Irrigation without manufe. The supply of water from this channel being hardly sufficient to raise one crop only, there is no danger to the land from the salt efflorescence. Irrigated hand adjacent to a big tank is found to suffer from salt efflorescence owing to water-legging, as I have seen in the case of lands close to the old irrigation tank at Asaadi in Rauebenuar Talukn of the Dharwar District.
- 20. The channel running through the best of the mala which is generally five or six furlange long, requires to be cleared almost every munth and that passing through the land once or twice a year. These requires are done jointly by all the cultivators of the fields brighted by the channel. I cannot therefore give the cost of the repairs. This system works well and no legislation is necessary.
- 21. These channels are said to have been constructed by private persons. The channel running from the bank to the irrigated hand passes through some other lands which are not benefitd by the irrigation. Some trouble might have a isen in the beginning in permitting the channels to pass through those lands, and the owner of the channel might have very likely bought the consent of the owners of those lands. As the area of the channel has been deducted

from the area of the field assessed at the time of the rerenue survey no trouble appears to here arisen to the owners of those lands, nor to the realization of dues from them. There is no necessity for Government to take over the menagement of these canals.

Mr. Betigeri. 6 Jan. 02.

22. I consider it advisable to enconrage and assist the construction by private persons wherever possible, although I know that the water-supply is not so ample as in past years. The main difficulty for private persons in undertaking the work is to obtain the consont of the owners of the fields through which the channel is required to pass. This difficulty can only be obviated by nequiring for the applicants the strip of land required for the channel under the Land Acquisition Act.

#### D .- TANKS.

There are no tanks irrigating the lands in this taluks.

#### E -WRLLS.

- 34 The taluka is divided into two main tracts, (1) black soil and (2) red soil.
  - (1) The average depth of permanent wells is 40 feet in black soil and 30 in red soil.
  - (2) The supply of water in both the soils is generally from springs and in a few wells which are just on the banks of nales from percolation. The supply is not likely to fail in an ordinary year, but it does fail to some extent in a year of drought.
  - (3) The cost of construction varies according to the nature of the sub-soll and the proximity of building stones. On an average the well costs about Rs. 800 in black soil and Rs. 600 in red soil.
  - (4) If the building be strong and the well circular, it can last for any length of time provided occasion at repairs are done to it whonever required.
  - (5) By a mot with two or four bullocks. If the supply of water is abundant and the area to be irrigated is more than two acres, more than one mot is used for one and the same well.
  - (6 and 7) The area commanded by a well depends upon the quantity of water in it. If the supply is abundant three mots are used and the maximum area irrigated by three mots is not more than six acros. Two acres are ordinarily irrinted by a well of a single mot in one year with one pair of bulle ks.
- 85. The irrigation increases the value of the produce by double-
  - (1) By rendering it possible to cultivate two harvests in one year.
  - (2) I'y substitution of more for less valoable crops.
  - (8) The yield does not increase in a year of ample ininfall, but it decreases to a small extent; while in a year of scanty rainfall and in a year of draught the yield necessarily ircreases if compared with the dry orop land, which yields nothing in that year.
- 36. The increase in the total annual value of the preduce per acre due to brigation is estimated to be its. 3 both in a year of drought as well as in a normal year.
- 37. (1) As a role the tonant of garden land pays to the owner some share of the gross produce of land. This share depends upon the fertility of the land, the sneply of water and the competition of the tenants. The share varies from 4th to 4rd of the produce. The value too depends upon the variety of crop grown. On an average the tenant pays to the owner per acre one ropes more than he would have paid for dry crap land on the area actually Inigated.
- (2) No extra assessment or water-rate is paid on account of irrigation by the owner to Government.
- 39. (1) No difficulties are experienced in the case of lands on the banks of nalas, but in other lands difficulties are encountered in the selection of site.
- (2) If the bod of the well consists of hard muram or stene no difficulties are experienced in the construction of the well, but so ions difficulties are encountered if the bed consists of sandy land or mud. These difficulties are often experience of the superstructure. This construction is more expensive and is likely to give way after some years.

Mr. Betigeri. 6 Jan. 02.

No ossistance has been given by Government in the shape of expert advice or trial horing, etc. Iudeed, euch assistance is very useful. There are three Circle Inspectors in this taluka. A boring tool should be kept with each Circle Inspector, who should be taught how to moke trial borings, and he should be instructed to make the trial borings in any villoge at the instance of the Mamlatdar. The Mamlatdar of the taluka should receive applications, and if he be satisfied after enquiry that the applicant is able to undertake the well work and to pay the expenses of the boring if the water is faund, he may issue orders to the Circle Inspector to try it. Assistance should also be given Circle Inepector to try it. Assistance should also be given in the shape of export advice. I would suggest that the nu the shape of expert advice. I would suggest that the experts should visit each thluka every year in the sommer and eacamp in three or four villages in different parts of the tatuka to give to those applying for it their advice in the selection of sitee and construction of wells. One mouth's notice of the date and place of their camp should be given so that people may avail themselves of the valuable advice of the experts.

- 39. I um not in favoor of constracting wells in private lands at Government expense, because there is no generantee that the cultivator will utilize the well water for irrigation, and if at all he uses it no extra rate can be levied from him sufficient to cover the ordinary interest on the amount spent by Government in the construction of well; and if by Government in the construction of well; and if the expenses were to be recovered from the cultivator he would not pay it, because he always considers that the work constructed by Government agency is more costly than that constructed by himself.
- 40. Tomporary wells have begun to be more commonly used only in the year of drought than in ordinary years. Bot the area irrigated by lift water does not exceed helf an not the arch irrigated by a mot does not exceed hair an acro and that irrigated by a mot does not exceed one acro or two at the most. Generally water juari is grown in order that it should afford fodder for cattle and grain for the cultivator to last for two or three menths. The grant of tagai alvances is u sufficient encouragement. No other inducement seems to be necessary.
- 1. Q. (The President).—I believe you are Mumlotdar of Hungand in the Bijapur District; how long have you been there?—Two-and-o-half years.
- 2. Q. Where were you before that?—Before that I was District Inspector of Agriculture in this district.
- 3. Q. You are a land-owner in the Belgaum District; have you a large estate?—Yes, I own about 300 acres in the Gokak Talnka.
- 4. Q. You say in the first poragraph of your note:—"But useries of failures of crops since the great and memorable famine of 1877 has etimulated the onlitivators to devise nud earry out all possible agricultural improvements and the couversion of dry crop into garden erop land is considered to be the best and safest improvement" then you go on to say "there will certainly be as much demand for irrigation is block soil and the construction of tanks for block sails. blook soil and the construction of tanks for block soil is considered as remunorative and as important as for other classes of soil." We have heard the opposite view from most people, who say blook cotton soil will not take water. In the Machadi tank there is water, but the people will not take it?—Black cotton soil if irrigated is profitable.
- 5. Q. You can no doubt give ue the names of places where black soil is irrigated?—I myself have lands with wells in pure black soil, and we get a much better garden crup from them by irrigation. We give black soil water regularly.
- 6. Q. How deep is the block soil ?-The depth is 1 to 13
- 7. Q. What is below that ?-Muiam.
- Which are mostly black soil under the command of the Go-kak Ghotoprabha canal will bear me out. I may also add that a greater area of irrigated land under the command of Alagad tank in Kod Tsluka and Dharma canal in Hangal Taluka in the Dharwar Collectorate is black sil." Do you think, from your experience that in ordinary years the people would take water in these soils if a conol was opened there?—People will take water for such soils if supplied by canals. The lands under the Gokok canal have such, and the water bas been used for percunial crops.

  9. Q. Do you say as contains.
- 9. Q. Do you say so, certainly it is a vory important point?—Yes, in these two cannis the whole area is block cotton soil and the people use the water, and pay the percu-
- 10. Q. How many years have they used it?-Ever since its construction.
- 11. Q. In your taluka are there many old welle which have not been used recently?—No pakka wells have been left naused in Hungund but kachcha wells have been left uaueed. It is only in famine years that kachcha wells are each for drinking water and for watering eattle.
- 12. Q. You say in parograph 7 "the only practical indacement I can suggest is to make the (takavi) advance without interest." Now, the Government interest is 5 per cont, what does the sowear take?—The sowear demands 12 per cent. and more.
- 13. Q. And yet they sometimes go to the sowear to borrow money to build wells !—The cultivators do not go to the cowear to borrow money for wells but for marriages and other purposes.
- 14. Q. Do you think that if Government reduced the rate below 5 per cent. it would be an extra inducement?—As

- an inducement for the countraction of wells I would suggest 3 por cont., or crea less, but the ratu of interest is already low compared with what the sowcare charge.
- 15. Q. Did many people come to you to ask for takani advances?—Yes, many people took advances.
- 16. Q. How much do you generally give of what is asked?

  —I generally look to the seemity he offers. If his land is worth its 200 and he wante Rs. 300 be would not get it. I would not give advances of not more than the value of the land offered as security.
- 17. Q. But if the applicant had plenty of land would you give him the whole of the sum he applies for?—It depends on the orders of the Collector, he sometimes gives orders to give large sams to selected land-owners. In the famine of 1897 the Collector issued orders to the effect that the mancy was to be given out in small instalments so as to give help to the greatest number of people.
- 18. Q. Was that a good policy?-That was a good policy for that particular time
- 10. Q. Wo heard to-day from a witness that if n man who wanted Rs. 500 get only Rs. 250 and he could not raise any more money after the well was taken in hand, that it would remain unfinished?—Yc-, lu some esses wells are left unfinished, but if there is plenty of water the money can be raised from the sowcars or by the sa'e of the crops which the trust mines. the myot mises.
- 20. Q (Alr. Ibbeison.)—I think you said just now that the caltivator never goes to the sower for more to boild wells?—Yes, but if the well is a good one the sower can be got to load money on the security of it.
- 21. Q. (The President.)—Do you think that the best means to induce the extension of wells would be to lower the Interest?—Yes, lower the interest and extend the period of repayment to 20 years.
- 22. Q. But the law allows 20 years?—Yes, that is the law, but that is not the practice.
- 23. Q. Do you find complaints made about the time it takes to get a fakaci advance?—In famino times no delay takes place as a summary process is edopted. In ordinary times the rayat does not care about the delay as he can earry out his improvements in the following season.
- 24. Q. Sopposing that if instead of asking for ropsyment of the advance Government were to assess the land at wet rate, would that be popular or would it not?—It would not be advisable. We would he doubling the assessment. A man would cultivate the land for some years and when it gave out he would allow it to lie follow, and it would be religiously and adventure and would not come forward to relinquished and other people would not come forward to cultivate it.
- 25. Q. The Government would lay on the assessment all the same?—Yes, but the man would relinquish the load.
- 26. Q. What do you think the best thing Government can do for your tslake to enable it to withstand famine?—At Balkundi on the borders of the Nizam's territories there is a nala and I think a good reservoir could be constructed
- 27. Q. You say in your note that your proposal on the enbject would be submitted in a month, have you enbmitted it?—No, I was told that it had already been sobmitted.
- 28. Q. (Mr. Rajaratna Mdlr.)—Was not the scheme said to threaten the submersion of Itkul towa?—No, it was thought likely to submerge Balkundi village.

- My. Beale.—Explained that the witness was referring to the Itkal project which had been unfavourably reported on by Mr. Joyner and condemned by Government.
- 20. Q. Witness.—There are two rivers in my taluka, the Malprahhn and Krishna; on the former I think a dam like that at Gokak might be made.
  - 30. Q. Are there any small tanks in your taluka ?-No-
- 91. Q. Would you advocate the construction of tanks ?—. There are no places suitable for tanks, but many wells could be constructed alongside the nalas.
- . 32. Q. Have the people been constructing many wells lately P—Yes, 178 wells have been made since 1896-07. Some are kacheha, some are pakka; they will all be made pakka as funds permit.
- 39. Q. I see according to the last Census that your population has gone down from 1,02,894 in 1891 to 88,615 P
- 34. Q. Were there a great many deaths or was it due to emigration?—The decrease of population was due to (1) more deaths than births, and (2) emigration to the Nizam's territories.
- 35. Q. Were they better off there? Yes, last year there was a better erop on the borders and the people who erossed over got better wages—they got enough wage in one day to keep them for two in food. There was no fumine in those parts. Most of those who migrated have now returned.
- 56. Q. Has this reduction in the population been only since hat your?—No, the reduction has occurred since the 1897 famine, several people who omigrated to the Nizam's dominions became well off and remained there.
- 37. Q. Did none of the Nizam's subjects come over into British territory ?—No.
- 38. Q. (Mr. Hobitsen:)—It is very common to have emigration in both directions?—None of the Nizam's people come into British territory in our district.
- 39. Q. (The President.)—In paragraph 19 of your printed noto you say—"No damage has resulted to the people, but the soil is euro to be deterlerated from irrigation without manure \*\* irrigated land a liacout to a big canal is found to suffer from salt efflorescence." What do you put the salt down to; do you think it is due to the absence of manure?—Salt efflorescence is due to pleatiful rain and long irrigation. If the rain fall is only sufficient there is no danger of salt efflorescence. You will not find lands irrigated from wells suffering from salt efflorescence. The only lands that suffer are those which get more water than is good for them.
- 40. Q. The best cure would be to drain the land, would it not?—Yes.
- 41. Q. Do you think the extensive use of manure would cure it?—The use of more manure would remedy it. If you irrigate without using manure the laud deteriorates.
- 42. Q. Have you over seen drains n ale to carry it off?
  —I have not seen any drains in this district.
- 43. Q. (Mr. Higham.)—You say that in black soil you can cultivate sugarcane; would you also enlivate rice?—Rice is not grown so much as sugarcane and garden crops.
  - 44. Q. Is whoat grown P-Yes, wheat is grown.
- 46. Q. Supposing Government were to make a large number of irrigation works in this black soil, would there be any demand for water except for cane or other high class crope?—The people do not grow sugareane alone; they grow maize, wheat, juari, plantains and vegetables.
- 46. Q. Up to what percentage would they grow cane?—Not more than 10% of angarcane. If the land is irrigated by a canal they grow more maire and vegetables than augnitions, as sugarcane requires watering to a greater extent than the other crops and is therefore more expensive.
- 47. Q. What about maize !- Maize is grown on all irrigated laudr.
  - 48. Q. When does it want water ?-Once in eight days.
- 49. Q. For how long?—It is harvested in three or four months. Three crops can be raised in one year. It is not a very profitable crop. Only one crup of sugarcane can be raised in a year, but it gives a good profit.
- 50. Q. Is the quantity of maize grown very large? I thought that in the Decean the quantity was not large?—As large as possible on the Gokak canal and any other tank irrigated lands,

- 51. Q. Why don't they grow it under wells?—The area of maize grown under wells is small as the water is used for angarcane.
- 52. Q. If canals were made all over the country, do you think there would be a general tendency to grow maize f
- 53. Q. They would not pay a higher rate?—At present on the tickak canal the water-rate is Rs. 2 for the first crop and Rs. 2-8 for the second crop.
- 54. Q. Why a higher rate for the second crop?—Because it is raised in the hot season and water is more valuable. Rupees 20 is the price fixed per acre for sugarcano.
- 55. Q. Do they never grow wheat ?-Yos, they irrigate wheat, cotton and jauri from the wolls.
- 56. Q. We were told that cotton requires no water ?— They irrigate cotton in Gokak in dry years.
  - 57. Q. Does it require water in ordinary years ?-No.
- 53. Q. You may that it costs Rs. 75 per acro to cultivate irrigated land?—Yes, evon in ordinary yours.
- 59. Q. What is the money spent on ?-It costs Rs. 40 for manure alons in lands through which canals run.
- 60. Q. Is that an anual odarge?— Ves, unless we put down 50 or 60 cart loads per acro, we cannot grow a good erop.
- 61. Q. Supposing you are grawing a crop of maize, would you put down Rs. 40 worth of manure?—In regard to maize we have two crops and each crop would require Rs. 25 to Rs. 30 worth of munure per acro.
  - 62. Q. In black soil ?-Yes.
- 63. Q. You say that where there is tank or canal irrigation there is salt offlerescence which you attribute to too much water, could not the supply of water be restricted in some way?—Yes, it can be ristricted but the poople make channels and lot the water on when they go home at night, and when they return in the morning the land is flooded.
- C1 Q. Supposing the supply of water was arbitrarily limited, they could not waste it then?—That would stop water being used in excess.
- 65. Q. Supposing you were to charge the people according to the quantity of water used and not according to the area irrigated so that if the people are careful of the water they would have to pay so much loss, would that have the effect of making them more careful?—I cannot say, but I know that a man, who is nort to the canal head, is charged for water wasted. He is sometimes prosecuted for wasting
- 60. Q. Does that not make him more careful?—He takes his chance. He is not generally caught as the waste occurs at night.
- 67. -Q. If he lets the water run to waste, you say he can be fined; who fines him f-1 fine him.
- 68. Q. How do you fine him, as a Magistrate or a Civil Officer?—As a Magistrate.
- 69. Q. I suppose as a general rule if a man wastes water the Irrigation Department do not ours to go to all the trouble necessary to presecute?—That is the ease, they only presecute when a man is persistently neglectful or obstinate.
- 70. Q. You say that the culturable area of your taluka is 255,000 acres, of which 238,000 is cultivated. What area is ordinarily harvested?—The cropped area is generally the same as the cultivated area, viz., 235,000.
- 71. Q. Is any of that protected by irrigation?-No, none of it.
- 72. Q. In a very dry year I suppose the whole area caltivated fails?—Sometimes in very dry years much of it fails. There are different kinds of soils. Soft black soil requires less rain than hard black soil. The latter requires very heavy rain. When once it is wet, it does not dry up oasily. If only a safficiency of rain fails, soft black soil gives a good crop. It is on account of these lands that the prophe saffer, for wheat is only obtainable on them when the rainfall is fall. Rod soil isnds yield some orep oven if the rainfall is scarty, but whom rain is plentiful they give less valuable crops than black soil.
- 73. Q. In 1800 what was the proportion of the culturable nies cropped?—Nearly the whole area was sown, but we bad ouly an all-round one-auna crop.
- 74. Q. Did many people go on reliof works ?—A few did, but most went to the Nizaur's State, because they could got remunerative labour there.

Mr. Betigeri.

Mr.Beliges i. C.Jan. 02.

- 75. Q. Why did they go to the Nizam'e territories, had you no relief works?—Wo had two relief warks in our taluks, bot the people preferred to omigrate, as in the Nizam's State the work was lighter and the wage better.
- 76. Q. Could they not live on what they got from their
- 77. Q. Snpposing come portion of the culturable area, sey 10 per cent., had here irrigated, would the awners and labourers of these lands have been protected?—Only four labourers can be occapied on one acre, and if you irrigate 10 per cent. it would anly protect the people living on that area, hat would not keep all of the people of the ather 90 per cent. from going on relief works.
- 78. Q. (The President.) -Is it not a enstom for several families to join together and work a well in a fumine year?

  No, it is not. But it is the custom for families to emigrate to ather coautries, buy some land for Rs. 50, paying say Rs. 10 euch, and maintain themselves on it hy sowing crops till the famine is over. Then they come back. In his own country each man looke to his own heuefit as a rale.
- his own country each man looke to his own hencest es a rale.

  79. Q (Mr. Higham.)—Take one owner only; supposing he cultivates 103 acres, only 10 acres of which are protected; has has a certain number of people living on his holding in ardinary years; drought occurs and he gets only a two-aana crop; would any af his people have to go ou relief?—The owner would employ as many only as are required to cultivate the 10 acres. The labourers turned off for the 90 dry acres would go on relief. It is only Desais and Deshpandes who wauld maintain their people whether they had a good crop or not on the understanding that the people will remain for 10 ar 15 years in their service.

  80 Q. Would they have to go on relief supposing half the
- 80. Q. Would they have to go on relief supposing half the area or 50 por cent. were irrigated? -No, if they gut sufficient to live on they would not go on relief work.
- 81. Q. What would you call harely sufficient ?—A four-na crop. They could easily maintain themselves on a
- 82. Q. (Mr. Ibbetson.)—You say that in the famine a summary procedure was followed lu giving out takavi, what was the main difference between the summary and the what was the main timerence between the summary and the ordinary procedure of lakavi wo dispense with the issue of uptices, we also dispense with the inspection of the land on which the improvements are to be carried out, we do not visit the land and value it, and to be carried out, we do not visit the land and value it, and we do not trouble to find out if the sowear has any lien or mortgage on it. We emply find out whether the land is sufficient searcity judging by assessment or hy enquiry from the paneb or village officers, who accompany the applicant. We make vivd voce enquiries. We generally calculate twenty times the assessment. Unless the land is garden land we can see from the late of assessment per acre what the value is. what the value is.
- 83. Q. Do you think that the Government ran much risk in lending under that procedure ?- No, I think the Government ran no risk.
- 84. Q. Do you think that that procedure could be followed as a critical state that the recedure could be followed in ordinary yours?—Yes, it might safely be followed. Lately u circular order has been issued to the offect that the Manulatdars are to be supplied with all information concerning the register of sales, mortgagos, etc., of lands.
- 85. Q. He will have to refer to the Registrar in future; you think that procedure can be eafely followed?—Yee, we had no meuns of escertaining before.
- 86. Q. You say that your talnka is not enitable for tanks, -Because my taluka is flat and tanks canuot be
- 87. Q. You say that many wolls made in 1896 97 and since were built kachcha and will be made pakka as funde permit, woold it he a good thing if Government could help the people to make them pakka?—Yes, it would he a good thing to help the people to make the wells pakha by the aid of takavi advances.
- 88. Q. If a well is once made you can safely advance more money to make at pakka, as its construction has made the land more valuable. If we after more money naw on favourable terms, would the rayat accept it?—Yes, but sometimes a able terms, would the rayar accept it?—Les, but sometimes a man who bos 5 acres builds a well und the well does not stand, and it has to be built af stone. In my taluku stone is not available and the construction of u well with stone and mortar costs a considerable sum. The man would have to spead more money thus the land is worth. In such a case we could not advance more.
- 89. Q Supposing Govornment was willing to take the risk. Soy a man had epent Rs. 300 on u kackoha well and he wanted Rs. 400 more to make it pakka though his land was

- worth only Ra 500, do you not think that Government might not make the advence; would there not he honest men , who would come to take the men y and ropay it?—It is difficult to discern honest men from athers. I think there would be great risk in giving edvances af some above the value of the land.
- 90. Q. Do you thick there would be any great risk; of coarse there would be risk; but you say Government might lend a good deal for the construction of wells; would it not be worth Government's while to run u little further risk to have the wells made pakka?—I cannot say one way or the ather.
- 91. Q. In your printed note you say that laud deteriorates unless well manured, do you speak from experience?—Yes.
- 92. Q. Do you refer to canal irrigation ?- I have irrigated land from the Gokak canal, from wells and from the unlialis.
- 93. Q. Did you not use enough of menure?—I knaw that the laud deteriorates unless menured; so I ulways nae manure. These who do not do so, do not get such good crops as mino.
- 94. Q. It is not a question of crop it lis a question of soil, why do you say the land cannot be irrigated without heing manored?—I let some of my lands ut times and the tenunts put manure on it for two or three yeare and get good crops; in the year in which the lense expires they do not manure the land, and an inferior crop is the result. They do this in order so that I shall not get the benefit of his manure.
- 95. Q. And vory sensible men too. I understand that the crops will full aff if the munure is not renewed. That is all you mean by land deteriorating without manure?—Yes.
- 96. Q. (Mr. Higham.)—Sopposing a piece of laud will give a certain yield without manure, will it yield less than that if you go on irrigating without using manure?—The land will yield less and less unless manured. If irrigated by n well n crop could be got with very little manure for two or three years, but after that more manure will be required.
- 97. Q. (Mr. 1 Ibbe'son.)—Can you grow rabi crops in our taluka without irrigation in ordinary years?—Tho rabi erops ure irrigated.
- 98. Q. In black soil do the people water juari?—Yes, but it is not a paying orop, except when used for fodder in had years.
- 99. Q. Would they irrigate wheat in a good year?-
- 100. Q Is all the water of the Gokuk caual used every year?—Yes, there is always a greater demand than it can meet.
- 101. Q. Does it never run dry?-Last year, or the year before it ran dry for the first time since 1896-27.
- 102. Q. (The President.)—Does the Gokak anal come into Bijapur?—No, it does not come into Bijapur, but the Superintending Engineer says the canal could be brought into Bijapur were it not that it would buve to come through the Nutive States of Mudhol and Jamkhandi.
- 103. Q. (Mr. Ibbetson).—Did the water-supply in the wells fall in 1896-07?—No, but there was a deficiency.
  104. Q. Yon had good rains in 1898-99, how did they behave in 1899-1900. Did they fail?—They did not fail mach in 1899-1900. In 1900-1901 was the crisis.
- 105. Q. Last year when they were at their worst, what proportion of the normal area did they irrigate?—Not more than one-fourth. They did well for the first year, pretty well in the eccond and failed in the third.
- 106. Q. You etuto that the dspth of the black soil in your taluka is three feet. What is there underneath it?-Muram or enud.
- 107. Q. Yon propose that in giving takavi we should remit the interest for first two years; when is the first instalment takeu?—Twelve months after the money is advauced.
- 108. Q. How long does a man toke to make u well?—It takes a long time, as the cultivator must wait for the hot weather to test the supply before huilding the well. Only ufter he is satisfied does the cultivator construct the well finally. It takes mother year for him to lovel his land fically. It takes und altogether two years.
- 109. Q. He trice it first as a kacheha well ?-
- 110. Q. Then you hegin to recover before the well is ready to be worked ? Yes.
- 111. Q Do you think that wise ?—No. The first re-covery might be made later—after two years.
- 112 Q. Is any rice grown in your taluka?-Oo'y a small quantity.

113. Q. Speaking of channels from the uallahs, you say that it would be o good thing to encoorage the people to make them; but that there is the difficulty of baving to take them across other people's lands. If that difficulty could be overcome would the digging of channels be taken up?—Thore are some people who would do so.

114. Q. Have you ever been osked by the people to take up land for this purpose?—No.

115. Q. If they dig channels whot would they bave to pay for the water?—If the water is perennial the rate will be Rs. 4 or lts. 5, if it is only monsoon water the rate will be Rs. 3.

be Rs. 3.

116. Q. Supposing Government were to say this is an insecure tract, the water is running to waste, we want to get the water used and we will give the water for nothing; would many of the people take it on these terms?—Yes, if there were no charge for water; mony people would very willingly make channels. muke channels

117. Q. Is there a good doal of room for that kied of work in your talaka?—Yes, u good deal could be done.

118. Q. What area could be irrigated if that were doac?

—Ahout 100 to 200 acres could be irrigated—there are only

two nallahs.

119. Q. In your note you say:—"The increase in the total value of the produce per core due to irrigation is estimated to be Rs. 3, both in a year of drought as well os in a normal year," Rs. 3 must surely be a misprint, ought not the figure to be more than that !—I would like to referred the opicional its must be Rs. 19. refer to the original, it must be Rs. 18.

refer to the original, it must be Rs. 18.

120. Q. Supposing one man has on acro of dry crop and onother has o well and grows an acro of vegetable, would not the difference be more than Rs. 13 per acro?—As regards my own land irrigated by the Gokak canal I can say. If I sow sugarance I should have to spend Rs. 150 and would get Rs. 100 profit, if I sow other crops such as moize, etc., I should get Rs. 50.

121. Q. Sapposing you had no irrigation?—In that caso

121. Q. Sapposing you had no irrigation?—In that ease on the same land T would get Rs. 10 to Rs. 25, 122. Q. (Mr. Mair-Mackenzie).—Have you had any experience of tals on your lands?—Yes there are tals on my land.

123. Q. Do you think there is much scope in your talaka for work of this kind?—Every cultivator with means makes tals. I am sure if cultivators bad the money they would do eo.

124. Q. Have you ever given takavi for tale?—Yes.
125. Q. In some parts of Bijapur tale are preferable to wells, are they not?—Yes, I know that in one case Rs. 1,000 to Rs. 1,500 has been spont in a tale and spent profitably.
126. Q. Are not tale faced with stone?—No stones are

required, stones are only used or required when making sluices for big tals.

127. Q. Have you not seen the onds of the terraces mode with stone?—No, but the waste weir might with advantage

be made of stone.

128. Q. Have you not seen big tāts made of stone work?—No.

werk?—No.

129. Q. You say that in some parts of the district they ore more effective than wells?—Yes, when talls are put across a unlish they must leave it for three or four years before being used to allow the land silt up. After three or four years rice could be grown.

180. Q. Iu your taluka they don't grow rice?—Yes, they

do.
181. Q. And juari?—Rice is more profitable than juari.
182. Q. You mean that for two or three years you will grow juari under the tall your ultimate aim hoing to grow rice?—Yes.

rice f-Yes.

133. Q. Woald lands under a tāl produce goed erops in a famine year ?—Yes, they would produce goed erops even in a year of famine when other lands would not be yielding a crop. Three years ego I put up a tāl aod it was washed oway but I repaired. There was o failure last year, but the four acres which bad the advantage of the occumulation of water under the tāl yielded a first class crop.

131. Q. (Mr. Rujaratna Mdlr).—In this tāl land if you grow paddy, is the assessurent enhanced?—No, it will not be enhanced till the next revenue settloment.

135. Q. Chu the classification of the seil be altered?—

195 Q. Can the classification of the seil be altered?— The classification can be altered, but it is not altered if the improvements are made by owners at their own cost.

WITNESS No. 72 .- MR. IBRAHIM AHMADI, L.C.E., F.R.I.B.A., Executive Engineer, Bijapur District.

Answers to printed memo. of questions.

## I. Para. 3 of Memo.

Experience as regards black soil.—Small tanks constructed in black soil do hold water. Only small dams of about 12 feet high or a little over can be made of black soil without massnry core walls, provided the top and outer slopes are protected by muaum and the inner by pitching. In the second class tanks in this district water is being withing correct or a process rainfall gapagethy. utilised even during seasons of average rainfoll generally for tice and vegetable. I have no information avoilable for the next sentence. I believe there is a desire for irrigation works in black soil, and construction of tanks in such soils would be us remunerative as for other classes of soil.

## 2. Para. 4 of Memo.

Description of existing Government irrigation works.—There is one first class tank, viz., the Muchkundi Tank and 16 second class tunks in this district, the irrigoting capacity of which and range of variation together with all other information for these as well as for works proposed have been collected by Mr. Beale, the Superintending Engineer on special duty, and all questions on these points will be answered by him. None of these works can be de-- pended on in a season of drought.

## 3. Para. 9 of Meme.

Classification of works on which relief labour was employed in this district during the famine of 1899-1900, 1900-1901 and the current year and the amount expended on each class :

4	AMOUNT EXPENDED.								
Class of work.	1899-1900.	1900-1901.	1901-1902 up to the end of Sep- tember 1901.						
Roads Notal-breaking Irrigation work	Rs. 33,460 -26,725	Rs. 64,378 2,19,855	Re. 93,890 33,104 1,66,987						

A small amount was also spont by the Civil Department on village tanks end by the Bijopur Mnaicipality in clearing out wells in the tewn.

Works uncompleted at end of famine.—As regards roads constructed during famine, no forther expenditure in completing them used he incurred. Excepting where pakka cross drainage works are necessary, the reads are finished in all respects. Portious of the roads not touched are not of sufficient importance to warrant further expenditure from Previncial or Imperial Funds. As regards irrigation works, all information required in this paragraph will be submitted by Mr. Beale. submitted by Mr. Bcale.

## 4. Para. 12 of Memo.

Statistical information for the Muchkundi Tank :-

## I .- Initial Statistics.

Area and nature of oatchment-26 square miles, partly hilly and partly black seil.

Assumed overage rainfall-23.50 inches.

Full supply capacity of tank in million c. ft.-624.

(The capacity originally proposed was 302 million c. ft., the present increuse being due to the dam having been made tee high for reasons of construction.)

Percentage of capacity on assumed average minfall—42.32. (Originally proposed—21.18.)

Water spread at full supply-44-18 million sq. ft. Maximum height und total length of dam :-

> Height 60 ft. 421 ft. Leagth

Cost of-

Rs. Dam 67,014 Waste weir 5.105 2,172 Sluices Compensation for land submerged by 13,478 tank Cost of canal and distributing channels. 18.874 Total capital cost 1,58,707

Mr. Betiveri. 6 Jon. 02.

Mr.

Ahmadi.

6 Jan. 02.

All available initial statistics for new projects will be submitted by Mr. Boale.

- 1. Q. (The President).—You ore Excentive Engineer, Bijapur ?—Yes,
- 2. Q. How long hove you been here?—For four years. I have all the local works in my charge.
- 3. Q. I suppose that there is so little irrigation in tho district that you have not hestowed much attention to the sahject of irrigation?—That is so.
- 4. Q. You have the Muchkundi and Sangegi works under your care?—Yes; I am looking after them, the latter is a famins work and is under coostraction.
- 5. Q. You have heard wont the last witness said about hlack cotton soil taking irrigation feeely is that your experience ?—I cannot say; I have no experience.
- 6. Q. Why is the Muchknodi tank not doing better?— The dam is too high and it never fills. People wont a guarantee that they will be given a sufficient and permanent supply.
- 7. Q. The people don't ask for that gnarantee elsewhere P-No.
- 8. Q. Is the tank badly made?-No, the tonk is well made.
- 9. Q. Is all the available water used ?-No, the water is not all used.
- 10. Q. (Mr. Ibbetson).—Not even in a famiue year ?—No, not even in a famiao year.
- 11. Q. (The President) .- What is the cause !- The excuse is that they are not suro of getting water always.
- 12. Q. (Mr. Higham).—Why should they not irrigate rab; they would know how much water there was at the end of the rains?—I do not know why they do not do
- 13. Q. (The President).—What do they grow ?—Sugarone and garden crops.
- 14. Q. Do you not think there must be some reason heyond that which you have given; are the rates too high?—I have never heard any complaint about the rates high?—I h
- 15. Q. When was this tank finished ?-It was finished before I came here.
- 16. Q. (Mr. Ibbelson).- Is the water rate for rabi crops prohibitive?—No; but some two years ago I went to Bagal-ket and had a conference with the enlitimtors when they demanded a guarantee are also made a proposal which I have montioned in my note in Mr Bealo's book. They said also that they feared that the rerenue would be inoreosed if they irrigated high class crops.
- 17. Q. (The President).—Don't you think there must be something in the back ground that we do not knew about f-l cannot say.

#### 5. Para. 13 of Memo.

Scale of water-rates.—On Mnohknudi Tank, which is a minor work the charges ere Rs. 8 for perennial, Rs. 4 for eight menths, Rs. 2 for four months, Re. 1 for mensoon dry and Rs. 4 for special hot weather crop per acre. Application for water is received during the whole year. There is very little irrigation under this tank. A knrkun, who is paid Rs. 5 per menth for the work, looks to the distributioe. During years of favoorable rainfall there has been less demand for irrigation under the Muchkandi Tank. Second class tanks ore always empty at the end of irrigating season, i.s., in hot weather. The only new tank constructed during recent years is the Mnohkandi Tank, the irrigation from which has hardly affected the revenue derived from lands under it. Maintenance charges for Mnehkundi from lands under it. Maiatenance charges for Muchkundi Touk are fair. As regards second class tanks, they are only repaired if the rayats contribute 10 per cont. of the cost. The maintenance charges for these tenks are also fair. No rovenue accounts are kept for second class tanks and the irrigation operation of the Muchkundi Tank in too small to acswer the last sentence of this paragraph.

#### 6. Para. 14 of Memo.

Protective value of irrigation works.—Alushkundi Tank is the only protective irrigation work in this district. The areas irrigated under this tank are given in reply, to paragraph 12. This tank hardly yet protects any area, and its existence makes no difference in the extent of femioe relief operations of this district.

- 18. Q. (Mr. Muir-Mackenzic.)—They wanted o guaron-tee; what would have happened if the water failed?—I coold not be sure of the water-supply in the tanks and so could not give the guarontee, if the water, failed the culti-vators would have come down on us for damages.
- 10. Q. (Mr. Ibbelson.)—I can understand the offitude of the people in an ordinary year, but what obout a fumine year?—The people have taken more water during the last two years of famine.
- 20. Q. Whan was it that you made the engoiries you refer to; was it before the famine or after it?—After the 1896-27 famine.
- 21. Q. (The President.)—In 1891 and 1892 I notice from the toble in your note that the people began well ?—Yes, that is the highest area on record.
- 23. Q. The next year the area wont down to three acres?
- 23. Q. (Mr. Muir-Mockenzie.)—What was the soil commanded?—A good deal of the coll is black roll.
- The President then read the following note by Mr. Ahmadi from page 48 of the Report on Irrigation Works, Bombay, 1901: -
- Rombay, 1001:—

  "While I was at Bagalkot, the Momlatdor was good essugh, at my request, to invite all the prinsipal enlitraters under the Muchkundi Tank to meet me. Most of them came, and a long conference cosned daring which it transprired that the oultivators did ast care to make asso of the water for temperary crops such as rabi and kharif, as they say that the expense and trouble is not sufficiently compensated. It appeared to me that being unaccustomed to artificial irrigation they were not enterprising enough and were quite satisfied with what the raine brought them. Most of them were, however, quite prepared to go in largely for percannil irrigation if they could be certain of a continuous supply, their intention heing to sow plantain, sugarcane, and other paying garden produce. They were deterred, however, by the risk mrelved. They told me that it oost about Re. 200 per nero to propore land for a plantation of the above nature and it began to yield profit ofter two years' labour at the rate of Rs. 100 per use per annual II daring the interval the water-amply failed the trouble and expense incurred would be entirely lost. After a good deal of conversation some of the cultivators come forword with a proposal to make an experiment with 9 acres of land on the water and the transparent. with a proposal to make an experiment with 9 acres of land on the main canal of the tank and 7 nores on its branch on the main candities, and they drew up a statement in vernaeniar which I submit in original. The conditions in effect are that on the lands proposed water should he supplied continuously for five years and in case of foilore Government cheuth nudertake to indemnify them for the actual less sustained, such loss to be determined by a Pan-chayat in the asual way. If this proposal is at all seriously entertained, an estimate of the does incurred of different

periods by the failure of water may be made by the figures given in the penultimate sentence of the preceding paragraph. Although I cannot eay that the cultivators are unreasonable, yet looking to the condition of the tank I connot possibly recommend the proposal. For even if we are fortunate enough to supply them continuously with water during the gnuranteed five years, there is no certainty that the cultivators will increase or even continue the cultivation after the period without n fresh gunrantee. I am aftaid the cultivators will increase or even continue the cultivation after the period without u fresh guntantee. I am afraid that as long as they eee the water standing in the tauk at the level where it usually does now, they will be requiring a guarantee. I sobmit a statement showing the height and quantity of water since its construction and the area which could have cultivated. It thue has to be concluded, therefore, that as the tauketands there ie not much prospect of extending its irrigation, for us stated above the cultivators will not take the water available for temporary irrigation which they want, we use not will not take the water available for temporary irrigation and for continious irrigation which they want, we ure not in position to g narantee u snpply. Thus we have to full hack upon ways and means for improving the supply of the tank. The only practicable scheme proposed in this connection is the extension of the catchment urea of the tank by diverting the Hungargi Nulu into it. This matter was finally disposed of with the correspondence ending with this office letter No. 3554 of the 5th November 1898. I um, however, not eatiefied that all possible lines for the feed channel have been fully investigated. But further investigation is landly possible without a contour survey as suggation is hardly possible without a contour survey as suggested by me at the end of this office letter No. 1310 of 24th March 1898. If this is done, it is just possible that a line may be found for a broad feed-channel with a low dam across the nale giving a very desirable sort of work as a famine project."

- 24. Q. (The President.)—There is, I notice, a project for u feeder from the tank?—Yes, only trial lines have been made so far but the results are pronounced to be discourag-
- 25. Q. What river does the tank depend on f.—The water is taken from the Muchkundi und bas no communication with the ghats.
- 26. Q. Can you suggest uny means by which the tank could be made more useful?—The only scheme is to take water from the Hangargi nala. A dam and canal were proposed but it promised to prove very expansive as there would have to be a good deal of rock-cutting. The idea was to have a dam as well as a canal but the waste weir would prove very costly. If we could divert the nala it would be good thing.
- 27. Q. Is the nals so large that you could not do that?
  —It would probably not be possible to divert the nals without building a dum.
- 28. Q. Tell me something about the Sangogi and Huloor tanks. What state of progress are they in?—On the Sangogi tank the puddle trouch is nearly completed on the left bank.
- 29. Q. Are there large parties on the work ?-At present there are only small parties. At one time we had 10,000 people at work, now we have only about 2,000.
- 30. Q. You have not done much to the dam ?-No, only the puddlo trenches uro being completed.
- 31. Q. The dam is a very long one, is it not?—Yes, nearly two miles long; the puddle trench is 60 feet deep and the water depth will be 65 feet.
- 32. Q. Of course the work of construction of the waste weir has not been touched?—No.
- 93. Q. Do you think it is desirable to finish this work?-Yes, it should be completed, it is a promising work.
- 84. Q. Would the people take water any more than they do from the Muchkundi?—I do not know.
- 35. Q. What is the state of progress of the Huloer orke?—We are filling in the puddle treueb at Huloer.
- 36. Q. There too you have not done anything to the dam?—No.
- 37. Q. Are these the only relief works you have ?- Yes, as far us tanks are concerned, but we have two other relief works for making roade.
- 88. Q. Are they going on now ?-Yes, previously there
- 39. Q. Would it he possible to transfor people from roads to tanks ?-No tank worke are unpopular, not 10 per cent. of the people would go on them.
- 40. Q. (Mr. Higham.)—Why are they unpopular, are they too far away from the villages ?—I do not know the reason, but I know that they do not like to go on tank worke

- 41. Q. You say that on all second class works in the disworks have you got?—From 14 to 16. I believe that all the water in these tanks ie used. I bave nothing to do with them, the Reveune Department looks after them.
- 42. Q. Have you not to repair them?—Yes, when the rayat contributes 10 per cent. of the cost of repairs.
- 43. Q. Do you keep any revenue account of them?—No, the Public Works Department do not keep any revenue account of tham.
- 44. Q. I suppose the Collector doss ?-Yes, the Collector
- 45. Q. To come back to the subject of the Muchkundi, I do not quite understand why the people will not go to the expense of cultivating percental crops on a work of that kind. Ou almost all tank projects which are laid before us, the conditions are similar to the Muchkundi, they are liable to fail at the end of the season. If you have water left in your tank at the oud of the eenson, how is it that the people do not irrigate rabi crops?—It may he because the people are not accustomed to irrigate in those
- 46. Q. But you suy that they do irrigate on all the ecoud class works?—They do. I cannot account for it.
- 47. Q. Supposing we made this tank over to the people and they were allowed to irrigate without payment of now water rate, and we left them to devolop it themselvee, would they take it for rabi irrigation, that would be putting the Machkundi in the same condition as a second class work?— It would be worth a trial.
- 48. Q. It is not profitable new?-No, it does not pay its working expenses.
- 49. Q. With regard to Sangogi and Huloer our you say what the value of the work done on these two worke is ?-I cannot say offhand.
- 50. Q We have to consider whether it is worth while completing these works. You must have some idea of what has ulready been speut on them?—The Sangogi works ure estimated at 18 lakhe.
- 51. Q. Yes, then what do you think is the value of the work done?—At normal rates I think the work done amounts to 1½ lakhs. There are now 2,000 men employed
- 52. Q. Aro they likely to continue?-Yes, till October next.
- 53. Q. Do you thick 13 lakes near the mark as to the amount already spent or would you like to examine the figures?—I chould like to examine the figures, but I think the figure I have quoted is about right.
- 54. Q. If we assume that the works will cost 18 lakhs, you have done 12th of the work?—Yes.
- 55. Q. What is the value of the work done on the Huloor?—The Huloor is a small work. The estimated cost ie 4 lakbs.
  - 56. Q. Yes.
- 57. Q. You were working on it in 1900?—We commonced the work in 1900.
- 58. Q. What is the value of the work done on that tank? I think at normal rates Rs. 40,000 to Rs. 50,000 or about rut of the estimated coet.
- 59. Q. You might finish thle in the course of another two famlues?-Yes, the Huloor tank might be finished during the course of unother two famines, but the Sangogi tank would take longer.
- 60. Q. What about the land under the dam, hue it been taken up?—The land has been partly taken up.
- 61. Q. Of course the rest will not he taken up till uctually required P-No.
- 62. Q. (Mr. Itbetson.)—Do you know anything about the Nilgundi and Inchgori tanks?—No, they were disposed of before my time.
- 63. Q. (Mr. Rajaratna Mdlr.)—According to your system of application there is no gnarantee that the rayat will get water, and there is no certainty if he gete it this year that he will get it next?—We give ue guarantee.

  64. Q. It is open to you to refess to give water?—Yes.
- 65. Q. Does that act se a deterrent?—The operations so far have been too small to judge from.
- 66. Q. Largo quantities of water are left nuntilised, something like 122 million cubic feet were unutilized in 1901, what area could that have irrigated of garden crop

Ahmadi. 6 Jan. 02.

Mr. Ahmali. 6 Jan. 02 and vegotobles ?-I cannot say without the book. About 600 ocres.

- 67. Q. Supposing the rayats were assured that whose the crops fail the whole assessment will be remitted, will that induce them to take water?—My idea is that the people would not only ask for remission, but for componential as
- 68. Q. So mero remission of asyossmeat will not induce them  $P \longrightarrow No$ .
- 60. Q. Do you see any objection to allowing a certain fixed portion of the holding to be irrigated each year?—I think fixed orem of irrigation might give some one one or any other properties.
- 70. Q. I notice that the receipts from the Muchkundi are shown on Rs. 344, the "Miscellancone" item heing Rs. 232, how is that accounted for ?—The "Miscellancone" revenues are from factories in Bogalkot and from sale of babul pods.

- 71. Q. Are there any wells in the area commanded by this tank?—I am not aware of any wells.
- 72. Q. Are there fecilities for the construction of wells and is it probable that water will be found at a reasonable depth?—I cannot say.
- 73. Q. Would it be a good thing to introduce wells in the vicinity of tanks? -- Yes, I think they might be onconragod.
  - 74. Q. Has this point been considered P-No.
- 75. Q. I suppose owing to the presence of the tank the spring level would be higher?—I think it would be higher, but the spring level would be more than 29 feet below the ground.
- 76. Q. With regard to the two projects you have men tioned—the Saoguei and Hulcor, what srea will they irrigate?—The areas likely to be irrigated under the Sanguei and Hulcor have been given by Mr. Beale in his report as 7,000 and 1,700 acres, respectively.

## TWENTY-EIGHTH DAY.

Bijapur, 7th January 1902.

WITNESS No. 73 .- Ma. J. Mollison, M.R.A.C., Inspector General of Agriculture in India,

Me Note by Witness on possibilities in the Decean of exten-sion of projective Irrigation Works.

7 Jan. 03.

The Deccau and parts of the Southern Mahratia Connirgare in greater med of protection by irrigation against drought than other parts of the Presidency. In my note aiready submitted to the Commission I have discussed at some length the volue of wells in these least protected parts. I am aware that the order injected area in the Reccau Districts in 1900-1901 was less than that of 1890-1900 by mearly 00,000 acres. This is attributable to fullure of water supply, the result of scant rainfall in the more open plains during four or five coarcentive years. Good rainfall during one or two years will again ruen the water-level and the well-brighted area will ugain expand. If proper encouragement is given three will be further expansion.

2. At Surat I suggested to the Commission one means of encouragement. I proposed that Government should offer a premium of Rs. 25 per acre of good crop preclaced in the first year between the 15th of October and the list of May by regular irrigation with sweet water from a paker built well. The total amouat per well should be limited to Rs. 100 where the depth is less than 70 feet and to 18-200 where deep and very co tiy wells are required. Nothing should be given for shallow wells with depth to water less than 18 fiet.

3. I would post a actice signed by the Collector in overy The Decean and parts of the Southern Mahratia Connirg

than 18 feet.

than 18 feet.

3. I would post a notice signed by the Collector in overy village in the unprotected ports of Gujarat, the Deceau and the Southern Mahrotta Conaty stating that the object of offering the prominm is to encourage the construction of wells in all favourable positions, so that there would be a means at hand for pradacing tood for the people and their cattle in partions of all villages in funine years or in years of scant rainfall, and also of proriding in these evisions remunerative work for some of least of the people. In the same notice, in order to allow suspicion of interior motives an absolute pledge should be given that Government will not at any time raise the assessment on well-irrighted lands. not at any time raise the assessment on well-irrigated lands in any greater degree then on similarly assessed dry crop lands. The premium which I recommend should pass directly from the hands of the Collector or one of his Assis-

directly from the hands of the Collector or one of his Assistants to the hands of the owner of the well.

4 In the noprotected puts of the Decem I do not expect to see any very nosterial increase of protection by new camb or large tank projects worked by the State. The supplies of water for existing emals can no doubt be increased by additional expenditure for storage. The December of the december of the projects of canal arrigation and such irrigation is not at present to any great extent protective for various reasons. The chief 122-023 are—

(1) that the surface of the December 13.

(1) that the surface of the Decem is rolling and irregular, and the soils which are specially suitable for irrigation except in open plans for from catchment areas occur to a large extent in natches

(ii) that in order to command these palolies the course of a canal near its head work must be exceed-ingly torthous. The canal must to a consider-

ingly tortuous. The ensol must to n considerable extent be constructed through upland, light soil, muram and, hard trop. The prime cost must, therefore, he large and the wasle in leakage from the canal itself will be very great;

(iii) that the distributing water channels have often to be made long distances through light soil which is unsuitable for regular originion. As much water may look from the distributing channels as reaches a field if it is a small isolated area of a few acres only;

(iv) that in years of diought existing chants fail to supply, when most urgently needed, safficient water for the area of crops ordinarily commanded by them;

water for the area of crops ordinarily com-manded by them;

(r) that they are worked more for revenue than as protective works. Intensive percentlal irriga-tion paying high rates on comparatively small area is encouraged. Water-logging to a serious extent has thereby been produced. It will get worse unless drainage is arranged for or a radical change made in the system of irrigation. The intensive sextem of irrigation above referred to

5. The intensive system of irrigation above referred to has produced extraordinary valuable copy of sugarcance in the Poona District. A class of speculator landledge rother than boud fide cultivators has been thereby enriched. Land of good class commanded by the canal has become exceedingly valuable. Latake it that it was not the intensitient of the product of the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal based on the canal b tian of Government that a rank designed as a productive work should be the means of enriching land-owners who are

tian of Government that a casal designed as a productive work should be the means of enriching land-owners who are not themselves entitivators and who, when the pinch of famine comes, accept little or no responsibility in providing food or work for starving people. This landled class of people has been largely benefited by the Kharakwasla Canal and possibly also by the Nira Canal.

6. In eacouraging the intensive system of canal irrigation above roterred to, the irrigation officer pledges himself murally, if not actually, to give canol water throughout the year for the more valuable perennial crops which pay high rates. In a year of drought this pledge maker it impossible forhim to give, to may considerable extent, where sufficient water for irrigation in the hot weather in the following year. He will freely admit that it does not pay to give, at the ordinary rates, canal water to save a withering bharif crop. An enormous amount of water is cirtainly absorbed in the first watering by black coil which has dried and cracked. The owner of a kharif crop in a year of drought wants water however before the soil gets to this slage of drynces. He is prevented from getting water at the right time because a permit is necessary. He does not nayly for a permit until he sees signs of his crop witheriag. He does not usually got it until his crop is patearing. During the last five years canal water has been used

repeatedly to help or save withering kharif crops on the Government Farm at Kirkee. In the 1899 finaine year three wateringe were found accessary. The first watering was get in time. Formal sauction was afterwards obtained. An ordinary sultivator could not so easily have arranged with the Irrigation Department in sufficient time to save his The actual outturn of grain and foulder at the Kirkee Farm from the irrigated crep referred to compared favour-ably with that of ordinary years and ewing to high market-rates was worth about double as much as asual.

- 7. A cultivator knows perfectly well how valuable equal water would be in a year of drought in saving a crop which would otherwise wither; but if he is to take advantage would otherwise wither; but if he is to take advantage there must be no obstacles pat in the may of his getting the water in time. I should therefore make him free to take the water dering the kharif season without a day's delay when he wants it if it is ranning in the canal. I should sulegnard the Irrigation Department as regards water-rates by compelling the oultivator under penalty to give information regarding his requirements on the date he begins to irrigate. He will not take water unless he urgently needs it. The expense of leading water over uneven land with no system of beds is considerable and the water-rate has to be vaid. water-rate has to be paid.
- 8. I confidently believe that the Kharakwasha and Nira 8. I confidently believe that the Khamkwash and Nira Canals which are the mest important irrigation works in the Deecan, would be much more protective than they are and would irrigate much larger areas than they do (a) if less water was saved for irrigation of psreamial crops hotween the let April and the break of the next mensoon; (b) if more water was used during drought for khurif crops; (c) if free scene is given for the irrigation of food grein and other crops between the middle of October and the let of April. I believe that higher rates than these now charged for kharif and rabi irrigation would be quite justified. But in any case until experience and results are obtained, the question of revenue should be made enberdinate to that of scenrity uguiust famine. that of security uguinst famine.
- 9. I am entirely against irrigation officers pledging thamselves either morally or actually to give canal water for perennial crops between the let of April and the beginning of the rains in any year. I would rather be inclined to issue a year's notice to the present sugarcane growers and others to the effect that the Irrigation Department cannot grar-antee in any year a supply of canal water for perennial crops between the 1st of April and the break of a favourable
- 10. Within recent years many of the sugarance crops grown under caual brigation in the Poona Districts have been exceedingly valuable and the superior helders or

- eccupants of the land thus irrigated can very well afford Mr. to construct wells to irrigate their crop in the hot weather. J. Mollison. The chances of getting water at reasonable depth are pretty certain and the wells if constructed will be a great safegaard during season of scant rainfall and will in all seasons be a mataul help to the canale.
- 11. Mr. Visvesvaraya has explained to me the bleek system of irrigation which he has proposed for canals in his charge. The system would in my opinion set excellently if he can get village communities to choose their areas, if each village community regulates the distribution of the water equally to the village block and if perennial irrigation is restricted.
- 12. I do not think small tanks in the open plains of the Decean will be of much ase. They will not fill except in years of exceptional ruinfall and even if full in the mins years of exceptional rainfall and even if full in the rains they will not held water long during the fair season. Mr. Visvesvaraya proposes to have storage tanks along the course of a causi to be filled as required from the canal. The proposed is, I think, cound and could be made to fit in with his proposed block system of irrigation. Leakage from such tanks would help well irrigation. But it is very difficult to see how water rates no to be arranged for this mutual support system unless a village community agree to pay a lump sum for a term of years for the irrigation advantages received. The community could apportion among thomselves the amount which each eccupant should pay. Theoretically there are great pessibilities, but I do not quite see how it is all to work out emosthy in actual practices. practics.
- 13. There is great seeps for extension of irrigation by pat from bandharas throughout the Decean. Extension of well and pat irrigation should be encouraged together. A well and pat irrigation should be encouraged together. A complete survey regarding possibilities is required. Only practical experienced officers who can consult the people as to their requirements should be put in charge of such survey. The surveyor will determine where pat irrigation is practicable without infringing on down stream rights. Having determined this point, village communities should be encouraged to undertake the work themselves. No charge for the water should be made for a term of 5 to 10 years. Afterwards a very medicate lump sum for each handlesses. Afterwards a very mederate limp sum for each bandhura should be charged. The people can make their ewn arrangement regarding apportionment. Government should also give an absolute pledge that the assessment of pat irrigated lands will at no time be raised higher than similarly assessed dry orop land.
- 14. I helieve that if the people are encouraged to construct wells and bandkaras throughout the Decan in the manner I have sketched a very full measure of protection against famine will be reached in a very few years.
- 1. Q. (The President.)—We have received your paper and I have read it with a great deal of interest. I gather from it that you think the best means of protecting the country sgainst famine is by wells and bandharas?—Preoisely.
- 2. Q. Although it is a recognised fact that in times of 2. Q. Although it is a recognised fact that in times of prolonged drought the water in wells goes down considerably f—It certainly goes down, but I imagine that canalirrigation would go down to the same extent or even more. During the past 5 or 6 years, a worse condition of affaire has been experienced than usual. There have been a succession of famines since 1896-1897, and not rithstanding that fact the wells have done computatively well.
- 3. Q. You believe irrigation from canals has gone down equally !-- Yes.
- 4. Q. Tuke the Nira canal; has that gone down?-No. but the circumstances there are exceptional.
- 5. Q. What makes you say so !—The conditions on the Nira are most favourable. It is led away from a catchment valley in the Ghats straight to land most favourable for irrigation.
- 6. Q. Is it the only valley of the sert available?—You could get land as favourable for irrigation in the open plains of Ahmadungar, Shelapore and the Senthern Maratha country where similar conditions might develop, but not, in may judgment, so near the entchment area.
- 7. Q. You would have your cand leaking so that when you reached a good spot your water would be all gone?—That is an engineering question. I would like to see a thorough survey made.
- 8. Q. (Mr. Ibbetsen.)—The loss of water that you refer to would be the same in all years, why should canal

- irrigation decrease in famine years?—The head-works would not fill in a famine year. The depth to water in a well is not much greater in a first famine year than in an ordinary year, and it is not much worse them an ordinary year in a second famine year: the supply of water in a well is safer than a supply of water in a canal.
- 9. Q. (The President).—Is not the snpply of water equally good in the Ghats?—In the Ghats eatehments you get min probably in a famine year, but even with this safeguard canals are not so protective as wells. On the Mutha Canal in the Kharif season a good deal of water raus to waste in ordinary seasons. If good rain senses in October the people freely apply for water for sugarcane; if the late rains are deficient such applications are not freely made. deficient such applications are not freely made.
- 10. Q. That is, they muticipate that there will be a decrease in the canal supply. May it not be that there will be a decrease in the canal supply. May it not be that there will he a greater demand for other crops?—Thay know it by experience. Cane is planted between Documber and the February following and when the cultivator knows positively that the canal water-supply is sufficient he is keen to apply for water for caue. If there is deficient supply no cane is grown.
- 11. Q. (The President.)—May not the bad supply for cano arise from the greater domand for other orops rather than from a less actual supply of water. Porhaps Mr. Benle can tell ns.
- Alr. Beale.—The Kharakwash always fails; but irriga-tion in the het weather depends on the balancs in the tnak and that depends on the late rains; if these are good less water is used for rabi and there is more to spare in the het
- 12. Q. (The President.)—In paragraphs 2 and 3 you suggest a plan for encouraging well irrigation by giving

Mr. preminms on good orops. Would it not answer the purpose J. Mollison, equally woll to give money for wells?—If no interest is charged much cusourgement would result.

- 7 Jan. 02.
- 18. Q. In paragraph 4 you say, "The Decam, generally lands itself unfavourably to any lerge system of canal irrigation and such irrigation is not at prosent to any great extent protective for various reasons." Then you go on to give five reasons for it. All those objections are financial. It would oost more to got the water on to the land?—It is a question of cost per unit of supply. There are no physical impossibilities.
- 14. Q. You mean that there are no physical impossibilities, but that it is merely a question of whether it will pay?—It is only a matter of money.
- 15. Q. (Mr. Higham.)—You think the money could be spant better in another way?—Yes, I think if the money were spent on wells it would go further. Canels cost Rs. 200 an aere Irrigated. We could do a good deal with that cepitel in extending well irrigation and do more good.
- 16. Q. (The President.)—Then you mean to say that the canels are worked more for revouse than as public works. That is en edministrative metter, G overnment might arrange thair working as it pleases. I mean it is in the power of Gororument to sey that the onnal must be worked in this way or that?—Yes, but dofinite orders one way or the other should be issued to the Canal officers.
- 17. Q. You say "a oultivator knows perfectly well how valuable canal water would be in a year of drought in saving a crop which might otherwise wither. I should, therefore, make it free to him to water during the kharif season without a moment's delay." Would be not understand that water could be taken when necessary? I thought that Mr. Vishweshwaraya told us the application in the monsoon was done away with?—Water is not given without application. Proposals have been made to give definite supplies of water for particular hlocks of land in particular villages. Mr. Visvosvaraya has proposad, I believe, some guch system.
- Mr. Ibbetson. Yes, but I believe the ralaxation is limited.
- The President.—That again, of course, is not a matter inherent in the canel. It is a question of administration.
- 18. Q. I do not quite undorstand Mr. Visvesvaraya's "block" systom; can you tell as something about it?—He proposes to guarantee water to 200 or 300 acros per village and restrict the irrigation of perennial crops in those areas so that a good deal of water will be available for rabi crops.
- 19. Q. Then, does he propose that the village should confine itself to irrigate this area?—He calculates how much water he can dispense and distributes the water muong certain villages; he leaves the cultivators free to divide the water among themselves. He thinks in that way the cultivators will make better use of the water.
- 20. Q. But he takes it upon himself to say how far the water should go. He does not leave it to the cultivator f—He believes that this system will economise the water.
- 21. Q. Yes, hut supposing n cultivator under this system had water for 10 seres guarantsed to him, would he let him distribute it over 16 neres if he wished to do so?—Ho gives the village n certain quantity of water and leaves it to the oultivators to distribute the water among thomselvos. He has no objection to their using the water on an increased near.
- 22. Q. You say, "I do not think that smell tanks in the open plains of the Deccan will be of much use. They will not fill in the rains except in yours of exceptional rainfall, and even if full in the rains they will not hold water long in the fairseason." Is that so in Gujerst also?—That does not apply to Gujarst but to the Deccan, where there is excessive lenkage through muram end trap.
- 23. Q. (Mr. Ibbetson.)—The rainfull in the Decean is small and uncertain?—Yos, scantier and more uncertain than in Gujarut.
- 24. Q. (The President.)—Then you go on to the question of bandharas irrigation. You presume in thet ease that there is water in the rivers ?—I know that there is water in the streems which could be utilized.
- 25. Q. Has the Government opposed the use of water from the bandharas?—The Government has opposed it in a sense, heense if the oultivator takes the water he hes got to pny for it. I would do eway with the whole system of cherging for the use of water from nallaks and sub-soil water overywhere.

- 28. Q. It comes to this.—You think that it belongs to the riversin population and not to the population at large?—You give it free for men and cettle to drink and you refuse it to the thirsty lead. I would only charge where Government incours the cost of the bandharas.
- 27. Q. (Mr. Ibbetson.) —In the Decom only or everywhere?—Everywhere.
- 28. Q. (The President.)—You sey "I believe that if the people are encouraged to construct wells and bandharas throughout the Decenu, in the numer I have skotched, a very full measure of protection manner I have skotched, a very few years". If that wore corried out to the fullest extent could you give any idea as to the amount of cultivated crops we might expect to see under irrigation in a bad year?—The present area under bandharas is trivinl; the well irrigated area is about 700,000 nores. It might in time be doubled.
- 29. Q. But the culturable area of the Deccau is 20,000,000 agree ?—Ninety per cent. of the oulturable area is ansuitable for irrigation. There ore many uplands where the soil is too thin and rocky.
- 30. Q. (Mr. Ibbetson.)—Too rolling?—Yes. I won't sommit mysolf to 90 per cent. If you have 1\{\} millions of acres under wells this would be the pick of the land of the Deccan and the difference of outturn will be considerable. We would be concentrating our offerts on the best part of the country—the pick of the land—which will produse \(\frac{4}{2}\) to 0 times as much as poor suil even without water; add water and you would still further increase this.
- 31. Q. Would you not store water?—Yes, canals from atered water would help well irrigation by keaping up the water level. In the ease of a bandhara with a little storage a man would probably protect himself further by building a well.
- 32. Q. Woold you store the water that fulls in the hills every year or would you lot it flow away?—That is an ongineering question. The Engineers can decide whether storage is required. I have not the experience to offer an opinion.
- 33. Q. (Mr. Higham.)—I understand that you deprocats canni irrigation in the Decean P.—Yes, I prefer well to canni irrigation and preferably would like to see well irrigation extended.
- 34. Q. Although you have an enormous rainfall in the Ghats, no efforts have been made to utilize it for irrigation in the Decom?—You would do quite as much good by spending the money that it would cost to bring the water down, in making wells.
- 35. Q. Have you worked it out in any way?—Yes, I think well irrigation is cheaper. A coool cests Rs. 200 an acre and that amount would go a long way in extending irrigation by wells.
- 36. Q. How many neres would you irrigate for the Re 200 applied to the construction of a well P—A Deceau well working 2 mots would irrigate 6 or 7, acres and would cost from Rs. 300 to Rs. 400.
- 37. Q. (The President.)—In Sholupur we were told that wells cost a good deal more than that.
- 38. Q. (Mr. Thbetson.)—You refor to a kachcha well ?— A kachcha well in the Deceau is huilt so well that the sum necessary to complete it is not a great deal.
- 39. Q. (Mr. Muir-Mackenzie.)—Would you say that euch a well would last for an indefinite period?—Kachcha wells in Gujarat fall in with rain, but in the Deccau whose the hase is rock, it only requires massury built up on one side for the mot, and a well so constructed may last indefinitely.
- 40. Q. What is the eren in the whola of the Descau which could be protected by wells?—At present the meximum arm is 700,000, hat I should be extremely glad to see the present aree doubled. 140,000 acres is the limit of possibility in my opinion.
- 41. Q. (Mr. Ibbetson.)—The present area is only about 2 per cent, of the Decean?—I should say not more than 2 or 2; per cent.
- 42. Q. (Mr. Higham.)—If you double that it gives only 5 per cent.; that wou't keep famius off—The land thus irrigated from walls would be the best land and would give an outturn of great value in a famine year, and very valuable erops in ordinary years.
- 43. Q. What about the other lands ?—The outturn from the uplauds on an average is extremely poor.

- 41. Q. In order to get more than 5 per cent. something more will have to be done. Wells will not afford full protection, what else do you propose?—I have no objection to canals so long es you do not mind the cost and regulate the distribution so as not in damage the land. A lot of land irrigated by the canals in Poona is going out of onlivation, because it gets excessive irrigation. Give a man a well and you will find that his land will not go out of cultivation.
- 45. Q. Why do you limit the possibilities of wells to 1,400,000 acres P—The area of low-lying lands with 2 to 4 feet of black coil nud muram bolow limits the increase. I don't think invourable positions for wells other than these can be found. You can put too many wells together in a small area, one well drawing on the enpply of another. They must be distributed.
- 46. Q. (The President.)—How far appart should they be P Would you say 10 acros to a well P—I think that two wells in the most favourable positions might be put in 10 acres, but it depends on the slope and the catchment. In Junnar and Khed (Poona District) two wells in 10 acres would be marked to such perfectly snfo.
- 47. Q. (Mr. Higham.)—You are afraid that wherever canol irrigation is introduced the result will be the growth of perennial crops by wealthy expitalists and not much protection in the population generally ?—That depends on the nrders of Government. If left to the Irrigation Department us nt present, I don't think there is any likelihood of a chaoge in the system. They attempt to work the canal more for revenue than for protection.
- 48. Q. The Nira Canol is not worked for revonne; the percentage of cane cultivation is only 8 per cent.?-It will extend as the mon gat richer.
- 49. Q. It is kept down artificially by conserving the water for rabi crops ?- It is left to the option of the controlling officer.
- 50. Q. Surely an acro of cano irrigation has great pro 60. Q. Surely an acro of cano irrigation has great protective value, whether in the hands of capitalist or cultivator, than an occe of dry crop. Supposing you had lots of manure, could you increase the area?—I showed you at Manjhri the extreme limit to which cano cultivation can be got with suitable soil, manure, and water. It is possible to get segarcane crops under favourable conditions worth Rs. 1,000 per acro which would give 12,000 or 12,000 before. 18,000 lbs of gur.
- 51. Q. How much of that is the value of manure?-Its. 200 an acro.
- 52. Q. The purchase of that manure must maintain a good many people?—Yes.
- 53. Q. So that altogether an acro of cane will main-53. Q. So that attogether an acro of caue will maintain 4 or 5 more people than an acre of juart?—Yes, but for perennial irrigation it is required that a good deal of water should be stored up so that water can be given in the hot weather. That makes it impossible for irrigation to be given freely in the menesou. Therefore, in a year of draught the crops in that particular year absolutely wither, because a pledge has been given by the Irrigation Officer for a portion of the water nine months alread.
- 54. Q. That would not be so if the cane crop was limited to a certain area?—The limit I propose is that there richer capitalists who grow sugarcane should be given water from the canal only if they have a well. If they can slived to buy manure and can affired the other expenses necessary for growing a good crop of cano they can equally well afford to dig their own wells.
- 55. Q. Supposing you made a condition that before cauctioning percential crop irrigation in any holding a well should be constructed, would that prevent the full utilization of canal water in the case of a new area?—I do not think that in the engarcane area of Poona it would have any deterring effect, but with new areas it would have any description of the area of the conditions of the conditions. limit the utilization of the caual supply.
- 56. Q. I am not speaking of a deterring effect. If he roode his well we should not reserve water for him in the hot months?—That is all very well now, but suppose we had a new work and you said I will not give water unless you have a well; the man might not grow sugnressed at all.
- 57. Q. From your point of view that is what you want?
  —What I object to is that so much water is taken up in a
  year of drught and not given to ordinary food-grain
- 58. Q. The only practical remedy for that seems to be to have no canals at all or to say that permanial arrops must be partially protected by wells?—I have ne objection to that.

- 59. Q. You think that in a new work ne one would ge in for irrigation ou those conditions ?—Yee, but in the case J. Mollison. nf established works the men being capitalists they can afford in build a well in order to continue this profitable 7 Jan. 02. perennial oultivotien.
- 80. Q. Of cooree one point has to be remembered; it is "all very well to talk of working a canal for revenue. But there is n limit to mency that can be speet without any hope of return, and that if any portion of that expenditure will bring a return, you will have more money to spend elsewhere—Suppesing the limit of expenditure of your purely protective works was 100 lakke, if you can get a return of 20 per cent, thee you can afford to spend 20 lekks more on the works?—That is true, but it would be better to more nn the works?-That is true, but it would be better to spend the money on wells.
- 61. Q. (The President.)—Why should not a man go in fur a well for sugarcane on a canal as well as aff. a canal; you say that off a canal hie land is used for ather crops; you dit not be a greater recommendation for takevi if he can go in for sugarous P—In ordinary seasons be does grow sugaroane on his well, but in a famine year he nhanges his system and grows fodder and food-grains.
- 02. Q. I do not see, where a man applies for takavi and goes to the exposes of digring a well, why he should not do it if there is the axtra inducement of onual irrigation to assist him in irrigotion. Why do you say that he will not come forward?—I did not say that he will not come forward? I will be might not. forward; I said be might not.
- 03. Q. (Mr. Ibbetson.)-With reference GS. Q. (Alr. Inbetaen.)—With reference to what you have just soid about a man who had a well changing his system in a yeer of drought, it would be just the enmo if a man growe cane on a well: he could not afford to let the cane go in order to water his other crops during the monseon?—The result in the Kaira district and generally the purpose was that all ordinary market smaller. throughout the Decean was that all ordinary market gurden crops were given up in favour of fodder and juari in 1896-97 and in the last famine, and there was an enormous yleld of fodder in consequence.
- 61. Q. By "given up" onn merely mean that they were not planted?—Yes, garden crops were not grown.
- 05. Q. It would be exactly the same on a canal. In a year of drought the people would profer to grow fodder instead of garden ereps P Yes, that happens on the Matha
- 06. Q. Then so far there is no difference between cannil and wells, the change of crop takes place equally on both ?—The proportionate area of garden crops under canals as compared with cane is much smaller than under wells.
- 67. Q. Nnw, so far as cane goes, is not the woll-ewner as much bound to give water to his caue as the esnal irrigator?—Cane pledges water far a longer period thou garden crops and the case area is less under wells then under
- 68. Q. You are arguing almost ontirely from the Kharakwasla. Are not the conditions exceptional there P There you have an enormous city with rich manure, land closs by, and wealthy capitalists who can easily keep an eye agon their investments. Do you think the sinte of affairs that exists near Poons would spring up if you had the canal for from the city?—The Mutha Canol is a special work; the conditions on other works would not be se
- 69. Q. How about wells close to Poona; would they irrigate a larger prepertion of case than wells elsewhere ?— Yes, probably, but case oultivators, prefer to use canal water, paying for it Rs. 50 per acre. They use their wells only in the hot weether when the caual supply is intermit-
- 70. Q. (Mr. Higham.)—What is the average percentage of cane under wells?—It is very trivial.
- 71. Q. If a man has 4 neres how much of that won be caue?—A fraction of an aerc, possibly.
- 72. Q. (Mr. Ibbetson.)—Is the proportion of cano grown under wells in the Decean smaller than in Gujarat ?—Yes, probably.
- 73. Q. Your impression is that it is smaller in the Deccan ?-Yos.
- 73. U. As to your preference for welle over candis, you have described the conditions under which wells can be made and worked profitably; and you have also taid us of a lorge area in which irrigation cannot be used profitably. Is there not a considerable intermediate area in which wells cannot be made, but which would be worth protecting by irriga-tion?—The areas of this class aucommanded by welle are

Mr. very considerable in Ahmedaagar, Sholapur, and the J. Mollison. Southern Mahratts Country. These uplands might be north protecting.

- 75. Q. So that there is a considerable portion which you cannot protect by wells but which can be protected by canals?—The meanro question would then come in. It would be a very serious consideration. There is a limit to extension on account of the supply of manure.
- 76. Q. All that means is, that protection by irrigation from wells is to be preferred because it is slower than canal irrigation?—I think the irrigation of lands manned under wells is more efficient than under canals. Regular irrigation is given instead of heavy waterings ones in eight days as is the case with canals. By heavy waterings from the canal the maaurs is swept away and the soil becomes water-logged.
- 77. Q. So that as regards that area which can be protected but in which wells cannot be made, your main objections are the fear of the failure of the manner supply, the nisk of water-logging, and the consequent salt offlorescence?—Yes, unless the system of canal irrigation is improved.
- 78. Q. I quits see the danger of water-logging ln Gujarat; hat with a shallow black soil with muram underneath would thore be the same danger of water-logging?—Even with muram below I have seen water-logging in the lower lying areas commanded by canal irrigation. This is due to direct leakags from the canal, and the drainage from over-irrigated high lands to lands lying at a lower level. The result of this loakags may be seen in overy mala on the G. 1. P. near the Mutha Canul.
- 79. Q. It is not so much the irrigation us the leakage in transit that you fear?—Yes; the less is enormous.
- So. Q. The loss of course is a mere matter of money, the water-legging is not. Sapposing that you kept all canal claunels full but did not put water on the land, well the leakage from the cause keep the nalas running? I want to know how much of this leakage is due to irrigation and how much to less from the canal?—The nalas were usually dry in the fair season before the canals were made. Now they are personnal. The most serious less is from water-legging.
- 81. Q. It is the actual irrigation you are afraid of than P. The leakage from the channels is much less than from the irrigated area. At the same time, I would like to state that Poons City is said to be water-logged since the causi was made. I know an instance of a well in the compound of the bungalow of the President of the Poons Municipality which cost Rs. 5,000, where the water level was formerly forty feet below the surfaces and it now stands fifteen feet from the surface.
- 82. Q. I want to got you away from Poona, if possible. The comparison between Poona and the ordinary canal is not satisfisotory: let us go into the villages. Is there much waterlogging on the Nira Canal P.—No. The disadvantages produced by water-logging are compared with the great advantages the canal has brought. I went through the valley in 1896-97 and found it green throughout. The advantages of irrigation there are great. I noticed very slight evidences of weste of water and of salt efforcescence.
- 83. Q. Nothing to constitute a material drawback to the advantages accruing from the canal ?—No.
- 84. Q. You say that the nalas run with water leakege from the canal. Does not that show that there is a very effective natural system of drainage?—Yes, that is so, but the railway often interferes with the free flow-off.
- The President.—We have heard that stated by several witnesses wherever we have gone.
- 85. Q. (Mr. Ibbelson.)—I should like to have your opinion as to how far it would be safe to apply a strong mrificial stimulus to the construction of wells. We are told that many wells under in the famine of 1896-1897 are lying disused, and that many of those made in the last famine will not he used again, and that so long as a men has capital only will he work his well. Would there not be the danger, if you stimulate well work too much, of the people completing them for the sake of the bounty?—There is no dealt that the people have had a very great knock. During the last five dry years the wells did not give a proper measure of their ose. I do not think that there will be any risk in stimulating the construction of wells to the fullest extent. After two years of good rainfall the people will come forward. They wiff not, I feel sure, want to go too fast.
- 86. Q. You do not think you would outrun the macure supply?—I do not think there will be any risk of that.

- 87. Q. You don't think people would make wells who could not afford to use them in ordinary years?—No.
- 88. Q. I take it that in the Decenn and Gnjarat a man canoct afford to work a well in ordinary years except for high class crops?—The actual rate of working a single mot well exceeds Rs. 100 per acre.
- 89. Q. Yoo object to canals bocaese their protection is absorbed by wealthy capitaliats. Is not that vsry much the case in regard to wells also ?—It is often the case in a time of fumine, if the well is n good one, for a number of families to clah together. They each supply a proportion of the labour and of the manne and each participates in the profit. This system of co-operation keeps the owner's own family and the others who work nuder the well off relief work.
- 90. Q. That is that a man will share well water with his friends ?—In Kira in 1899 and in Ahmednagar in 1896-97 that did occur in certain parts.
- 91. Q. We were told yesterday in Bijapur that such a thing was unknown. What is to prevent the people from doing the same with canals?—Because in my experience the wealthy land-owner, when the punch of famine comes, throws his responsibilities regarding the maintenaure of servants, etc., on to Government.
- 92. Q. With reference to the working of counts on protective rather than productive lines, to refuse water to cause in ordinary years would mean that the water would go unased?—Yes, the water would probably go enused dering the moresoon.
- 93. Q. Would the people use it for dry crops?-Yes, a good deal for the rabi crops.
- 94. Q. Thoy would wait to see first in an ordinary year if there is going to be a good rainfall.—Yes.
- 95. Q. At any rate much of the supply would be wasted?—The mater could all be used up for rabi and gorden oreps.
- 90. Q. You believe that if we brought the cause into a suitable tract, we could get all our water used for rabi irrigation, wheat, juani, etc. ?—Yes, these food-grain crops nu for market garden crops such as onious, sweet potates, etc., occupying the ground between October and Mosch. The water would be used for ordinary rabi crops not for personnal crops.
  - 97. Q. Erorything but sugarcane?-Yes.
- 98. Q. You think they would use all the water in ordinary yours?-Yes.
- 99. Q. Supposing you found that they did not, would you then teense to supply water to a crop of vegetables or cano because you thought the monsoon might fail?—I would refuse water if there was a chance of a bad monsoon in the coming season.
- 100. Q. If you could not use all your water on other crops would you then gire it to came?—After meeting the demands of the other crops I would give the halance to sugarcane.
- 101. Q. Now with reference to the royalty Government takes on water used, in the case of the Decean I quite agree with you. But in Gajarat where only two famines have occurred in 100 years, and where therefore the danger of scarcity is small, do you not think that it is reasonable that Government should take a small contribution for the water used 2—xes, perhops in Gujarat, but I would certainly creduce the Panch Mahals and other parts where the people are poor and it is advisable to encourage irrigation in every possible way.
- 102. Q. If I exclude all inscoure tracts would there be anything nurresonable then P-For inscoure tracts I consider that no water tax should be raised.
- 103. Q. I am assuming that the principle is accepted in regard to tracts in which relief is commonly needed?—I agree that Government can easily collect a royalty on water is secure tracts without causing hardship, but in bombay it is not worth while differentiating between tracts which are secore and those which are not.
- 104. Q. Yon say a Deccan well can be made for Re. 300 or Rs. 400, is that n fair average?—For a well of a depth of 25 to 50 feet that is n fair average. The expense in making a pakka well is not mach more than Rs. 400. Where there is soft soil to some depth the lining would be more expensive. But where there is 3 feet of black soil, then hard muram, and finally trap rock, Rs. 400 is a fair average price.
- 105. Q. Do you mean to say that such a" well would last indefinitely ?—I think so.
- 106. Q. Then why does a oultivator ever go to double the expense?—If the land is alluvial the well has to be deeper.

107. Q. In the Deccan ?-Yes.

108. Q. Why do the people go to the expense of making n pakka well when a kackcha well such as you describe lasts for ever?—Kackcha wells which last for a lang time are found only where the sub-strata are hard and durable. Many such wells are found throughout the Decean.

10b. Q. Are pakka wells built with stone and mertar throughout P-Yes, when black seil is deep it is necessary to

110. Q. (Mr. Muir Mackenzie)—Are the majority of wells you know in the Decembined or not lived ?—A great many are built up only on the mot side.

111. Q. (Mr. Ibbotson)—Now, Mr. Mollison, you were good enough at my request to look at the irrigation in the north of India, and to make enquiries regarding the differences which exist between the extensive equal and well irrigation ces which exist between the extonsive each and well irrigation as practised in the Punjab and Aorth-West Provinces and the intensive system as practised in Bombuy. Would you kindly tell us what is, to your mind the main difference between the two systems?—A vast area in the North-West Provinces and the Punjab is commanded by the Gangas and Junna systems of causal irrigation and by deep nad shellow wells in parts where the small distributing channels do not reach. The ordinary cropped area consists of very deep alluvial soil of very fue consistence and of great natural fertility. The character of this soil is such that after arrigation moisture is retained near the surface for a considerable period. This retentive quality is belied by copions deposition of dow throughout the cold weather and probably the atmosphere in the north of India at this particular season is a or marry so absorptive of sall moisture as In the more southern parts. The practical effect is that a tirst watering given from a causi or well softens the soil so that preparatory tillage for a rabi crop or for an early sown kharif crop is facilitated. The moisture remains in the soil until tillage is complete, the seed is sown, and satisfectory kharif crop is incilitated. The moisture romans in the soil until tillage is complete, the seed is sown, and satisfectory germination has occurred. Subsequently two waterings from a canal or three or four from a well is sufficient to bring n rabi wheat crop to maturity. This crop mixed with rape seed or gram is the chief rabi crop grown. The total cost of leading the water acer the field for the first watering, in laying out beds for irrigation, and in applying the water is very trival. It does not exceed 8 annes per acre. The distributing channels are made of puddled soil. They allow no lealings of water. The surface of the lields is even; the water in large volume is easily distributed; therefore the cost of the first watering is small. The villagers have the usual number of work and breeding cattle and milk bullhlocs of any ordinary district. The dung of and milk buffiless of any ordinary district. The duty of cattle, the litter and the hunscheld waste is carefully preserved. The manure heap which each occupant thus accumulates provides the only manure applied to the irrigated fields. It is a very light dressing; awing to the character of the soil and lightness of the irrigation, this light dressing of manure on an irrigated crop is quite as effective as if the soil was kept moiat by timely showers of rain. There is no difference in offect whether the irrigation is by flow or lift from causals or by lift from deep, medium or shallow wells. The contrast between this system of irrigation and wells. The contrast between this system of irrigation and cultivation and that necessarily practised in the Bombay Presidency is very pronounced. Medium black soil with murum below (the best black soil to irrigate in the Deccan) dries so quickly between waterings that irrigation is required every 8 to 10 days. The gorads (sandy loam) soils of northern Gujarat are se absorptive and dry se quickly that irrigation is required in the tair south every five me six plays. Such arrigation is exceedingly expensive from wells owing to the cost of mixing mater. Heavy from wells owing to the cost of raising water. Heavy dressings of manure are required on the limited areas irrigated because owing to cost of lifting water only very good crops will pay. A really good crop van only be produced from good sell by regular irrigation and heavy dressings of manure. Unfortunately the heavy and continuous irrigation washes much of this manure into the subscell and the groupout takes are a certail a proportion. sub-sell and the rroy only takes up a certain proportion. With this intensive system of irrigation a single mot or kas (leather hag) will only lift water from the deep wells of (bujarat for an area of aliont two notes and from the shallower wells of the Decean lor on area of three and n half form the form the little of the Decean lor of three and n half form the little of the Decean lor of three and necessarily little of the Decean lor of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the little of the lit statiower wells of the Decean for an area of three and a luft to four acres. In the Hissar, Delbi and Rotak districts of the Panjab I have seen deep, medium and shallow wells at work. I have found deep-wells, the masonry construction of which extended to a depth of 110 feet, with depth to water of 60 to 70 feet, irrigating cach six acres of whost or barley: medium depth wells 30 to 40 feet deep, irrigating 8 or 10 acres per leather bug, and on the riverain land, wells with 20 feet deepth to water irrigating 12 to 11 acres each. The year deep wells were this war worked some acres cach. The very deep wells were this year worked very

hord because the kharif crops owing to deficient rainfall failed, and there being no means of canal irrigation the failed, and there being no means of canal irrigation the failed, and there being no means of canal irrigation the failed, and there being no means of canal irrigation the failed upon the wells. Relatives or families fointly finding all the manure and labour required to produce the best results. The same practice occurs in the Decean and Gajarat in a famine year. The natural fortility of the tianges-Jaman alluvial soils may to some extent be gauged by the fact that on soil of this class in the Cawapare Government Farm irrigated wheat has been grown siece 1881 without manure and the eron of 1900 grown sioce 1881 without manure and the crop of 1900 yielded, approximately, of grain per acre 1,20 lbs. from one plet and 1,400lbs. from another. It may also be one plot and 1,400lbs. from another. It may also be gauged to some extent by the fact that in the Hissar district in the current year (a season of unfavourable rainfall) land irrigable by lift from the canal is freely rented out at Rs. 15 per acre for the year or at its. 10 to 11 per acre for one orep. Tenants pey in addition all irrigation charges. The canal water is only lifted a few feet und irrigation therefore is not costly. In the same district I found land irrigated from a well with depth to water about 60 feet rented at Rs. 8 per acre. It is not annual to take a kharif as well as a rabi irrigated crop in one season under e and irrigation, but it is more common to depend upon our good rabi irrigated erop or in a year of favourable raintall on one good dry crop only. If the latter requires to be once irrigated to bring it properly to matmrity, the charges for canal irrigation is 12 amos per acre and, as already stated, the cost of applying the water is trivial or negligible. The rates for canal water in the district inspected vary up to Rs. 5 per acre for sugar cane, Rs. 2-8 for wheat, 12 amos for a single watering, and half rates for water lifted from canal. I considered that approximately accurate outterns were more freely admitted by the actual cultivators than in Bombay; and from data communicated, I believe that the grain from an acre of canal irrigated wheet crop would ordinarily exceed Rs. 30 per acre, and of well irrigated and excluding cost of light dressings of mamme (the avinal value of which can only be approximately) other expenses including assessment coold not possibly exceed Is. 16 or Rs. 17 per acre. gauged to some extent by the fact that in the Hissar district can only be approximated) other exponses including assessment coold not possibly exceed lis. 16 or Rs. 17 per acre. The only risk is damage by rust, and that is inconsider-

112. Q. Pujarat is essentially a monsoon or kharif erop outsity; is it not, except for cotton? -Yea except for the extensive wheat and outton crops in Ahmudabad and Breach, Gajarat is a kharif province.

113. Q. Pulting aside the wheat and cotton tracts the whole of the remainder is kharif?—Yes.

113. Q. On the other hand the Descan, broadly speaking, is a rabi province?—These parts of the Descan and Southern Muhrutta lying inland noil some distance from the Ghats are chiefly rabi. The western talukas of Poona, Nasik and Khandesh me chiefly kharif. In the eastern black soil parts of Dharnar crops of coltan and juar are sown between the two measeens.

115. Q. What period is that?—In Dharwar cotton can be sown in Soptember or as late as October, as it gets the north-rast monsoon.

116. Q. Can you give me any broad reason as to why one province is khari, and the other rabi?—It is entirely a question of rainfall. In Sholapur and Nagar and the castern tolukas of Prona the important rain is the late or rubi rain. The character of the soil is such that if you have a good late rainfull, the rabi crop graws particularly well. In Sholapur and Ahmednagar with heavy October rain there is a good juari crop.

117 Q. Except in the tracts under the Ghats, I suppose very little vice is grown in the Decean? - Practically no rice is grown in the Decean, except under the Gunts, but some is grown in the western talukas of Belgauia and Dharwar.

118. Q. I suppose that is because the rain is lighter and the soil is not suitable?—In the Chats there is a minufull of 150 inches more or less, which rapidly diminishes till it is only 30 inches in Poous and 20 at Ahmediagar. The rainfall is small away from the Ghats.

119. Q. That exploins the absence of smull tanks ?- Ye-, they would not fill.

120. Q. We are told that people here will not take maler from a tank because they only get it for a certain partion of the year. They have the idea that if a dry crop is given water once, you must go an giving it water. Does that feeling exist and is it based on any reason?—I doubt if those are the true facts. I slould put the refusal to lake water down to various reasons. The soil may be unsuitable,

- J. Mollison, tank may not fill well; the occupants of land under the J. Mollison, tank may not be good cultivators. When water is refused from a tank, I should say previous enquiry before the tank 7 Jan. 02. was built, if properly conducted, would have accounted
  - 121. Q. You are far awny from my point. Teke the case of n canni, well established, irrigating sugarcane and garden crops; in a year of droaght the water will be used for dry crops, but in ordinary years the cultivators would refuse to take water for them because he is not gnaranteed a emply throughout the season. Do you think in a tank supplied from a permanent source we should find the same difficulty in disposing of the water P—1 should say there would be.
  - 122. Q. If we could get the capply from a permanent source would the people begin to use water is ordinary source would the people hegin to use nater in crdinary years for dry crops; supposing there was plenty of woter, more than they could use for first class crops?—In the case of n tank containing perennial storage I doubt if the water would be used even if the sapply is gunranteed. For juari only one watering is required and the cost of leeding the water up to the fields is considerable and would have n deterrent effect.
  - 123. Q. Yes, but if from the same cut he could get soveral waterings, is he likely to use the water?—For one watering it costs Rs. 4 to Rs. 5 for meking channels.
  - 124. Q. Though the cost would be the same whether he took one watering or half a dezen?—He would rather have one watering.
  - 125. Q. You don't think that on a tank where the supply ie liable to failure, the people could be induced to use the water by making the supply permanent instead of uncertain?—I don't think there would be much difference as regards their taking water from n tank with a limited or a permanent supply.
  - 126. Q. Supposing you have n canal, with plonty of water and a permanent supply esserted, which commands a large oul turnble area, what would be the maximum proportion of high class crops likely to be grown on an ordinary Deceau tract, supposing that you have mnauro and labour?—Probably not more than it would be under high class crops in an ordinary Decen tract
  - 127. Q. You told ue is Gujarat that one mot on an ordinary well would irrigate 2 to 2½ acres in ordinary years or twice that in bad years if the water lasted out, would the same figures apply to the Decean ?—With Decean wells 3½ to 4 acres may be irrigated at one time. The area, however, would not be doubled in a bad year, but would be increased.
  - 128. Q. You would not double the area in the Decean in a dry year?-No, the wnter in the deep nlluvin wells of Gujarnt does not sink soon. In the Deccan the wells sink sooner than in Gujarat.
  - 129. Q. Many of your best well tracts are in black soil; is the black coil more than 3 feet deep in the Deccan ?—The black coil is 3 feet or 4 feet at the most. At this depth it can be irrigated. If it is deeper the soil deteriorates with watering. As a matter of fact there is loss on wells in such lands.
  - 130. Q. Can you tell us the cost of repairing a well in the Decean F.—I cenuot give the figores. The people do not bove to do much in the way of repairs besides silt clearance,
    - 131. Q. A well does not need much repaire ?-No.
  - 132. Q. You speak in your note of the ray at being prevented from using caual water when the crop is in danger of

drought owing to permission to take water being necessary. Have you seen the results of this at any time. Have you eny personal knowledge on the subject?—Yes, I have seen the results at Poona near our farm. In 1899 the people did not apply for water till they actually saw their crope withering; thea they applied for water, but could not get the permissian in time to save their crops. On the Kirkee Farm we had a kharif crop and three waterings were found necessary. We wanted a first watering at once and ue took it, formal sanction being obtained afterwards. The crops grown compared favourebly with those of ordinary years and as market rates were high were worth double as much so usual, while all the oreps round about perished.

- 133 Q. (Mr. Muir-Mackenzie)—Do I understand that you got the water before you got the sanction ?—Yes; if we had waited for the permit the farm crop would have been past saving. We got the water by arrangement with the Canal Department and got the formal sanction after-
- 134. (Mr. Ibbetsen) I understand that you know as a fact that other people did apply for water but were so late in getting the permit that the crops died P—Yes that is so, but they waited till the last minute before opplying.
- 135. Q. As to your proposal not to give canal water for cane unless a man digs a well; so it not waste of water to give canal irrigation to o field already protected by a well?—The profits from canal irrigation are found greater in the case of expensive crops than from wells, so the cultivator takes cond water for vive months and uses his woll for the remaining three.
- 188. Q. But why allow bim to do so ? The area ho cao cultivate is limited by the enpacity of the well, so that he can irrigate it from the well all the year round ?—I should like to see it done in the new canals.
- 137. Q. These bandharas which you recommend to be extended; would you boild masonry dame or would you ollow the people to build kachcha dams and let them be washed away in the monsoons?—I would let them build them as they like. Big bandharas built with masonry would be more substantial.
- 138. Q. If Government built the bundharus it would charge for the water, of course ?—Yes.
- 139. Q. Do you think the people will begin with kachcha bandharas first and when they get used to them they will build pakka ones P—Yes, Government might build the pakka ones, but there would be no necessity for this if Guvernment do not charge for the water.
- 140. Q. You propose that the water should be given free charge?—Yes, I would like to see each talnka carefully charge ? and thoroughly surreyed. Any costs incurred in emveying ruight, I think, be charged to the caltivators.
- 141. Q. If all the bandharas possible were made would they irrigate anything like the area commanded by wells?—The area nuder bandharas would be small compared with the ares under wells.
- 142. Q. (Mr. Muir-Mackenzie)—Do you think that money could be usefully speat in extending the number of tals ?—I really bave not sufficient experience of tals to give an opinion. You ought to necept local experience give an opinion. You
- 143. Q. In Ahmedunger did you notice whother the land behind the tale had given crops ?-I did not notice them particularly.

WITNESS No. 74 .- Mr. GOPAL RAYJI TILAX, Retired Executive Engineer.

Mr. Tilak,

Answers to printed questions.

- 2. There is only a small portion of lead protected by irrigation works of all corts in this district, probably not greater than \$\frac{1}{2}\text{op}\$ of the total caltureble areo. The soil of the district is either black, red, or marmy and to a omall extent alluvial, and is almost wholly dependent on rainwater. Besides the small area under well and other irrigation, there are patches of land here end there on the banks of the Krishan and its tributaries, which derive benefit from inundations during rains. Rainfall in this district varies from 20 to 36 inches in good years. In years of scarcity it is below 20 inches. During south west monsoons, when the fall is regular and sulficient, there is no demand for water for kbarif or early crops. The rabi orops, however, require cold weather showers from the east from September to November. Gauden crops require waterfrom September to November. Gaiden crops require water-ing once in four to eight days according to the nature of
- 3. Black coil is bard when dry, but when wet or scaked in water it becomes soft oad yielding. It inffords a medium impervious to water when moist; when exposed it is limble to shrink and crack. Small tanks constructed in black coil hold water. They, however, require clearing of sill from time to time and removing my babul or other trees growing on the dam. It would not be safe to construct bigb earthen dams solely with this soil even when cupplied with maconry core walls. Black coils generally produce rahi crope, and require seasonable showers in the beginning of culd weather. The average rainfall may be all right, but if the tall be not in season crops in black coil may fail. Construction of tanks for cugh soils is not as impertant as for other classes of soil.
- 4. There is no old tank at Mamdapur near Bljapur, con-etructed during Mahomeden rule and serves to irrigate

about 100 acros of paddy or other lands. The olay other tank in this district is the tank at Muchkundi near Bagalkot, constructed in 1882. It has a masonry dam about 300 feet long, and 60 feet maximum height. This tank also serves a small area, but owing to some emise or other it has net yet proved to be a success, and cannot be depended on during years of drought. There are two other irigationt tank works in progress in this district as favance works, viz., the tanks at Sangogi and Hullur. They are both to lave earthen dams, and whom campleted are likely to prove a great baon to this district. The main river pasing through this district is the Krishna with its tributaries Chappeebha and Malprabha. The river, which has only a small flow in the hot senson, is about half a mile in width, and has high banks. The country about the banks is closmall flow in the hot scason, is about half a mile in width, and has high banks. The country about the banke is clovated. Under these circumstances it is highly improbable that its water can be used for permanent irrigation. Something, however, may possibly be dood to take advantage of the high level of water in the river during the rains. It may be stated that when there is failure of rain, and probably famine in this district, there are generally high and sometimes extraordinary doods in the river Krishan and its tributories. tributaries.

7. I do not think there are mare than 1,200 irrigation wells in this district and that each well on an average irriwells in this district and that each well on an average irrigates more than four acres of land for garden or other crops in ordinar; years. In the years of drought the area would be still less owing to low water level in the wells. So far as I am aware, no higher assessments are charged for hads irrigated by new wells constructed at rayat's own cost. It is both possible and desirable to stimulate the construction of new wells by liberal advances, and inducements from Government. Wells are cometimes failures, and it would perhaps be desirable to select for their sites partienlar banks of nallas where water is abundant, and in the first instance to construct kacheha wells at small cost, and when they are successful to turn them icto permanent wells. A large number of wells failed during droughts from 1807 to 1901. Where subsoll was mornen they have been deepened with advantage. The average depth of water below surface ranges from 20 to 30 feet. When the water level is below 30 feet, working of the wells hecomes costly. The cost of wells depends on their dismeters (when they are circular) or square area, depth, nature of sub-soil, cost of metericle and the kind of accutantion read. cost of wells depends on their diameters (when they are circular) or square area, depth, nature of sub-soil, cost of materials and the kind of construction used. For a well 10 to 12 feet diameter and 25 feet deep with dry stone stelling, the cost need not be more than Rs. 300 when the stone is within easy reach. For large wells 20 to 25 feet square, the cost may be 1k. 2,000 to Rs. 3,000. In land murniny soil requiring no stelling, except for a few feet at top-said below most, the cost at large wells may, according to its size and energy of springs in it, irrigate from three to twelve agrees of land.

- 8. In this district there is hardly any complaint of oxees-sive moisture in the sub-soil as far as erops are concerned.
  - 9. Relief labour was employed in the recent famine on-
    - 1. Roads.
    - 2. Road-nactalling.
    - 3. Irrigation tanks.

I do not think much has been done in the way at construction or repair to village tanks. The two irrigation works, viz., the tanks at Sangogi and Hallar, at present in progress as famine works, should, in my opinion, be continued and completed as ordinary works, not only to save from waste the large amounts already spent on them, but to serve as protective works during possible famines in future. Both the tanks are said to have large catchment areas of several square miles and to command extensive areas for irrigation under them. There is only one fear, and it is that the tanks in black soil districts are likely to be filled up with allt in course of time. This point, however, may have been fully considered in fixing the position of the outlet channels in the preparation of the projects.

# A .- GENERAL.

Question 1 -Tho neswors hellow refer to the Bijapur District. I have served in this district as Assistant Engineer, Public Works Department, about nine months during the famine of 1870-77, and for a further period of

about ten months from 1881 to 1882, and have, since my Mr. Tilak. retirement from Government service on ponsion in January 1895, resided here, ongaged in agricultoral pursuits.

7 Jun. 02.

5.—Leans under the Land Impravement Act ure to usual extent availed of by the people for irrigation purposss. The reason why they are not freely taken is that the oultivators do not care for irrigation in years of plenty, and when a drought comes they are nleady reduced to a state of poverty and helplessness and have no heart or energy to start a new undertaking, with the details of which they are not fully acquainted. Only rayats of means think of well-irrigation chiefly to produce green grass and fodder for their bullocks, the pinch of the famine being first felt by the live stock. To encourage well irrigation a beginning may, I think, be made in a good year, concessions heing offered to myats under one or the other of the six sub-heads to this question according to circumstances, and progress watched by the Revenue officers during their tours of inspection.

#### L.-Wuss.

34.—(1) The average depth of permanent irrigation-wells in this district is 25 feet in alluvial soils on the banks of nallas including about 5 or 6 feet depth of water and 35 feet in hard soils on sites at some distance from the nallas, including about 8 feet depth of water.

- (2) The supply is from perculation in alluvial, sandy ond soft muramy sab-soils and both from porcolation and springs in hard soils.
  - (a) In an ordinary year wolls keep up their supply and the water is sweet.
  - (b) In a year of drought the supply semetimes fails, but the water does not necessarily become too saline to use.
- 13) The average cost of construction of wells with areas not exceeding 150 square feet and depth 25 to 30 feet is from Rs. 400 to Rs. 500. Large wells about 20 feet to 25 feet square, and 30 feet to 40 feet desp cost from Rs. 2,000 to Rs. 3,000.
- (4) Wells when properly constructed, may last more than
- (5) The water is usually raised by means of n loather bucket (met), ropes and wheel, worked by a pair of bul-
- (6) Small wills command an area of 4 to 8 acres; largo wells with 2 or more mots 8 to 16 acres.
- (7) A small well irrigates on an average 4 nores of land, while a large one about 6 neres.
- 35 .- Well irrigation in most parts of this district is in its infancy and is merely a useful appendage to other valun le lands, serving in years of searcity to supplement fodder of good quality to a small number of selected live stock. It is not, as a rule, resorted to as a separate avocation, and is not n paying concern when all costs are taken into account.

36.—An nero of irrigated land with sugar-case, plantnia, or other valuable orop may, under favourable oirenmstances, yield a produce worth about Rs. 50 against Rs. 4 or 5 of similar land depending on rain water. Much, however, depends on experience and skill and lastly good luck of the man emplayed, as the crops are sometimes subject to the rayages at the hands of merciless thioves.

- 87 .- No higher rate is charged for well irrigation.
- -Serious difficultles are encountered
- (1) In the selection of a spot in which nample and last-ing supply of water is found. Wells whon first constructed often yield plenty of water, but whon worked for a fow mouths they sometimes full. In same cases excavations have to be given up as hopeless, as no signs of nearness of water appear or haid rock is mot.
- (2) Difficulties occur in the construction of a well when the excavation has to be carried through sand or other treacherons soil. Square wells built in such soils at great east snartimes full down, and to re-build them is a tedious task.

No professional assistance has, to my knowledge, over been either rought for by the parties concerned, or offered by Government or local bodies. It would be on advantage

Mr. Titak, if essistence ie respect of expert advice, trial berings and the nes of bering tools and pomps be within the reneb of 7 Jan. 02, well-to-do mysts wishing to undertake well construction and requiring such assistance.

-I am in favour of construction of wells in private 39.—I am in favour of construction of wells in private lands by Govornment, in special cases, as models in spects not yet tappod. I think a regalar servey of large nallahs for some distances from their juection with large rivers will have to be made for this purpose and plans propared, showing nuder-ground water levels at erory 4th of a mile to a depth of 25 fest from the sorface of ground. The model well should be safficiently deep to held water daring years of drought, and its construction should be as soand and economical as possible. The success of this well mey

- be the means of eacouraging well-to-do people to build others in their own property. People may be allowed free oss of water from this well for irrigation purposes at least for a few years.
- 40.—Temporary wolls are used in this district us a fororunner to permanent ones. They are also reserted to in years of drought. I would encourage their coestruction in a year of scanty rainfall by effering to supply from public fands, free of cost, all uppliances and materials, such as wood-work for support, stone for the trough, leather bucket and wheel, stc., leaving the execution only to the oultivator. These wells will prohably cust Rs. 50 esch, including materials and will, with small repairs, last two or three years.
- 1. Q. (The President).—You are a retired Executive Eagineer?—Yes.
- 2. Q. You were Assistant Engineer doring the femine of 1876-77 and yen retired in 1895 !-Yes.
- 3. Q. You are a landowner; where is your property site of the Muddebital toluka of Rijapar.
- 4. Q. With your knowledge of this district what do you recommend as the best means far preparing it against another famine?—Well irrigatioe should be encouraged in the first instance. Bot there is another suggestion which I would like to propose and which I think has not been mentioned by any other witness. The new method I would propose is that each village should keep a small stock of grain and in a year when the quantity of rain is very small u little of it should be given to supply the immediate wants of the people. In this district crops fail for the want of one tincly shower of rain. The full of one shower means presperity; the failure of one shower leads to misery. The people ure seldem prepared. Their immediate wants are fodder and groun. If there was a stock to last even for two ments they would have titee to think of what they might do. At present their stock just fails in a feating year when they want it most and they have no time to prepare for contingocies. I think that just as Government spends money on relief works they might spend some is the way I suggest. 4. Q. With your knowledge of this district what do you
- 5. Q. Would you make the rayats pay for this grain or would you take it out of Guvernment dues?—I suggest that part of the assessment should be taken in kind, two manas part of the assessment should be taken ic kind, two manss from the annual assessment for grain and one anna for fodder for two years only, and this should be kept in the village. It would be just like Government keeping a large cash balance. There will be a certain amount of grain and Government could turn it into money, only the interest would be lost. This would be distributed amongst the various villages nod each village in two years will have about its. 500 worth of grain. There are special sites in many villages for storing grain where it could remoie without damage for tee years.
- 6 Q. What woold yan do if you had it there for two years and no one wanted it?—Corn lests without lesing may of its good qualities for two to four years and I should ask the rayats far whom I store this grain to change it for new grain every two or three years.
- 7. Q. And fodder ? What about that?—Evon fodder can be kept.
- 8. Q. Do I onderstand you lo say that this store woold be given out in times of famine and drought just as now we give out payment for familie labour?—Is a year of drought I would distribute it only to the poorer people.
- 9. Q The rayat pays his assessment in cash as before and receives back a certain sum undirectly to help him in times of distress?—The rayat would have to pay 14 anums in cash and two nonas in giain. The latter would be issued by Government as a loan inhard times. What happens at present is that the poor rayat goes to his neighbour, and if he also is in want he goes to the Sowear who domands two bags of juari for the one he lends, when the crop is barvested. If the crop is a good one the man can easily repay two bags for every one bag he hes taken, but if it is middling be

- cannot afford to give two for oce and he is werse off than before if he gets no crop at all and cannot return the load.
- 10. Q. You want the Government to be a sort of corn banker P—Yes, I have heard one objection to my plan, and that is that it will be difficult to keen a watch over the and that is that it will be difficult to keen a watch over the grain. In this district there are grain pits six or sevee feet below surface and it is not possible for robbers to get the grain out of such pits in one night. It takes at least twelve hours to get down to any af the pits nad even if the pit is exposed it takes a lot of time to get the grain out as the month of the pit is very small. It is an excavation in bard maram of X of of globular form at the bottom and reclosed to a fannel at the top. It requires no cover other than a slab and no gnard and would be outside the villages. The village authorities might, I think, be held responsible for the safety of these grain pits and fodder streks. The storing of fodder would result in the preservation of a certain number of head of caltle which are required for the oultivators' operations.
- 11. Q. What is the hest way of raising crops in a famine year? By wells in this district; lorge tonks would also be n good meons.
- 12. Q. But you here a large tank and no one lokes any water from it. Do yoo know the Much kundi tank; that irrgates only 40 acres although it could irrigate coosiderably more?—I here seen the tank. I had only one or two water supply projects before u.e when I was in the service.
- 13. Q. You know the Sangagi and Hullur tanks; how much isoney has there been spont on them?—Aboot Rs. 80,000.
- 14. Q. How much remains to be speet?—Only the ex-
- 16. Q. Supposing ordinary labour had been pot in the tanks instead at famine labour, would its 80,000 bive been spent ?- No, only about 4th of that sual.
- 16. Q. You say temperary wells can be made for Rs. 50. What can you da for Rs. 50?—We can excavate a pit 20 to 25 fort deep for Rs. 50.
- 17. Q Will it last lung ?-It might last 2 or 3 years, if there are not heary mias.
- 18. Q Do you find water at 20 feet ?- Yes, un banks and
- 19. Q. (Mr Muir-Mackenzie)—Here you any tale on your lands; and du you ind that your lands are protected by these tale and that you get better crops by means of them in years of drought?—Yes, there are tale on my lands; I get better craps only on these portions which go under water.
- 20. Q. Is that a material portion ?-About 10 per cent
- 21. Q Why do you build your tals ?-To prevent the water from running out and to give muistore to the fields.
- Q. Does it give you a better crop in ordinary years? -When there is pleuty of rain they a shot of much use, but in those of drought tale are very useful.

# TWENTY-NINTH DAY.

# Belgaum, 9th January 1902.

WITNESS No. 75 .- MR. RUDBAGAUDA CHANVIRGAUDA ARTAL, District Doputy Collector, Belgaum. : - Answers to printed questions. I.

2. Cultivable and Irrigable Area.—The cultivable areas of the Bolgaum District is 2,224,283 acres.

The fallowing are the proportions of the cultivable areas to irrigated areas :-

## Area irrigated from-

						Acres.	por cent
	Government canals				-		r '20
	Wells					29,695	1 33
	Tanks	•	•			. 9,079	•40
,	Other sources	•	•	•		. 6,899	34
			Tor	AL		50,180	2 25
•							

The character of the soil is Masari (red), Karla (clayoy leam) and Yari (black).

Rainfall.—Near the Sanliyadris the rain of the south-west meason is very constant and heavy (Belgaum and Khanapur). Further east (Chikadi, Gokak and Sanngaan) it is fitful. The eastern talukas shaw a fitful fall, but this is supplemented by a seanty supply from the 10 th-east monsoon (which comes generally in October or later). Ordinarily there is no domand for water in the sauth-west monsoon. The crops which generally require irrigation are sugarcane, betel loaf, turmoric, onians, garlio, vegetables (root, leaf and pod), plantain trees, "Javi Godi," etc. They require watering once a week or once a forinight at least. The area under a crop is divided into parts each of which is watered ut a time. The irrigation revenue is generally reviized in the form a cansolidated assessment in the case of tanks. In case of canals of continuous flow (Gokak canal is the only canal of this nature in this district), the revenue is levied in the form of a separate water-raie. Rainfall .- Near the Sanliyadris the rain of the southwater-rate.

3. Black Cotton Soil.—As far as I know, black cotton soil is of little use for extending irrigation. Ordinarily the gardon crops, such as online, garlie and a few vogetables, may grow, but for betel leaf gardons, for plantin trees, otc., which require ample water, the soil is useless.

Small tanks constructed in such soil hold water only for a short period—say, till the ond of December, unless early rains are heavy—and it is not at all sufficient for an extensive irrigation. Generally the water is used by mon and cattle for drinking. High earthen bandles are dates cannot be made of such soil without masonry core walls, inless perhaps the dams are very wide at the base.

Black soil has a great moisture-retentive power and hence there is no demand for water except in case of prolonged drooght.

There is no derire on the part of owners of black soil for irrigation.

4 and 5. For the description and the number of irrigation works I have nothing to add to what is so olaborately described in the pages of the "Bombay Gazetteor," Belgaum, Volume XXI, pages 210 to 241.

O. I haro not the requisite statistics of the district or village warks. Government have not as yet clearly been given to understand the extent of their responsibilities to unaintain these works. No settlement report gives any information about these. In a year of seanty minifall these works naturally fail to be as useful as in ordinary years; yat I do not think that any remission has been granted or claimed by the rayats. The case of Gaddikeri at Magutchan-Hubli may be mentioned as an example. The District Beard have not done any irrigation work. The Local Boards, as at present constituted, will not, I think, be able to undertake these works will be greatly increased if more money and greater attention to their up-keep he pald than at present and a few rules be made for this purpose. It will not be quite uncustomery if the rayats who are directly benefited by these works be made to work or provide labour for their ordinary repairs or clearances for three or four days during a year. Their value for demostle purposes depends upon their situation. 6. I hare not the requisite statistics of the district or vil-

7. I have not the statistics to date. The opinion I hold respecting the wells is given in nuswers to another set of qo estions.

8. No drainage work is necessary in this district.

9, 12, 18 and 14 I have not the requisite statistics to enable me to answer these questions with uny degree of acentacy.

I may add that the works on which relief labour was generally employed in this district were read and earthworks and motal-breaking. I think that of the works reunining uncompleted, those of Saundatti-Dharwar and the Murgod-B il Haugal Roads require early completion, as otherwise it will hinder the traffic between the places and the works will prave of no use to the public.

#### II. A. General.

1. My answers particularly refor to Parasgad, Sampgaon and Khanapur Talukas of the Belgaum District and generally to similar tracts of the rest of the Belgaum District and of the Dharwar and Bijapur Districts. I have visited several places during my last 25 years' service in the capacities of clerk, Deputy Chitnis and Chitnis to Collectors, of Natire Assistant to the Cammissioner, S. D., and of a Divisional Officer. Besides, I one paddy fields in the Dharwar District. I have also seen almost all the tanks in the Belgaum, Dharwar and Bijapur Districts.

2. The rainfall varies much in different parts of the three talukas. The average for Sampgaon which is situated hetween Khanapur and Parasgad is 29 89, that for Parasgad 24.78, and for Khanapur 67.27 luches. I was oble to collect figures of the average rainfall in each much of the year for the Sampgaou Taluka only. They are as follow:—

Avorago of 10 years from 1891 to 1900.

						тпопоз.	COMP
Japuary						1	Yil.
February						0	5
March						0	33
April	·		,			2	41
May	•	·				2	41 61
- Jnno	Ī		·			5	55
July	•	·	-		·	5	55 32 88 25 89 58
August	•		-			3	8B
Soptombar	·	-		·		3	25
October		-	·	·		4	89
Novomber	•	•	:			Ó	58
December	•	:	:		:	Ö	9
				_			
				To	tal	23	96

- 3. The circumstances and conditions of the talukas vary so much that the same reasons do not apply equally to all parts of the same talukas. Obstacles Nos. 1, 2, 3, 6 and 7 do not exist in any of the talukas. Unsuitability af soil is not with in the Parasgad Taluka. Only in the deep black soil continuous irrigation has not proved advantageous. The fith abstacle exists in Sawpgaon and Parasgad Talukas, while in the Khisoapar Taluka the rain is generally seasonable and sufficient. In the case of irrigation by erecting dance across nalles, this obstacle is less as the supply of water lardly runs short in an ordinary year. Obstacle No. 8 exists in aliemated villages in which the Inaudar has power to rack-rent his tenants. I think that a law providing the maximum rent to be recevered from the natual tillers of land may be onacted in case of alienated villages. Among "other reasons—(9)" the prominent ones are want of expert opinion and lack of capital and unity nurse the oultivators to utilize improved means of irrigation.

  4. I do not know of acy such exemption granted. (3) 3. The circumstances and conditions of the talukas vary
- A. I do not know of any such exemption granted. (3) Nearly all the towarts in my charge are tenants-at-will and they do not effect any material improvements in irrigation at their own cost. (i) Section 107 of the Land Revanne Code adequately protects against any future enhancement of revenue, having regard to improvements offected in any land during the currency of any pravious softlements at the cost of the compact or the holder.
- 5. The leans are applied for frequently, yet I found very few cases in which any extension of irrigation was really

Mr. Artal. attempted. I can, however, give one example here, that of Sir Dosai of Shirsangi, Taleka Parasgod, who has 9 Jou. 02. constructed by the sid of a tegai grant of Rs. -75,000 a large tank near Shirsangi is order to extend irrigation to lands in two ur three of his Inam villages. This is, of course, a case of a big laudholder. But to create a real testo for irrigation among the ordinary mynts I would propose that in selected villages special measures for the encouragement of these loans should be adopted. It case of new lands brought under irrigation by means of wells only interest at a lower rate, say of 3 per cent, may be charged, and if through a deficient supply of water or for other good reason the undertoking proves a failure interest other good reason the undertoking proves a fallure interest may be remitted altogether. The period of repayment does may be remitted altogethur. The period of renayment does not indinarily call for any extension. I would also propose that in case of tanks remission of interest may be granted in a particular year in which crop suffers for want of indequate supply of water. I am af opinion that special encouragement by means of grant-in-nid or otherwise may also be given in esse of large and speculative works, such as large tanks, wind-mills and utilization of river or of strong water by means of machinery, etc.

- 6. I have not come neross an inclance of this kind.
  - (3) The oultivoturs of course want the means of irrigation extended provided the cost is not probabilitie.
- 7 to 11. There are no eanals of continuous flow in this chargo.
- 12. After the cessalion of rains small earthen doms are 13. After the cession in rains small earther dains are thrown across some perennial nalles at selected sites and water is let into the fields by means of channels. In the Khanapur Taluka, where the early rains are certain, sugarcane plantations are fed by water baled out from these tomperary resorvoirs. The doins are generally washed tomperaty resorvoira.
  - (3) The period depends upon the nature of male and the crops raised: in a year of number rainfull the supply lasts till about the 15th of March. In a year of scanty rainfall it lasts till the end of November, and in a year of drought there is searcely any water outliebent for irrigation |mrpover
- 13. The mode of irrigation described above enables a cultivator lo raise valuable crops, such as engarcane, garlie, entons, green regetables, etc. In a year of senaty raisful green fodder or its substitute, maire, etc., is raised. These lands are generally of a mediam quality. I cannot give with accuracy the value of the irrigated and unirrigated crops.
- 14. As an irrigated erop mainly depends upon water, the entire crop withers as the supply of water ceases or if it eannot be properly maint dired.
- 15. In the case of garden lands brigated by means of canals described above the irrigation is almost always supplemented by wells, particularly during the period from March to June. In the case of sugarcane crop raised in the Khanapur Taluka well nuter is never used.
  - 16. I cannot give figures.
- 17 The conals I have described are not many and none of them are more than 300 or 400 yords in length. The owners of the fields ore generally the awners of the canals. Government have fixed a consolidated assessment on these Linds. It is for the Survey Department to mention what amount of irrigation rovenne has been levied. The farmer or the owner generally gets i to irds of the gross produce on the land netually irrigated.
- 18. The expenditure necessary for the kind of irrigation is the cost of dams which varies from 10 to 50 rupers and the charges for the up-keep of the channels which the tenants mainlain.
  - 19 Nn such instance has come to my knowledge.
  - 20. Tide answer to questions 17 and 18.
- 21. All these cannis ar daws are constructed by private persons. Disputes with regard to them are very rate.
- 22. I am of opinion that construction of these canals or 22. I am of opinion that construction of these canals or olimneds should be encouraged as much as possible and proper recard kept of them. If possible, dams may be creeted pakka with a large sluice for the ruin water to escape during the mensoon. At present the grantest defect is that no records of such warks and of the lands irrigated by these means are kept, and the supply is not well regalined. I think Government should easist the cultivature by arrelation the surface of a replacement was a story of some providing the services of a professional man who should take level and inform the cultivators whether water from a selected spot could flow to his field, etc. Besides this,

Government can remit the water-rate leviable under Section 55 of the Land Revenue Code and give advances without interest. It so hoppens, particularly in years of drought, that a riparian occupant cannot obtain in time the permission of the Collector to use the water, and the consequence is that his crops fade away and parch. I think that in such cases the people may be allowed to take water freely and save their crops. In such cases the Collector chould issue general orders permitting the free use of such water.

## D.-TANES.

23. Tooke oro made by bonding or arresting the flow of n nello or a watercourse in a convenient place by means of conthon dams creeted crosswise. The site is generally such as to command the largest cotchment area and is an a high level, so that water from it may flow easily to all the lowlying laads. Each tank is genorally provided with one or two sluices which supply the fields with water. One waste woir which gives passage when the tank is full and one main conduit which supplies the tank with water from the adjoining country fulfil the requirements of an ordinary irrigation tank.

No perennial irrigation is carried on under these tonks. They are intended to farnish the paddy crops with water when the rains hold out, and in case the rains be number to provide water for sugarcane cultivation in the munths of March, April, and May.

In a year of ample minfull the water is generally used for sugareans erop which requires from four to fru materings with an internal of about a fortnight to 20 days between every two waterings. The supply therefore is undo to lust till the end of May. In a year of scantr cain the water or part of it is generally used for growing paddy erop and thu area for the sugarcane crop is prepared to a small extent only. In a year of drought the water does not suffice for the early paddy erop.

The area irrigated varies according to the capecity of a tonk. The minimum area may be taken as 5 acres and the maximum I met with in this charge is about 337 acres in the case of the Galdikeri Tank of Magnithan Habil.

- 24 and 25. Tide answers to Questions 23, 13 and 14.
- 26. The irrigation is not supplemented by irrigation from
- 27 and 23. The replies to these questions are the same ususes given for Questions 16 and 17 above, except that the enlievator pays for the entire irrigable area.
- 29. The only private anatal expenditure is the upkeep of out silt from the waste water channel, couldn't, such ustaking out silt from the waste water channel, couldn't, etc., are done by the tenants, but repairs la dam, alute, elc., are generally undertaken by the landlord or Government if extra assessment is charged.
- 30. Tunks which are not the private property of individnuls are separalely surveyed and shown as such in the village records. The procedure fullawed in case may repairs, are found necessary is generally as fellows : if needs repair the rayuts concerned petition to the Collector, who forwards it on to the lixeculive Engineer for consideration or disposal. Sometimes the Executive Engineer. who forwards it on to the Executive Engineer for consideration or disposal. Sometimes the Executive Engineer, receives such petitions direct. But in any case the Collector is referred to with regard to the callection of the D per cent. contribution. If the contribution is reserved the Executive Engineer, who has already prepared his plan and estimate, submits his proposals to the Soperintending Engineer for station or approval and the work is then executed. Now according to the present system of leving the 10 per cent contribution from the rayats, it so happens that in most cases the centribution is not paid by the mysts in time awing to disagreements among themselves or to their inability, and the resolt is that grants for repairs often lapse. In other cases though the rayats pay their contribution promptly, yet want of necessary funds or provision in the budget deloys the undertaking of the repairs, etc., by Government. In any case the rayats become the losers. I do not see why the rayate should be required to contribute towards the repairs, etc., af tanks when they are already sufficiently taxed in the shape of a consolidated assessment for using the water of a Government tank. The fair way would be to keep the munagement of such tauks entirely in the bands of Government and to incur whatever expenditure be necessary to keep them in proper order. My views appear to be in accord with those of the Tank Committee which sat in 1891, and which also prescribed coughly the amounts that would be necessary for the repairs of tanks in the Beignum, 1893, and which also prescribed roughly the amounts that would be necessary for the remires of tanks in the Belgaum, Dharwarand Kanara Districts. According to the opinion of the Committee Rs. 1,40,000 was an adequate sum for expenditure on repairs of tanks in the Belgaum District, vide

Government Resolution No. 34-W.L.419 of 5th March 1895 (Public Works Department)

According to the present system the rayats who are expected to take the initiative in the matter are always dilatory for want of unanimity or of means to pay the contribution, and so the repairs which Government undertake are not regular and systematic. There is no accurate record of the area irrigated from such tanks from time to time and of the turns or modes in which an individual cultivator chould utilize the water. There is no record at hand of extra assessment recovered on account of each of such tanks. The consequence has been that many of the tanks have got silted up and on account of dispute among the cultivators proper repairs are not effected. An improvement in all these respects seems, in my opinion, necessary.

- 31. No tank of any considerable size has been constructed by any private person except by the Sir Desai of Shirangi near Shirangi. The tank is estimated to irrigate about -1,000 acres.
- 32. For the successful nnl good growth of paddy or other late crops in those fields it is essential to have these tanks in good repairs. The only fear is that if they be too near n village the weather is likely to become unlavious by the growth of rank regetation therein. The way to encourage their construction is to advance leans free of interest.
- 38. From the description of the tunks it may be seen that they are liable to get silted up enouyear. I have not ascertained the depth of each year's silt. Some of the tanks have become eilted up daring the course of 20 to 25 years. In one or two cases I have noticed that a silt of shout five feet has been deposited during a decade. No dredwing is resorted to; but when the tanks get dried up in the hot weather the silt is removed and thrown on the dam or used as minure or for bricks, etc., and the bed despende. In a year of drought these tanks may be adequately deepened and famine relief provided.

#### E .- WELLS.

- 34. The talukas I write of may be apportioned into-
- (1) Mountainous truot—bounded on one side by the crest of the Sanhyndris and on the other by n northsouth line drawn along the Khanapur-S.pa Rand.
- (2) Hilly tract to the oast of the above trust lying between the Khunapur-Supa Read and the north-en-t line passing through Deshaur, Purashwad and Mugntkhan-Hubli.
- (3) Undulatory tract to the east of tract No. 2 bounded in the east by a similar line drawn through Inchal, Bail-Hongal and Belavdi.
- (4) Sandstone hilly tract which interposes here and there and contains pubbles, lateries, stones, etc. This soil is inferior and very porous.
- (5) Black soil plains nuderlaid with shingle, limestones or any other hard sub-strata.
- (6) Deep bluck soil plnins.

The characteristics of the different tracts vary mach. In tract No. 1 no irrigable land sxiste. In tract No. 2 tanks and the impounding of water of nallas are the moans used. Welle can be sunk but only in law grounds which are in many cares rice fields. The soil below is trencherous; as secon as a spring is tapped it gives way. Consequently it is very difficult to build pakka wells in this tract. Tracts 3, 4 and 5 are suitable areas for irrigation. Wells are generally sunk along a nala or watercourse in low ground. The underground is of trap, ilmestons or soft murnm. Water is fairly good and well adapted for irrigating the fields. Tract No. 6 cannot, except at a very henry expenditure, be irrigated by wells.

The depth of a well varies also in different tracts. In tract No. 2 it is about 10 to 20 feet. In tracts Nos. 3 and 5 it ranges from 12 to 30. In tract No. 4 it is very uncortain; in some cases it is 10 feet, while in other places

it may be about 35 feet. In tract No. 6 the depth ranges Mr. Artal from 40 to 120 feet.

9 Jnn. 02.

All the wells get their supply from springs, which in n year of drought fail or 1111 short invariably. None of them are liable to become saline.

The cost also varies. In tract No. 2 it is about Rs. 4'.0 while in tracts Nos 3 and 5 it is about Rs. 200 for a kachcha well and Rs. 600 for a pakka. The peer agriculturist generally digs a pit in a hard ground and builds a masonry wall just sufficient to ply his mot safely. Such wells cost about Rs. 200 The same well, if built pakka on all eides, would cost about Rs. 600. For a large pakka well in medium soil the ovet is about Rs. 3,000. The kachcha well lasts for about 12 yeers and a pakka well from 50 to 100 years. Water is invariably raised by means of a mot or leathern bag. The average area attached to a good well is about 2 acres and that actually irrigated about 1\frac{1}{2} neres. This area depends, however, on the kind of crop raised. The sagaroane crop cannot be irrigated more than half an acre by means of a single mot, while vegetable crops to the extent of two mores can be raised by the same means.

- 85 The lands under well-irrigation are generally of a molium quality. Irrigation enables a cultivator to raise crops twice instead of once or to raise such orep as sugarcane. In a year of ample rainfull the yield is nearly seven or eight times more than in the same kind of nairrigated land. In a your of scanty minfull the yield is two or three times more than an unirrigated crop.
- 36. The yield, which of course is charged with exponses of enlitvation, is worth about Rs. 200 if the crop is rich, while the value of the unirrigated crop on the same land is Rs 20 or so per nere. In a year of drought it is about Rs. 75.
- 37. The oultivator generally pays in kind half a chare in the produce of the land. If money is paid it is generally paid at about 50 to 75 per more it the land be good. Government does not receive may extra rent beyond the currey assessment, which takes into account the adaptability of the soil to gardens. The Government rate varies from Rs. 1-12 0 to Rs. 3-8-0 per acrs. These rates are paid on the irrigable area.
- on the irrigable aren.

  3S. The selection of a cite ic generally made by local experts. I do not think that any Government nid would benefit the cultivatore in this matter. In the construction of a well, however, some difficulties are encountered. The difficulties in my opinion are want of good being or blusting tools and materials when the ground is hard, pumping out water, etc. An assistance has over been effected by Government or by any local bedies in the shape of expert advice, trial borings, etc., may be useful where (as in a grent part of the Paraggad Taluka) the rayats entertain little hopes of getting water by sinking a well. I think it would be advantageous if a fixed amount in the Provincial water grant is allotted ununally for experiments in such tracts by means of trial borings by District Local Boards.

Another wny is to keep in stock this improved appliances for sinking wells, and the onlitivators should be succuraged to take a loan of these. At first special facilities should be offered to make use of these by kesping for biro at soms selected convenient centree.

- 32. I am not in favour of constructing Government wells in private lands, because the cost will be more than when constructed by private individuale. The selection of sits will not be made as easily as the cultivators do. The owner of the land may not accept the terms offered by Government. The maintenance charges will be beavy and there will not be a good return for the enpital expended.
- 40. In some of the paddy fields, when water can be had at a depth of 5 or 6 feet, temporary rough wells are dag in ordinary years and by these means second orops are raised. Such lands are very few and are situated in tracte which are practically free from families. Consequently they do not require any special encouragement.
- 1. Q. (The President)—You are District Doputy Collector of Belgunm?—Yes.
- 2. Q. How long have you held that position?—Since Angust 1898; before that I was stationed in Bijapur. I know the Bijapur and Dherwar districts well.
- 3. Q. In paragraph 2 of your memo, you give the proportions of the culturable areas under certain works. The total of 50,180 norss includes 6,899 under the head of "other sources." What other sources do you refer to?—

  Patasthal irrigation from the streams.
- 4. Q It is a large area P—Yes, the advantage is that Patasthal arrigation can be carried on from streams without dams.
- 5. Q. You know something of the bandhara cystem in Nasik?—Yes. The system is very important there: we buys nothing of that kind in this district.
- 6. Q. Is there may reason why there should not be?— The rivers are too deep; and therefore not suitable for bandharas.

Mr. Artal. . 9 Jan. 02.

- 7. Q. You say that "an obstacle orists in alienated rillages, in which the lummdar neckerouts his tenants." Have the tenants no rights in these villages?—They have proprietory rights to bold the land; but they must pay taxes to the lummdar.
  - 8. Q. Can he raise it as much as he likes Yos.
  - 9. Q. And is there no appeal ?- No.
- 10. Q. You describe the case of an Inamdar who got a 10. Q. 100 describe the case of an immular who got a large sum of unjuny from Gavernment. Is he a large Imamdar?—Yes, Sir Desii of Shirsangi in the Parasgad Taluka hes spent a large sum of money in huilding a tank. Besides the Rs. 75,000, tent by Government, he has opent another Rs. 75,000 out of his own pocket.

  11. Q. Is it a very large tank?—One thousand acres will be commanded, and much sugarcane will be grown.
- Four Inam villages are commanded.
- 12. Q. Wes it done as a famine relief work?—The tank was condemned by the Assistant Engineer, but the Inaudar completed it by famine labour and it has proved very
- 13. Q. In paragraph 5 of your memorandum you say, "I am of opinion that special encouragement by grants-inmid or otherwise may be given in ease of large and speculatiro works such as large tanks, wind milts and the utilisation of the rivers or streams by means of machinery."
  Have you known at any application being made for taker's
  leaus for works of that description.—For tanks and noils
  there have been applications, but not for works by machiners.
- 14. Q. Were any other applications for loans for lanks recoived besides the one you mention?—No.
- 15. Q Have you had any applications for pomping up writer?—Air. Joyner had a scheme on the Malprabla river at Gardi-hoofir, where pumping might have been done. [Mr. Beale explained that the scheme was rejected as an irrigation scheme. It had never been considered as a pumping scheme].—There is another project at Yergandi near the Golah works.
- 16. Q There are very few tanks in the district compared with other districts There are 400 tanks in Supgaon, 500 in Khanapur, and some in Belgaum.
  - 17. Q. Are they small tanks? Yes, small rice tanks.
  - 18. Q. Is there room for extension of tanks ?-Yes.
- 19. Q. Are small tanks preferred !-Yes, in years of good ramfall the people arrighte came from small tanks.
- 20. Q Do they last all the year round !-Taoy last till the middle of March.
- 21. Q. Is that enough for sugarcano ?-Yes, sugarcano is rown in Tebiu ery.
- 21. Q. Kar'y tain in April will keep up the sugarcane erop. If rain does not come, will not the crope suffer?

  We generally get April rain. We water the crep once and then we depend ou min-water.
- 23. Q (Mr Ibbetson)—I noticed that in your printed memorandum you say, "the sapply, therefore, is made to last till the end of May." Is that not a misprint far March?—Yes; with good rainfall it would last only till March.
- 24. Q. (The President)—Do the people here ever irrigate ease from wells, when the tanks are stry?—In the Chikodi Taluka, they grow cano with well water. The best ougar and is that grown under wells. In 1887 there were 4,287 tanks, but there has been an increase of 50 per cent, and the number now is 6,327.
- 25 Q (Mr. Muir-Maclenzie)—Is that for the Chi-koli Talaka alone ?—Yee.
- 26. Q (The President)-Is there good rain in that talakal-Yes. It is rocky and well suited for sinking wells.
- 27. Q. Is there the same proceedty for irrigation in Athni f.-The Athni, Golad and Perasged talakas are libble
- 28. Q. (Mr. Muir-Mackenzie)—I noticed that thry graw n gond deal of toluteo in Chikedif—The Chikedi entiredors are Jains and they are very expert. The best tabacco is irrigated from wells. The ordinary tobacco depends on rainfall. The best gul is grown under wells; and the whole of this is experted.
- 29. Q. It most be a highly favoured laluka as regards rninfall :- The rainfall is not more than 25 inches. The have streams and the land is rich in water-bruring strains.
- 30. Q. (Mr. Ibbetson)-When do they sow the to-bacco?-In September.

- S1. Q. (The President)—Do you think there is room for a large extension of tanks throughout the district?—The sites are not outable. In the Parasgad taluka it is very difficult to get water.
  - 32. Q. Is that all black cutton soil ?- Yes.
- 33. Q. Do the papel not sink wells in black cotton soil?-No, because, if they got water, it is generally brackish.
- P4. Q. Is the soil deep?-Tho black soil in that district is from o to 10 feet deep in some places
- 3ü. Q. (Mr. Ibbetson)-What is then underneath it?-White soil like ashes.
- 8% Q. (Mr. Muir-Mackenzie) What the Public Works repartment call muram. Yes,
- 37. Q. (The President)—Is the Snappaon taluka liable to famine?—No, it is not, but the coal is soft, and not suitable to irrigation.
- 38. Q. What can you do for the Athni Taluka?-I passed through it: it is very rouch like Juth.
- 39. Q. What can you do for Jath?-Wells could be made there.
  - 40. Q. Could you have tanks? -I do not think so.
- 41. Q. I nuderstand that Athni is the worst taluka in the Presidency P What ran be done for it P-Irrigation from the Krishna is not possible in Athni.
  - 43. Q. What is the reason. Is it too low?- Yes.
- 43. Q. The Tassi lank was given up. Do you think the tank would have been usefulf-Yes. If it had been successful, it would have protected a large area.
  - 41. Q. Is irrigation possible from the Dari river ?-
- 45. Q. Do you think then that wells should be encouraged more than they are?—Yes, wells could be constructed in Sanniatti in the Paragad Taluka. I know the
  case of a man, who has five neres of had, who has onill a
  well there. The assessment is very low, Rs. S. Formerly
  he need to grow juari, but he converted into garden evop
  and was able to let the land for Ks 100.
- 49 Q (Mr. Muir-Mackenzie)-What is the cost of such a well P-Rs. 1,0.M. That particular man has applied for Rs 1,000 to complete his well, and I concluded him a inkavi lom setenlay.
- 47. Q. (The President)-You must have a great number of applicative for takeri. Yes, in a great number of cases they really want money for subsistence.
- 48. Q How long down it lake a man to get a reply to his application?—It depends, it may be 16 days or one month. I think some other section, leading money, abould be divised, such as Agricultural Banks, which should replace the talari system.
- 49. Q. Yes, but do you think the Banks will be nike to recover?—The Builes should be given power to recover in some summary way. I know that Sir Demi of Shir Sangl and Wantmori has lout as much as Rs. 50,020 to the rayous at the rate of Sanuas.
- 50. Q. (Mr. Muir-Mackenzie)—I suppose they have lent it to solvent men?—Yes, they have taken great care about that.
- about that.

  51. Q. (The Prevident)—You say in paragraph 6, "I do not think that any remission has been granted or claimed by the rayats. The case of the Gaddikeri at Mugult-Khan, Hubli, may be mentioned as an example. The District Local Boards have not done any irrigation work. The Local Boards have not done any irrigation work. The Local Boards, as at present constituted, will not, I think, he able to undertake these works. I am of opinion that the Protective value will be greatly increased, it more maney and greater attention to their up-keep be paid then at present, and a few rules be made for this purpose." In whose lands should the Government place them. In the kands of the Revence officers?—I think the Pablic Works Department could look after them better than the Revoce officers, who are overworked. the lierrooe officers, who are overworked
- 52. Q. Gould the Public Works Department give their intention to an all tanks of five or oix never !- Yes.
- 53. Q. There is no science required to repair such tanks. Would it not be better to let the people look after them themselves?—Formerly the outlom was to put three or four tanks in charge of each village and the villagers need to the rich the channels, and look after the lanks. But new that the one-anna cess is loyed, they will not do so.
- 54. Q. Would it not he better to redracthe assessment, and let them do it !-- I do not think so. They would let the

tanks go ta rnin. They would quarrel among themselves. It is better for Government to do the repairs, and raise the usual sessesment.

- 55. Q. Do you not think it will give a deal of trouble to Government to repair a large number of small tanks ?—I suppose there are only 30 or 40 tanks.
- 56. Q. (Mr. Ibbetson).—If the villogers did the repairs before, why did they not do them now?—The people are better infarmed now.
- The President read the following extract fram a paper cubmitted by witness on the subject of silting up of tanks.

# "(1) Baswannas Tank behind the Dharamsalla of Sampgaon.

The nrea of the tank is 16 neres and 32 gnntas and the area irrigated 17 acres and 38 gnntas. In years of ample rainfall, the tank has water up to February and rayats make use af it ones in Angust, if rain he nat sufficient and ones at the hegiuniag of October when the paddy crops come to core. Na repairs appear to have been dame to this tank by Gavarament. It is in a mast dilapidated state. Water stands only in one-third or so of its nrea. The rayats spend money only on removing silt from the low portion of the tank near the sluice. These repairs they do of the cost of 8 or 9. kudos of juari after an interval of eight ar ten years. The tank does not appear in the list of irrigation tanks.

- (2) Angdevarkari-
  - (a) Sampgaon, Na. 1, has an area of 4 sares 16 guntine.
  - (b) Guilavankeri, No. 2, has an area of 11 acres and 38 ganthas.

No. 2 irrigotes 17 acres, ond No. 1 irrigates 38 acros or they irrigate 55 neres and 16 gnuthas.

The area, viz., 65 acres and 16 granthes can be irrigated in years of emple minfall. Besidee, after taking out paddy, sugarcaue may be caltivated in about 25 or 30 acres of land nearer the tanks. In the rest of the irrigable area, avri is sown.

When petty ropoirs, such as repairs to the sluice or dome are necessary, rayal's concorned contribute for it. The expenditure incarred is about Rs. 12 in n year or every alternate year. The tack in energy Na. 124. vis., Gullowshkeri was, it is said, ropaired by Government in 1892. The rayals are said to have contributed Rs. 100. The dam is in disrepair. There is no pakke built sluice. The tank is silted up, and about one-third of it andy retaine water; and the result is that, out of the whole area, acres 583—7 gunthas ander the tank only acres 56 and gunthas 16 is irrigated. The tanks are estimated to require about Re 1,500 to Rs. 2,000 for their repairs.

## (3) Halladkeri Tank at Karambal, Taluka Khanapur.

The tank area is 3 acres, 17 gunthos, and the assessment is nil. There is an record to show when the tank was constructed, nar is there any record as ta when it was repaired; but it appears from what the village officers state, that it was anse repaired before the head-quarter station was transferred from Bidi to Khanapar, which took place in 1864. This tank was ogain repaired by the Public Works Department in 1899 at a cost of Rs. 2,280 castenth of which, viz., Rs. 228 was centributed by the raynts of the village.

# (4) Maharki Tank of Kupatgiri.

The tank area is 1 acre and 18 gontas of lond, if repaired. Now tha tonk is almost filled with sand and oan hardly irrigote 10 ocres, if rains are good. The tank was repaired by the rayate some 20 years age at the cost of Rs. 500, and was deepened. But in three or four years it was covered with sand. It cauld, when repaired, hold water 3 or 4 oubits, 18 inches high. It cannot now hold half as much. About 40 acres of lond under the tonk is used for paddy sawing. But it gote no water-supply from the tank, and consequently the produce is canciderably less.

- If the tank is repaired, the same land may be fit to grow sugarcane. All this land is assessed highly owing to the proximity af the tank, which practically is of no ase now to the rayats."
- 57. Q. (Mr. Higham).—You soy that a great deal of land is thrown out of irrigation by the silting up of these tanks?—Yos.
- 58. Q. The land has been oesessed of wet rates, and cannot got irrigation?—Yes; the people would have grawn sngarcane, if they could have got the water; but now they only grow paddy.

- 59. Q. (The President.)—Because the tanks are not Mr. Artal. cleared out?—Yos.
- 60 Q. (Mr. Higham.)—Can you toll me roughly whot 9 Jan. 02. the cost, per 1,000 cubic fact, would bo?—I as not toll the cost af 1,000 cubic feet; but it will cost Rs. 1,000 to Re. 2,000 for the remayal of the silt from a small tank.
- 61. Q. How many thousand outic feet could you remove for that sum.—I cannot tell—perhaps a depth of two ta five feet.
- 62. Q. (Mr. Ibbetson.)—How mony norce would each a tonk irrigoto?—About 5 to 10 acres.
- 63. Q. (Mr. Higham.)—Can you tell ma the cost per 1,000 auhic feet of alearance, if the work were given out by contract?—I cannot.
- 64. Q. It ecems to me that it would cost more to clear ane thousand enbic feet of silt than the irrigation it would give would be worth?—Yes.
- 65. Q. Have you any asses in which tanks hove been cleared ant in this way ?—No.
- 66. Q. I presume that the only remedy would be to raise the banks?—That will be more economical.
- 67. Q. You say that the Muharkhi at Knpetgiri would irrigate about 60 neres?—Yes; but it is silted up so much that it can only irrigate 10 neres. The cultivators spout Rs. 500 on it, and now it is able to irrigate 40 acres.
- 63. Q. If they spent Rs. 1,000 on it, would it irrigata 80 acres ?—I do not know.
- 69. Q. In the Khanapar talaka the Public Works Department built o dam across the stream of a cost of Re. 2,280; and, I balieve, that is since silted up. It damoged another village?—It silted up on occumn of the eand, and the villagers have now objected to it, os it spoils their laad.
- (Mr. Muir-Mockenzi etated that 23 lakhe will probably be epent by Government in the Bolganm, Dhorwar, Kanara and Bijapar Districts on the systematic repoir of tanks, in order to save loss of revenue.)
- 70. Q. I want your opinion on this. Granting that so much money is put at your disposal, for the repaire of tanks, would it be worth deepening the tank to provide extra eterage?—It will be more economical to roise the bonks, but the general belief is that weter evaporates and runs dry sconer in tanks where the eilt is not removed than where it is removed and consequently the tank deepened.
- 71. Q. Does any land owner ever deepen his tonk ?—Yee, in a clamsy way.
- 72. Q. I moke out that it would east Rs. 5,000 far every extra acre brought under irrigation, I want to know what you think about it?—I cannot say anything definitely shout it, but it would be much better to raise the embankment.
- 73. Q. Is deepening over done?—Yes; one man'e tanke are sometimes deepened.
- 74. Q. Yon say black action coll in this district is not suitable for irrigation, what do they enlivate on that soil?—Same sowcars in Dharwar and Navalgand tred ta irrigate deep black cottan call; but they failed to grow garden crops. Peaplo grow wheat cotton and juari in ordinary black cotton soil.
- 75. Q. You have black cotton ecil, which is not very deep?—In the Dau Valley the black cotton soil is soid to be 20 feet deep.
- 76. Q. Is there any black cotton eoil, which cannot be lrrigated?—The block cetton eeil in the Parasgod taluka connet be irrigated.
- 77. Q. (Mr. Ibbetson.)—Are you speaking of the whole district or of your talnks only?—Only of my charge.
- 78. Q. (Mr. Higham.)—With regard to the tank huilt by the Sir Dosai of Shirshaugi, has that been campleted?—
  It is not finished. The stone work has to be dane.
- 79. Q. Has water been let into it?—The tank is fall of weter. But the water has not been used, and no canale have been made. It silts up, as it is situated in a very sandy place.
- 80. Q. Does it eilt fast P-I think it will eilt up in 25 years.
- 81. Q. Has he spent more than the Rs. 75,000 advanced by Government, besides the Rs. 75,000?—He has epent Re. 20,000 to 25,000 out of his own pockat.

2 0

- Mr. Arial.

  82. Q. You do not think that he will make any profit out of it?—It will irrigats 1,000 acres, and, if he gots Rs. 10

  9 Jan. 02. The land under the tank is karal land.
  - \*83. Q. You say that there are a lot of places where the rayats make earthou dams across nallahs which cost Rs. 10 to 15 every year? Would it be worth Governments while te help thom to make bandharas?—Yoe, euch as are made iu the Nasik Dietrict.
  - 84. Q. Are any citos nvailable?—Yes, there are some small streams, snitable for bandharas.
  - -What about the rivers?-In Chikodi they have patasthal cultivation.
  - 86. Q.—How high above the bod do they bave the dame ? Five or six feet.
  - 87. Q. I enppose they run dry in the cold weather ?—They last to the end of February or March.
  - 88. Q. Hew many works of this kind are thore ?- Kot manr.
  - 89. Q. You say there are not many bandharas. Have you no idea how many there are?—I have eeen a few in Chikodi nad Sampgaon.
  - 90. Q. In your memorandum you refor to "other cources." You say 6,000 neres are irrigated by other sources?—Those other sources might be bandharas.
  - 91. Q. I suppose sugarcane is irrigated cometimee from these kacheha bandhs?—I have seen sugarcane watered by sups.
  - 92. Q. (Mr. Ribetson.)—You told us that where the survey system was introduced it protected the raynte against rey system was introduced it protected the hydrogams rack-ron'ting in Innu villagos, as the people were at the mercy of the Inamdar. Has the survey system been introduced into many villages?—The survey system has been introduced lately in the Chikodi talukee in six or seven out of 90 Inam villages.
  - 93. Q. It has not yet been introduced into half the number of villages? No.
  - 94. Q. It was done at the request of the Inamdars ?-Yes.
  - Mr. Muir Mackensie I think the total number of alienated villages was 59; and a survey hae lately been introduced icto most of thom
  - 95 Q. (Mr. Ibbetson.)—Has it been introduced into half?—I um not certain shout the number.
  - 96. Q. Have you may idea what the proportion is of the Inam villages in your charge in which the Servey Rules have not been introduced P—There is one village in the mpgaon talnka. I cannot give the figures for the other
  - 97. Q. You told no that the regards sowed engarcane in February, and trueted to early raine in April to water it. Yould the cultivators sow engarcane on the chance of rain coming at that time?—Sogarcane is sown in the rice areas on the chance of the water lasting. A hole is dug in the rice field, and the water is raised by sups.
  - 9S. Q. Broadly speaking what part of the district is most liable to famine?—The whole of Athni, some part of Gokak, Parasgad and ten or twelve villages on the northeast of Chikodl taluka.
  - 99. Q. Has there ever been n famine in the remainder of the district?—Not so fur as I know.
  - 100. Q. Was there a famine in 1896 and 1897 Pwes no famine in 1896, in Sampgaon there was a twelveanna crop.
    - 101. Q. There was a famino in 1876 ?-Yes.
    - 102. Q. And the scarcity in 1891?-Yee.
  - 103. Q. There was famino in 1899, and again last year so P-Yes
  - 104. Q. Where are the rico tanks principally eitnated?—The rice tanks are in the seeme parts, and not in the fumino parts.
  - 105. Q. Are there eny tanke in the inscence parte?-No.
  - 106. Q. And welle?-The whole number of the welle are in the secure parte.
  - 107. Q. You told ne that in many parts of the district, the extension of wells is not possible because you cannot get water. Where are those parts P—In the inecense tracts. get water. Where are those parts ?—In the inecenre tracts. They are in the southern pertion, where there is black cotton soil, and well irrigation is uet possible.

- 108. Q. Well irrigation is not possible on any very large scale in the southern portion of the insecure tract?—No.
- 109. Q. Is there any part of the northern pertion in which wells can be sunk?—About the nerthern parts I cannot say.
- 110. Q. You told us that it took from two to four menths to get a reply to an application for a takevi loau. You speak, I sapposo, of famino times.—How long does it take in ordinary times?—In ordinary times it takes from four to six months.
- 111. Q. What was the simplification of procedure adopted in the times of famines?—We kept an extra cetablishment, which made cummary enquiries.
- 112. Q. Do you think Government will lose much by the summary procedure adopted during the famine?—Yes, in Bijapur, I am afraid that in many instances Government will not be able to recover the advances.
- 113. Q. You do not think it would he safe to adopt a . summary enquiry in ordinary years?-No.
- 114. Q. With regard to the people keeping their own tanks in order, de you suppose that, if Government were to remit all the rovenue of euch tanks, as it does not intend to keep up, and banded them over to the raysts, would they keep them in repair?—No, they would not turn out to close them.
- 115. Q. And yet you tell us that, once upon u time, they used to turn out?—Yes, and they would do it now for old and respected village officers.
- 116. Q. Suppose we legislate to give civil officers power to call upon the people to turn out. Would that be u good thing?—Yes.
- 117. Q If you had that power, do you think it would be necessary to use it. Knowing you had the power, would it not induce the people to turn ont, without unduc presure?—Yes, in places where the cultivators are intelligent,
- 118. Q. I understand that rice is grown, without irriga-tion, except in a very dry year?—Yes.
  - 119. Q. Is that entirely in the eccure tract ?-Yes.
- 120. Q. You told ue about small earthen dams that the people throw across the nallahs, for which you think Government should give takavi. The earthen dams are washed away in the monsoon and so long as you have earthen dams they will be carried away year by year, and there will be no silting up; hut if you baild bandharas there will lo silting up?—When they build bandharas the people usually have one or two slaices.
- 121. Q. You said that the wells ran dry in Davi, that ie, the tract is which there was no sumine before?—Yes.
- 122. Q. Taking the cultivated area of the district what is the proportion of black soil which can be irrigated. Is it one-fourth?—Yos, about one-fourth.
- 123. Q. Is that in the conthern tract P-It is in the pure black soil country in the seuthern portion of the lusecure tract.
- 121. Q. Sappose a rayat berrows meany from the bania what interest does he pay?—He pays 12 per cent.
- 125. Q. Does he generally got that rate?-The rate varies and may be as much us from 18 per cent. to 24 per cent.
- 126. Q. Then is the 5 per cont., charged by Government, any obstacle?—I do not think so.
- 127. Q. Sapposo wo roduce it to 3 per cent. !- It would be a special encouragement,
- 12S. Q. Although wells cannot be mede in the inscence tracte?—Some small once can be made.
- 120. Q. Why cannot welle be made in the northern pertion of the dietrict?—There is no subsoil water. The people there sometimes have no water even to drink. They have to fetch water for drinking parposes from four or five milos.
- 130. Q. What is the ordinary period for the repayment of takavi loaas?-About ten years.
- 131. Q. Do you think that is enough?-Yee.
- 132. Q. Are there any compleints as to the shortness of time ?-No.
- 133. Q. So far eo I ean make ont, about 6,000 acree are irrigated by small earthen dams. Doss Government charge anything?—Nothing ee far as I know.
- 134. Q. What ie the patasthal ratof -The rate is lovied for eight or nine months and is included in the land revenue. I think it is about Rs. 2 an r.sre.

- 135. Q. Is it levied each year for all the lands netnally irrigated P-Yes, it does not vary from year ta year.
- (Mr. Muir-Mackenzie exploined that when a new bandhara is made it is inspected and the area which it can irrigate is marked down, it is the same in regard to a kachoha ar pakka bandhara end the assessment does not vary overy year.)
- 186. Q. You say that a man cannot build a kackeha bandhara without permissian P-In 1892 I enggested that a general permissian should be given.
- 137. Q. How long does it take to get permissian?—About 2 manths. I thought a good deal of tima was lost and so in the famine I issued a aircular letter giving permission to nee water from the streams without charge.
- 138. Q. Has a men ta make an application every year?—No, only ance.
- 189. Q. At present you have 6,000 acres irrigeted from these little etrane, suppose Government were to remit the patasthal rate and let the rayat use water without having te ask permission, would the area be largely increased, do you think?—Yes.
- 140, Q. Would it be doubled?—It might possibly be doubled.
- 141. Q. Is any af that irrigition in the insecure parts?
  -Na, it would all be in the secure part.
- 142. Q. In regard to small tunks are the bandhs generally in goad repair?—Na, they are being destrayed by neglect.
- 143. Q. Haw long has this been gaing an !-They have not been repeired in my generation.
- 144. Q. How much of the area irrigated has been reduced in consequence ?-Perhaps half the original area.
- · 14a. Q. Mastly rice tanks, I suppose P-Yes,
- 146. Q. Am there many private tanks?—These are called one-man tanks.
- 147. Q. De peaple still make these tanks?—No, net new.
- 148. Q. Why not, it is not, I suppose, because they are very exponsive F-No, they cost 1200.
- 149. Q. How many acres de they irrigate?—About 4 or 6 acres.
- 150. Q. Of cauo?—They would irrigate 1 or 2 acres of sugarcane.
- 151. Q. Have you had any applications for takavi for this kind of tanks?—Na.
- 152. Q. Why P-Because this area is not subject to famine.
- 153. Q. Take a rice field under a tank and a rice field dependent on rainfall, what is the difference in the crap?—The irrigated crop would be double that produced by the early rainfall.
- 154. Q. Is that because the rain fails or that a botter orap is produced P—I might give an instance. At Haldalheri the rayats got a double crop because they irrigated their rice fields from the tank.
- 155. Q. What da you mean by a kachoha well; one without any masonry at all?—Yes.
- 156. Q. Such a well might last 12 years f-Yes, about 12 years.
- 167. Q. If it is bullt up ou the mot side, how long will it last?—Thirty or forty years. They have such wells in the Chikedi Taluka.
- 158. Q. Are they showing signs of failing. Is there any reason why they should not go on for another 30 or 40 years?—I do not see why they should not.
- 159. Q. Wore many wells made during the famine ?— Yes, some new wells were made in the secure tracte and some were deepsned.
- 160. Q. Are many of the new wells still left kacheha? -- Yes, for want of funds.
- 161. Q. Suppose Government gave takavi, would they complete them ?—They have no scourity to offer.
- 102. Q. When a man builds a karkeks well and finds water, does not the land hecome more valuable as security?

  —Yes, but it may be already mortgaged.
- 163. Q. Dees not the Government claim take precedence?—The now rule is that Gavernment has no precedence over other mertgages.
- (Mr. Muir-Mackenzio explained that the rule referred to morigages in possession, and the question was

- under consideration in view of the heavy advences then Mr. Artal, being given.)
- 164. Q. (Mr. Rajaratna Mdlr.)—You just said that 9 Jan. 03. balf the area of the tanks has gone out af irrigotian. What is the probable less of revouse in consequence P—Ne less as the people pay the same revenue.
- 165. Q. Suppose the total area af a tank is 1,000 noies and it goes down to 500 acres, what would he the less of revenue?—Nanc so far as I know.
- 166 Q. Suppose the land is transferred to dry !—The water share would be about one fourth of the revenue. Tho loss would be ane-fourth.
- 167. Q. (Mr Muir-Mackenzie.)—The water share is 80 per cent. af the revenue under these tanks?—On the Maharki tank 40 acres have been reduced to 10, whereas the rayats are still paying full wet assessment though 30 acros have gone out of irrigation.
- 168. Q. What anthority have you for that statement P.—
  I was there yesterdny and I naticed that very little angureane was being grown, I enquired and got this information from the village officers and rayats.
- 169. Q. Was it last year only or is it a permanent reduction?—It is a permanent reduction.
- 170. Q. I think that will require very careful investigation?—The land was assessed for rice and not far sugar-
- 171. Q. (Mr. Rajaratna Mdlr.)—In the case of petty thinks, suppose a sub-Overseer is allowed for each talaka and a sufficient additional subtenent is placed with the Mamintdar, could not the repairs be arranged for?—We have a Sab-Overseer in Kanapur, but the difficulty is the rayats refuse to pay the 10 per cent. contribution.
- 173. Q. Supposing the 10 per cent. contribution was abolished?—Then the tanks would be repaired more quickly.
- 173. Q. Would you place any limit on the tauks yan propose to transfer to the Revenue Department?—I should say that tinks irrigating 5 acres and less should be transferred.
- 174. Q. Wauld yan go beyond that limit?—That question was considered by a Tank Cammittee in 1894, and they enme to the cenclusion that Revenue Officers would not be able to look after targer tanks.
- 175. Q. Would you not go se far as a 50-aere limit?-- Na, that is too large a tank-say 10 acros.
- 176. Q. You say that rice is grown in many parts with the aid of rainfall. Are such laids classed as wet?—Rice is grown by rainfall only in some meas which are alassed as Tari dry lands.
- 177. Q. In Kanapur there is a large area under rice cultivation, does it dapend on rainfall ?-Yes.
- 178. Q. It is stated that forest officers do not allow the rayats to take leaves for green manure?—Ries lands are not manured with gresn leaves. These rayats have a good supply of manure from their cattle.
- 179. Q. They have more cattle than the raysts in the red soil districts?—Yes.
- 180. Q. Do you know the Muchkundi tank?—I have seen it, but I know nothing about it.
- 181. Q. Do yan know the reason of its failure to irrigate the large area under it P—A suitable area is not under command of the tank. Some land at Bagalkot is irrigated by the tank.
- 182. Q. Yon stated that the Sir Desai of Shirangi was given a lean af its. 75,000. How was the menoy paid !— In instalments of Rs. 25,000.
- 183. Q. How long has the tank been under construction P-Since 1897.
- 183. Q Is the recovery to be made at once ?—No, about two years after.
- 185. Q. De you recover interest from date af paymont af instalments?—It is recovered in instalments, but it is calculated from a date to be fixed in this behalf by the authority who sauctions the leans, which is generally after not more than six months from the date of paymont of the lone.
  - 180. Q. Have ony instalments been recovered,?-Yes.
- 187. Q. What gnarantee have you that the whole of the money has been properly sport; has any special inspection been made?—He kept an account He is n respectible man and I accepted his statement. When I asked for an inspection of his account he handed it to me it once, and

Mr. Artal. I found that he had actually spent Re. 92,000 on the tank.

He omployed an Overseer on Rs. 30 per moath.

9 Jan. 02.

- 188. Q. In paragraph 22 of yonr printed memoraodam you say:—"that in years of droaght the collector should issue general orders permitting the free use of such water"; what do you meau? Is it always necessary to go to the Collector or Assistant Collector for permission?—The village officer doce not allow the use of water from etreams without the permission of the Collector.
- 189. Q. Has the Mamlatdar or the Sch-Divisional Officer no power to sauction it?—No.
- Umeer no power to sanction it?—No.

  190. Q. In paragraph 4 you cay:—"The Land Reveous Code adequately protects against any inture onhancement of revenue having regard to improvements effected in any land daring the currency of my previous settlements at the cost of the occupant or the holder." Are not the rayats protected against officement in inture revisions of the settlement?—They are protected against inture enhancement if they halld their own wells.

  191. O. (Mo. Dibeton)—Do the people know this?
- 191. Q. (Mr. Ibbetson.)—Do the people knew this?— Most people do. Only the ignorant Kundismoy not know
- 192. Q. (Mr. Muir-Mackenzie).—Gao yos explain the general ignorance of Teshildare and Mamlatdars regarding exemption on improvemente?—No, except that perhaps they do not study the Land Revenue Code.
- 193. Q. Yon are familiar with tals. You directed my ottention to thom in 1896-97 in the Taluk of Indi P—At Horti, I remember telling you ahout them.
- 194. Q. I want to know whether you consider these handhe are advantageous in famine years in affording the myst to grow some erop?—If there is no minfall they are
- 195. Q. But does not the soil behind these bandles retain moisture? Yes, that small area will be protected in a famios year.

- 196. Q. Do you consider that owing to the great advantage of these talls their numbers have increased P-Yes, about 10 per cent.
- 197. Q. How do they build them f—They borrow takavi. They spend some of the money for their own nso, and a whole family, men, women and children work on the tal.
- 198. Q. Do they make them of earth or stone?-Uoually
- 199. Q. I have seen stone once?—Yes, I know of a case in which a man has spent Rs. 1,000 and made a tal of otone with sinice gates. It is like n reservoir.
- 200. Q. The greater number aro not like reservoirs, they are intended only for a elight accommodation of water ?-
- 201. Q. Ic not the ecope for constructing those tals limited by the small eize of the boldings in many enses F—Yes, if a man wants to held a tal he would have to go through another man's bed in some places.
- 202. Q. The water spread must be in his own holding?-
- 203. Q. Why do people not huild more tals, is it want of money f-Yes.
- 204. Q. Then it would he a good object for Government to give liberel takavi for ?—Yee.
- 205. Q. In 1896-97 what was the extect of advances for this purpose as compared with wells?—For wells one-fourth; for tals, otc., thros-fourth; half of this was for nrms and the remoining half for deopening, etc.
- 206. Q. (Mr. Ibbetson).—Did I understand you to easy that where oultivators took tokavi for tals they employed their own lohour, and that for purposes of haiding tals in ordinary years takavi is not necessary. Then it is really necessary as famine relief f—Yes.

## WITNESS No. 76 .- MR. P. J. FITZOIBBON, A.M.I.C.E., Executivo Englineer, Belganm.

Mr: P J. 1. Q. (The President),-You are Executive Engineer Fitzgibbon. of this District !-Yes.

9 Jao. 02.

- 2. Q. How long have you been here?-For four years.
- 3. Q. I understond that you were here during the famine !—I was here during the famine of 1896.97; I was not here daring the recent famine.
- 4. Q. In what other districts have you served?—In cost of the Deccan Districts, in Gujarat and in the Konkan.
- 5. Q. Other witnesses here informed us that Athni, Gokak and the Parasgad talokas have saffered most from famine, especially Athnif—Proctically they were the only talokas which suffered.
- 6. Q. Athni was especially had? Yes, in Athni the people suffered very severely.
- people suttored very soverely.

  7. Q. Can you toll us what menns, you think, should he adopted to enable these talnkas to resist future famines. I would like you to take the talnkas one hy one. Take Athai first; hare you may promising tank schemes in vlow in that talnka?—In Athai I have a tonk schemos a viow. It is n rery promising coleme, and I am having it enveyed. It is near Kokatnor, and is at the junction of the two unllahs, its catelment area is 155 square miles, it will command a fair tract of land and will be as big as the Visupur taak at Ahmednovar. Ahmednogar.
- 8. Q. Is it a good site?—The tank hos just been surveyed. I have not yet had the onnel surveyed, but I have no doubt that it will command as much land as there will
- 9. Q. Is it one of the tanks mentioned in Mr. Beale's report on Irrigation works in the Bombay Presidency?—Yes, it is referred to on page 319 of the report.
- 10. Q. Has it been thoroughly examined yet?-I am having it survoyed now.
- 11. Q. And what do you propose to do for the rest of Athni?—I do not think there is mything else to recom-
- 12. Q. Can you tell ne something about the Tacsi tonk. I believe 2 lakes of rupees have been spent on it. Is it a hopeless project?—Yes, quite hopeless, it was not thoroughly examined hefore it was etarted.
- 13. Q. That was a fatal flaw?—Yes, there was no observe of fundations. We could not found the puddle

- trenches at 35 feet depth. We got to eand pockets and the filling in elipped away as it would in quicksand.
- 14. Q. How deep down did you get?-About 30 or 35
- 15. Q. Were any triol horings taken to try and find rock ?—No, we dog down to 35 feet and went no further.
- 16. Q. Concidering the great wants of the District supposing you were likely to find rock at 40 feet, was it worth while going down?—No.

  17. Q. (Mr. Higham).—Would you hulld a high dam there?—No, it is karal soil which is not suitable for a high dam.
- high dam.
- 18. Q. (The President.)—What about a masonry dam?
  —You would not get foundations, and if you get them at
  40 feet, the dam would be very expensive.
- 19. Q. The only reason I mention it is that apparently as regarde sitantica it is a very desirable project — Yee, so much so that I surveyed the canal for 90 miles to the boundary of the district where it joiced the Krishna.
- 20. Q. What was the otorage to be ?- I cannot quite remember, but it was a lorgo tank with a dam fof a mile
- 21. Q. Are you quite sure it is not worth going on with?—Yes, on that particular site there can be nothing hut foilure.
- 22. Q. Are there noy other possible eites?—At Sirnr-higher up where there was a site, the suil was worse still.
- 23. Q. I suppose you do not know of anything else that can be done for Athni taluku ?—I know of nothing else in can be done for Atini taluan r—1 know of nothing else in that part of tha district in the way of lorge irrigation works. We might do a good deal in the way of constructing puddle treaches across the larger milhals to hold up the sub-soil water. In 1896-97 there was a good supply of sub-soil water in the district, but last year there was cothing. The wells had to be deepened and the people were reached to make the contract had to a few water. very bodly off for water.
- 21. Q. (Mr. Higham.)—Where do you propose to put these puddle tronches?—At Visapur where the people were very hadly off for water during the first fumino year, I made a puddle trench across the nallah hed and in the second year of fumine the people had a oplendid supply of sub-soil water upstream of the trecohes. I then pat down Norton tobes in the river bed nod the wells in the nestream side got an increased oupply.

- 25. Q. What about thei Gokak Taluka ?—I think that the extension of the Gokak canal should be sanctioned.
- 26. Q Will you please tell as all about the Gokak canal, two of any members were not there yesterday when you took as ever the warks. What is the storage?—In the Gakak reserveir as at present constructed 900 million cubic feet is stored.
- 27. Q. You propose to have two subsidiary reservoirs in addition to raising the weir 7 feet. What would your storage be?—The raising by 7 feet would double the present eterage to 1,800 million cubic feet.
- 28. Q. Your two new subsidiary reservoirs would come above?—Yee, there will be two reservoirs and there would be a dam to each.
- 29. Q. What would they store?—The storage will be as follows:—At Hadalgi 3,000 millian oubic feet; at Aralgundi 4,300 million oubic feet and at Beniwad 3,122 (the latter is an alternative scheme is Aralgundi), altogether about 10,000 millian oubic feet.
- So. Q. This 10,100 millions of oubin fact besides the present reservoir supply of 800 million or after the present dam is raised, say nitogether semething short af 12,000 enbin feet?—Yes.
- 31. Q. What will be the full demands from the mills? —The mills require 136 enbie feet per second, and this for seven manths amonuts to 2,500 million cubic feet of the storage,
- 32. Q. That will leave 8,500 million enbio foot, nearly the whole of which can be elsimed for additional irrigation?
  —Yes, except what is lest by evaporation and percolation.
- 33. Q. On the other 'band, I suppose there is a good deal of water entering the reservoir up to a considerably into date after the monsoon?—Yes, we get the benefit of the streams. About 93 oubic feet of water per second is now running into the 12hupdal or Gokak reservoir, but we get nothing after March.
- 31. Q. That is n large ingredient to consider in connection with the storage of your reservoir?—Yes.
- 35. Q. I suppose in an ordinary monsoon season you would expect the reservoir to fill by the ond of the monsoon F—Yes, we have never drawn on the reservoir oven in the worst years before the heginning of Docember.
- 36. Q. How far down does your irrigation go?—The main canal is 25 miles, nad there are 12 miles of branch candl.
- 37. Q. What is the maximum area irrigated by the Gakak canal?—The irrigation on the Gakak bus been a little over 10,000 acres out of a commanded area of 17,000—more than 60 per cent.
- SS. Q. A very high percentage indeed?—The I brauch canal from which we irrigate runs along a ridge and we am irrigate the land on both sides.
- 39. Q. Was the proposed second section over begun at nll?—Yes, several lakes were expended on earthwork during the famine of 1876-77. It is proposed that Sentian II should be 58 miles long with a branch sention of 40 miles in the Mindhel State, a branch in the Jumklandi State of 40 miles and an extension of 40 miles beyond Mudhal to command the area in British territory in the Bijapur District.
- 40. Q. What is the sail all through that tract?—There is a good deal of poor soil. But near the rivers Ghatprabia and Krishna, the soil is black, while it is red on the ridges.
- 41. Q. Is it deep black cotton soil such as would decline irrigation?—In a year of good rainfall that black soil might refuse water.
- 42. Q. You have no fear yourself of the water not being taken for irrigation?—I think that they would take it largely in the kharif season for all lightlands, and in a had year for black soil as well.
- 43. Q. Doos your scheme embrace a tail reservoir that the waste water might be tarned into P—We have a scheme, but the conditions are uninventable, it would submerge lands worth two lakks of rupees.
- 41. Q. Da you know whether there are any siles in Hijapur?—I think they have been examined very largely. The difficulty is that banks of the rivers are very high and the channels very low.
- 45. Q. You think the whole country can be commanded with reservoirs and the storage tanks proposed in the ghats in cannection with the Gokuk extension project?—Yes, practically.

- 46. Q. Why can't yen go beyond Bagalkot with the canal?—With the praposed reservairs there will not be enough water for the whole of the land. Thecanal bosides cannat ga beyond the Ghatprabha in Bajapur where it joins the Krishna near Begalkot.
- 47. Q. (The President.)—Wa hope that it be people will show a better appreciation for the water at Bagalkot than the people de an the Muchkundi. Is that not due to the fact that the tank does not always fill?—Yoe, the people object to an uncortain supply.
- 48. Q. The rough estimate, I noderstand, for the Gokak extension is 91 laklis of rupees?—Yes, for the whole project
- 49. Q. How many years will it take to complete, supposing you had the money as fast as you can spend it to advantage?—I think it would take 15 years.
- 50. Q. You base that an the labour available?-Yes.
- 51. Q. But will not big works attract labourers from other districts?—Yes, but even then it will take 15 years to complete.
- 52. Q. Are the sites of the proposed storage tanks near the Dhapdal tank which we saw yesterday ?—Yes, Beniwad is within 10 miles, the second within 20 and the third within 30 miles fram the Gokak weir.
- 53. Q. All three are in the Belganm 'district?—They are within the limits of the district, but the Hudalgi submerges land entirely in the Kolabpur State and the Aralgundi partly.
- 54. Q. Would that be an insuperable difficulty !- No. I think it is only a questian of componentian.
- 55. Q. Now to go further south, what about the Parasgad talukn?—Before leaving the Gokak district I should
  lika to mention the project to nonke a tank on the Markandya. I should like to see a reservoir constructed in the
  Markandya river. It runs through a gorge which could be
  clauded by a masonry weir and would command a considerable area of land. It jains the Ghatprabha just below the
  falls.
- 56. Q. Is there any means of utilizing the waste water of the mille?—The waste water from the mille at Gokak caunet be utilized; the river is a sluggish and lies too low. There is a scheme in connection with the Chikuandi natitat. This scheme was mooted 25 years age. A bridge has since been built close to the sita and there would be some expense in consequence, as the bridge would have to be shifted and the read re-aligned. I am also deabtful about the foundations. The Markandya project would command part of the same area.
- 57. Q. The Markandya would take up irrigntion on the right and the Golak extension on the left bank?—Yes.
- 58. Q. How far cost does that Taluka go?—There are Native Stale villages which it touches.
- 50. Q. Have you had any consultation with the Excentive Engineer, Bijapur, about these projects?—No, the Executive Engineer, Bijapur, has not yot been consulted as to the Gekak extension project.
- 60. Q. In what time could you have the project ready for submission to Government?—I canuot promise it in any time, I have no leisnre.
- Ol. Q. If the Government gave you an Assistant Engineer and a survey establishment how long would it take?—With an Assistant Engiacer and a survey party a good deal could be done in six months. Of course ne surveys would be possible in the rains.
- 62. Q. A year hence, would the project be ready ?—Yes, a capuble Assistant Engineer could work it out in detail in a year.
- 63. Q. I suppose you look upon this as the most promising scheme in the district?—Yes, the only other large scheme is the Malprabha project. The river passes through a garge, and the idea is to huilt a high masonry dam, but this would submerge a tremendous area at laud. It is near Manoli (Navatirth).
- 64. Q. Yon have reported favourably on it, I understand?—Yes, on the site which is excallent; there is a garge 300 feet deep and very narrow, but the water cannot be led anywhere where it would be used.
- 65. Q. Do you know if anything can be done for Paraspad?—Paraspad is particularly hapeless. There is deep black cottan seil there. I have known it as deep as 100 fost. I built a wall recently near Parasgad 100 feet deep in a villaga in which there was no water, and there is not a drop in it at the present memont. It is situated in the south-eastern part of the taluka.

Mr. P. J. Fitzgibbon.

Mr P.J. Fitzgibbon, No.

- 66. Q. I suppose it is not a snitable place for wells?-
- 67. Q. If the Gokak extension were taken up do you think it would absorb the resources of this district, as regards labour f—Yes.
  - 68. Q. If it took 15 years to carry out it might prove a good form of famine relief work?—Yes, as far as the canalitself is concerned, but I do not see how famino labour could be comployed on the tanks. The northern part of Paragad is very rocky, the soil is red and there is no trap. You can go 60 feet deep through rock without getting water.
  - 69. Q. (Mr. Mair-Mackenzie.)—It is red rock of a par-ticularly hard kind, but nat trap. What do the people do to got driaking water?—They go 6 or 7 miles for it.
  - 70. Q. (Mr. Higham.)—What Is the amount of estimato for the Gokak extension scheme?—lias it heen regularly estimated or are the estimates only approximate? - The can'l may originally estimated for in 1808
  - 71. Q. And the tanks?—The tanks were estimated for at various stages in 1881 and 1896.
  - 72. Q. The amounts given in Mr. Beale's report on page 333 may be taken as fairly accurate?—Yes, they were arrived at in 1886.
  - 73. Q. Havo they been revised in may way since?-
  - 74. Q. Is there not a tendency naw to raise the refer then fixed ? No, the rates, if anything, have been reduced for masonry.
  - 75. Q. Before the project could be sanctioned, the details would have to be norked out?—Yes, the figures would have to be recast. The and compensation, which is much hervier now, would affect the question much more than the question of mice.
  - 70. Q. Have trial horings been made?-Trial pils were taken down to rock.
  - 77. Q. On the regular tengitediant section of the dain's
  - 78 Q. Merely a general estimate, I suppose, has been made for the work?—Yes, lump sums have been estimated for each outlet.
  - 73. Q. What about the wolfa ?—They are subsidiary neirs to act as water cushions. Except the Aralgunds, the dam of which is proposed to be of earth, the tanks at Bankand and Hadaigi are to be mannery, and the saver will flow over the top like the Golak were.
  - 80. Q I suppose no diamings have been norked out?-
  - and, not in any decime.

    81. Q. Supposing it was decided to carry out this 91 lists project which would take 16 years to complete, 1 suppose the dam could be carried out and brought into me gradually. For instance, you have a lot of Marrie trigger tion on the Gokak, could you extend that strigation at once by constructing this section No. 2 of the Gokak canal?—Yea, the work could be done in sections and we could increase trigation at once.

    82. A mediated that were an increase the first of
  - 82. Q. I understand that you can increase the kineif irrigation without any storage tracks so that as you much each weir you can extend largestion. So that you can ready start irrigating additional areas in the next two or three jears !- Yes.
  - So. Q. I cannot find that any allowance less Leen made for the lass of water.
  - (To Mr. Beale.)—I think there must be same mistake in the figures on page 331 of the Report on Bomb or brightion.
  - Mr. Bode explained that allorance had been made for less of rater in the 200 miles by taking 12 arresport million for the first achiene instead of 18, and less for the second and third schemes
  - St. Q. Is the loss on the present canal considerable i-Yes, it runs through muram.
  - 85. Q. The near can'll would irrigated the same kind of soil me the present canal?—No, not all through, some is black cotton soil.
  - 86. Q. You say the compensation will probably be much more than formerly f-Yes, as two of the tanks will have to he lu Kollespor territory.
  - 87. Q. The Aralgundi will be partly in Kolhapur F-l am rather to favour of the l'enimed and Itadalgi reheves. Hadalgi is entirely in the Kolhapur State.
  - 88. Q. Have you taken up land before for tank- in a Katire State?—Yes, the Bhatgarh tank is to the Native State of Bhor.

- 80. Q. Has the Kolhapor Sinte been approached on the subject !- There was some correspondence, but nothing defi-
- 60, Q. Why should not the composition take the form of an annual charge on the land taken up instead of purchasing it outright?—In an aimid I um not competed to ansuer the question. I do not know if the land could be rented from the Kolhapur State. I dare say it coold be done.
- 91. Q. Would it involve a transfer from the Secretary of State?—I know that the land through which the Porlyar rous in Travaurore is only routed from the Mysero State.
- 92. Q. I thought that was the case also at Bhatgarh.
- Mr. Bealo explained that the land at Bhatgarli has been
- 03. Q. Apart from the Gokak can'd the most promising schone is, I believe, that proposed at Kokatnur P-Yes, Kekatnur sceme a promising scheme.
- 81. Q. Do you think it should be carried out ?it might be extrict out as a protective work. It would not do as a productive work, as much of the command as black soil out a good doal of the water would not be used in good years.
- 05. Q. What would it cost ?-The cost would be about 0 or 7 lables. The height of the dam would be 40 feet.
- 116. Q. The work mughl he planned out and kept ready as a famino work?—Yes; It would be a very useful fanding
- 17. Q. Are there any other tank projects which soight be treated in the same way?—If the Durdandi is to be carried out, the earth dam could be made by tamino labour,
- 99. Q. Conkl not flamine labour be employed on all of them with advantage?-Nu; the Markandya would be a mesonry dam.
- on, Q. That might wait till you finish the Gokak extension. It must stond on its merits !- Yes; I think so.
- 100. Q. It has been reported that you have repaired 35 of the small tanks to this district i-les; the number must be 50 now.
- 101. Q. And wane 400 remain in he done, what are the 101. 13. And there of the reflected re-We have some 410 of our lands. There small tanks are without waste weirs and have no outless, there is seldem any pitching, and in some cases the data have been breached.
- 102. Q. What is the average height? Maximum about 30 feet, aremise about 29 feet.
- 103. Q. They bit up a good deal, I sappose. Hare you attempted to clear them f-No; I have raised the dain 2 feet and find that is the chespest way. That sometimes me as submarging good land leyond.
- 101 Q. Are any objections made against raising the dame, and submerging lands?—In some cases we have to pay land compensation. The people in this district are very land-hungiy.
- 105 Q. I should have thought that in small tanks like there, compensation would not be necessary fully some cases the people are not compensated. They can then cultivate only in the call senson and to lose the more valuable. " (110) (10).
- 106 Q. Do you buy the land out?—My plan is to pur-clase the land and then resell it.
- 107. Q Would it not suffice to pay compensation for the last of a crop and leave them the land to make what they can from it?—No; we generally have to purchase the land.
- 16%. Q. Whot advantage does that have over paying computation for loss?—We probably get a better largein.
- 100. Q. The alternative would be to acquire the land?— They make untrescondle demands when I offer compen-sation for loss, but when I want to purchase they come to
- 110. Q. When you raise the dams you have to purchase the land?—Not always. The rayats sometimes come forward and say "raise the dam and we will pay the land compensation." We, however, cannot accept more than 10 per cent of the cost of repairs. We might leave them to wettle the compensation with the owners of the land that it little to a subpressed. is likely to be submerged.
- 111. Q. The repairs consist of raising the banks, making waste were and repairing the outlets, where necessary?—Yes, sometimes also the water level has been low fee a very long time the Revenue trepartment lets out the land under the tank to a cultivator, and then, when, I raise the dam, I have to acquire the land.

.112. Q. The moral is to let them make their own arrangements P-Yes, but if we do not restore the tank we have got to give up the nesessment.

113. Q. Have you given up the assessment in many cases in this district P—No, not to my knowledge.

- . 114. Q. Suppose the water level falle, you do not give up the assessment, but let the land to mether cultivator. F. Yes, but this could only be done at dry orop rates.
- 115. Q. Do you let the land?-No; the right of oconpancy is sold.
- 116. Q. What shout the Gadikeri Tank?-It is a large second claes work.
- 117. Q. Has anything been proposed in connection with improving it? —It cannot be improved, it irrigates all the land it is possible to irrigate.
- 118. Q. What about the silting up of the small tanks?-
- 119. Q. What is the ordinary life of one of those touke?—Most of these tanks must be 100 years old.
- 120. Q. I suppose they have got u lot of silt in thom?-
- 121. Q. (Mr. Ibbetson.)—You say that in 1896-97, there was a good supply of sub-seil water in Athni and good food crops were obtained under wells, but that the water went down considerably by 1900, due to a succession of dry reads?—Yes. Jears ?-Yes.
- 122. Q. Is there much well irrigation in Athni?—There is a fair amount, but it is diminishing a great deal.
- 123. Q. In ordinary years those is a considerable amenat? -Yes; the people thoroughly understand wells.
- 124. Q. Do you think that the aren under wells could be increased?—Not under present conditions.
- 125. Q. Supposing the out-soil water rises again?-If the sub-soil water rises again, there would, I think, be a . large increase, owing to the amount recently spent on
- 126. Q. Is there any considerable portion of the talukn where wells cannot be made?—There are, I chould say, no parte unfit for wells, except near the Krishua, where they are not required.
- 127. Q. What is the ordinary depth of water P-In 1896-97 it was 30 feet.
- 128. Q. Is all the soil fit for irrigation or is there a good deal of deep black ootton soil?—There is some deep black soil on the Krishnu, but in other parts irrigation from wells would be profitable on block soil.
- 129. Q. What are the chiof crops irrigated ander wells?

  Junti, maize and fedder for eatile also wheat and sweet potatoos.
- 130. Q. Is that in ordinary years ?- I am speaking of famino yenra.
- 191. Q. What do they grow in ordinary years ?-Garden crops, sugar-cane, etc.
- 132. Q. If the area of wells were extended, would manure and capital be available?—There is not sufficient manare in the country. It would be a good thing to import fish manare. I have spoken to the people, who say that they
- 133. Q. Are the people of this district fairly well off P-Under the Gokak count the people are well to do new-ndays.
- 134. Q. I mean apart from the canal tract?-Athni is nlinost depopulated, 40 per cents of the people have omi-
- 135. Q. (Mr. Muir-Mackenzie.)—Was there a large decrease in the 1901 census from 1891?—Yes, a considerablo doarense
- 186. Q. (Mr. Ibbetson.)—The place is quite reined?—My present experience in Athai is that there is great difficulty in obtaining male labour, only the women ure left, but with a couple of good seasons the taluka would recover very largely. The Krishna fleede considerable areas.
- 137. Q. You have, I dare sey, bad a good deal of experience in sinking wells !—I have sunk 30 or 40 wells in this district.
- 198. Q. On account of the Public Works Department P-No. generally on account of Local Boards, I am new constructing some for the Local Board.
- 139. Q. What do these wells bost?—Some have cost lte. 4,000, same can be made for R500.
- 140. Q. Under what circumstances would wells costing R500 or R600 be possible?—Where you can get water, without having to excavute largely in rock, ut a depth of

- 141. Q. Are those conditions at all common in the district?—Not at present; they were before in Belgaum.
- 142. Q. And in the lascoure part?—In Parasgad the water is ecidom.less than 80 feet down. I have had to go down as much as 110 feet. In Athni it is much nearer.
- 143. Q. In Athni, could u pakka woll be built for R500 or R6:09—A pakka well there would cost R1,000 with masonry on the mot side.
  - 144 Q. Have you any experience of dry masonry wells?
    -Yes; I built one in my own compound here.
- 145. Q. Do you know how it would last us compared with lime masenry?—A dry masoury well abould last as long as a well built with line masoury, but the thickness is about double, viz., 2'—6" against 1'—3" except with laterite which is easily dressed.
- 146 Q. Which would be the cheapor in the ond?-Lime masoury, except in laterite, where you can have a thin steining.
- 147. Q. One well would last as long as the other; that is almost indefinitely?—The fault is that the people build them round instead of equare. Round wells are better.
- 148. Q. Round wells built with masonry would lust for over ?—Yes, practically for over in hard trap; in laterite I would not give any guarantee.
- 149. Q. Woald it be safe to assume 50 years us the life of a well built well?—Fifty years would be a very safe figure, it would last for more than that; even 100 years would be a safe figure.
- 150. Q. At any rate 50 years would be quite safe?-Yes.
- 151. Q. By a well built well, I mean such u well as a rayat would build?—As a rule the rayat uses very bad stone and werse mortar.
- steac and werse moriar.

  152. Q. Take the ordinary rayet who will not use very well dressed stone and uet first class mertar, would it be too long to assume that such u well would last 50 years P—If built circular and twice as their as I chould make it, it would be safe to assume 50 years us the life of such a well, if founded on rock and not on muram.
- 163. Q. Wolls are generally built on rock in the Decom P-Yes; but in other cases I have reached no foundation after going 100 feet deep. I have built a well in Parasgad on curbs. At Yedravi, there is a well 100 feet deep, founded on a curb, without any water. I have brought water down into a cistern in this yillage from a cave upon the hill above it.
- 154. Q. What do the curbs rest on ?—Some rest on an alluvial deposit; here in Bolgaum it is a kind of other olay, and in Parosgad black soil. We have a great variety of soil in the district.
- 165. Q. I suppose the life of these wells is very procarioas ?-Yes.
- 156. Q. Is all the available water on the Gokak canal used overy year; is the demand is excess of the supply ?-
- 157. Q. Even in a year of good minfall ?—Yes; even in years of good minfall. But somotimes we might got eciao water we cannot count on by thunderstorms.
- 158. Q. It would not be for want of demand that you would not use all the water available ?—No; the demand is in excess of the supply.
- 159. Q. What is the proportion of cane irrigated ?—The proportion of cane to other crops is small, because in the hot weather I have only 6 onbie feet per second of water to
- 160. Q. You can give an eight-menths supply, I suppose P.—To a limited extent only. I have to husband my eapply so as not to draw appen my reserve for the mills. The proportions of irrigation to the various crops are as

Perennial 2 per cont. Kbarif 16 per cont. | Rabi 49 per cont. Kbarif 25 per cont. | Mensoon 83 per cont.

- 161. Q. What crops do the people irrigate in the men soons?—They grow juari, bajri, kulli, ragi, tur and chilliee.
- 102. Q. A good deal entered under menseeu erops is really garden erops?—The principal four-month erops are onious, garlic, etc.; they grow them even in the rabi conson though they are four-month crops. In the measure we charge them rabi rates as well as in the rabi conson.
- 163. Q. On your caush how much of the rabi onlivation is ordinary feed crops and how much high class crops ?— Is orthany accuracy and now much might chose orops re-Fifteen per cent. is gardon creps and the other 85 per cent. cerculs—millets und pulse. This has been the proportion in mererecent years, but in other years the propertion of

Mr. P. J. Fitzgibbon. 9 Jnn. 02.

9 Jnn. 02.

Mr. P. J. garden crops to dry crops is 30 per cent., ugainst 70 per cent. Fitzgibbon. The uverage for 10 years is 25 to 75.

164. Q. Yon say that you refuse applications for garden craps. Are these applications submitted every year?—I refusa paronnial crop applications, but up to the present I have not refused garden orope.

have not refused garden orope.

165. Q. Suppose that a man has a field of junri and he puts off upplying for water on the score of sxpanse till the vory last moment, if the permit does not come until after 10 or 14 days, he may lose his crops altegather. What does he do then?—The enlitivator takes the water und sends in his application afterwards. I have fixed dates beyond which no man may take water without heliog charged danble rates.

166. Q. In that case they take the water without leave. Then, what is the object of the application?—I cannot prevant them taking the wuter.

167. Q. It is not by your permission that thay take it without wuiting?—They take it before they get permission.

168. Q. Thut is, in offect, that they help themselves to water, whonever they want it?—Yes.

169. Q. What is the use then af having the application eystem ut ull?—The application is a check on the establishment and prayents surreptitious watering escaping attention.

170. Q. They would have to pay any how?-We would not know when they took the water.

171. Q. If a man were going to take water illegally, do you think he is going to tall you 4—No, but if he is found out he has get to pay double rates.

172. Q. We have been told that the reason for the application is that you knew the demand you have to meet and how much you can guarantes. You want to know how much you can pledge yourself to supply?—It would come to this if we did away with the applications: the people might exceed the limit of the water-supply.

173. Q. I suppose yan have some system of ratation; could not restriction be upplied by outting off the supply for longer periods?—I could not regulate the unmaunt of for longer pariods ?water ta ba sent down for may accison.

174. Q. Yon mean you might send dawn more water than is wanted?—Late rains come in October, whon the mbi crop is sturting, and we would be very much in the dark as to what the cultivators were doing.

175., Q. Ydu enn tell whothar a field has been irrigated and how much water has been used ?-No, you might get a shower in between.

176. Q. Do you know that the whole of the area in Upper India is so irrugated ?—My experience is that you cannot tell after a week, especially if rain has fallen in the interval.

177. Q. You trust to the peaple applying is order to render thomselves liable; that does not seem to be a sound system?—The rayats always are trying to get the better of you.

178. Q. You do not think that the system of application could be abolished !—If you dld, the revenues of the canal would suffer.

179 Q. Do the people take water without permission and pny donble rates ?—Yes, thay take a good deal, they do not mind the double rates.

180. Q. What is the praportion of the area on which tha peaple pay double rates?—About 5 per cent.

181. Q. 1 understood that vilingo tanks are at present divided into second class irrigation works, which are maindivided into second class irrigation works, when are infinitional by the Public Works Department, and other tanks which are managed by the Revenue authorities?—No. There are three talukus in which there are such tanks. There are 410 tanks, excluding the inaudars and 'ana-man' tanks. All these tanks pro entered in tha list under the scheme far repairs. They are all liable to ha repaired by this Dopartment.

182 Q. I am speaking of the prescribed classification ?-There is no limit as regards siza.

183. Q. Do the present orders as regards repairs of tanks include all tanks?—Yes, all tanks, with the two ex eptlens named, have to be unintained.

184. Q All have been brought under the echema for repairs?—Yes.

186. Q. (Mr. Higham.)—Even those under fifty acres P— Yes; what I do, whou I get an application from a number of rayats for repairs to their tank, is to see if the cost of repairs is less than tenyears' revenue. In that casa I apply to tha Collector, and, if he approves, and I find that there is a bulance in the allatment for repairs. I pat the work in Collector, and, if he approves, and I find that there is a bulance in the allatment for repairs, I pat the work in haud after the estimate has been sanctioned. When it is repaired, I hand it hack to the rayats to mulutain. I keep an eya on tha tank, and toll them that they must keep it in repair. And if they do not do so, I repart the case to tha Collector, who, hawever, tells me that he has no legal power ta force them to repair their tank. Sometimes I egain repair the tank, und usk the Callector to recover the cost.

186. Q. Has it been colleated ?-Yee, it has been in some

187. Q. (Mr. Ibbetson.)—Do you think that Government should legislate to give the Collector power to get these small repairs carried out?—I do think so.

188. Q. (Mr. Rajaratna Mdlr.).—You say that the rayats are allowed to take water without previous uppliestion ?-Yss.

189. Q. Is that confined to any partianler work, or is it a general rule ?—I have only one canal nuder maund my statement is confined to that.

190. Q. The messnrement of the irrigated urea is donoby a measuring staff. Is there may check on them?—Yes; the Snb-Divisional Officer une to check 10 per cent., and I sheck some myself.

101. Q. Is there any roam for frand?—Yes; I have found that lerga ureas have not been measured stall. In ano case, two years ago, we found that a measurer had taken 3500, and let off land on which the water-rate would have been R1.100.

192. Q. Ho takes his 10 per cont. ?-Yes, and very often

193. Q. Whet is the runge of a Divisional Officer?--About 12 miles.

191. Q. What is the range of each measurer?-We have two measurers, and does 6,000 ueres and the other man 4,000 acres, but he has ather duties in addition.

105. Q Could not an urrangement be made with the rayats to sattle the nrea of permanent irrigation?—I had stones fixed for the sub-divisional numbers so us to obviate measarement, but I found that the people moved the stones.

106. Q. Is there no Baundary Aat?—Yes, but that does not dotar them. It does not apply to stones fixed by the Public Warks Department.

107. Q. Canld not the Survey Department demarcate the houndary, and they would than he limble to proceedint P-Yes, but that will require same consideration. As the stones were being constantly moved, I stopped the system of sub-divisions.

198. Q. In regard to petty tanks, da you take them in hand and repair them as required, or do you wait for the rayats to apply?—I prefer to do the tanks for which the rayats' upplications are submitted.

199. Q. (Mr. Muir. Mackenzie).—Yau have not found the 10 per cent. contribution system on obstacle to your spending your full ullotment for repairs?—No, the royats have in every case contributed the 10 per cent. The allatments are not large. They only average R15,000 u year.

200. Q. (The President).—If these tasks are scattered, the Pablia Warks Department cannot cantrol the wark on them very well?—In my district the tanks are in a compact area; there is some difficulty with the laborers sometimes.

201. Q. (Mr. Rajaratna Malr.),—How many one man tanks are there in your district?—I counct say.

202. Q. Is the number large?-I bave no idea. They are not in our lists ut ull.

203. Q. Is any reduction of assessment granted to a man who owns coah a tank?—I do not know, the Callector can answer that question.

204. Q. You have referred to oircular and square wells; what is the increased cost of a circular well as campared with a squara oue ?-The circular one is less costly.

205 Q. Would not the stanes require to be properly dressed . for n circular well? - Evan then the cost is les-

206. Q. If the rayat finds they cost less, why does ho nat build tham?—They would prefer them, but they do nat understand how to build them. An ignorant man aan build n square well. Some skill is required to build n oirenlar one. Skilled labour is nat available. The rayat may make n raund well that will last 10 years, but I refer to the well which would last 50 years.

207. Q. Referring to the Gokak canni, what area coold be irrigated by tha supply now give to tha mills?—It depends an tha distance from the tank. I think the supply given to the mills would irrigate 30,000 acres, on the basis of the present 20 cusees mighting 5,000 scres.

208. Q. Would it be possible by some contrivence to bring back the supply from the mills to a reservoir?—Not unless year pump it. The fall is 180 feet.

209. Q. As regards the proposed extension of the canel, will that increase the area and the revenue?—Yes, 24 per cent would be the return on the large, scheme which will cast 91 lalhs.

- 210. Q. What sum has been spent on the Taosi tank?—R2,33,000 altogether, including land compensation. We have sold back the land since.
  - 211. Q. How much did the land fetch? -I do oot know.
- 212. Q. Wore not trial borings taken?—Trial pits were made, but no berigs. It was started in a hurry during the famine.
- Witness to President.—I would like it placed on record that I was very strongly opposed to the ctarting of the Tansi tank project.
- 213. Q. Are you familiar with field bunds or tale?—I have seen many tale, but I have never built any.
- 214. Q. Could a survey neefally be made in the interests of the rayats in regard to works of thet description ?-Yes.
- 215. Q. Woald you utilize fomine labour on them? -No, they would be too scattered. They ought to be put under Civil Agency.
- 216. Q Would you have those tals designed by skilled agency?—Yes, one plan would do for all. I would have the sites fixed by curveyors employed under the Collector.
- 217. Q. Do you think that the programme of tal works might be drawn up in time to be included in works to be carried out by familue labour under Civil Agoncy?—You. The best kind of Civil Agency works would be the building of tals.
- 218. Q. Do you think that they could be utilized to a sufficiently large extent to supersode large Pablic Worke in the famine?—I do not think so.
- 219. Q. Do yon think that they should be creeted on private lands and thet the owners should pay something as they do in the North-Western Provinces where they are called "nidel works"?—It might be considered.
- Mr. Ibbetson.—I do not think it would work very well. The conditions are different in the North-Western Provinces; there are big zonindars.
- 220. Q. Do you think that offerts might he made to extend fals as a protection against famine?—Yes, with the help of takavi a great deal might he done. But in this district they have exhausted all the takavi. There should, I think, he some law to enforce that the money advanced should be open tou the object for which it is granted. There ought, I think, to be a special establishment to look after takavi leans.
- 221 Q. (Mr. Ibbelson).—You are reforring, I suppose, to taken given out in famino years?—Yes; there is no record of the original condition of the well to be improved.
- 222. Q. In the observation of crops you uppear to have two classes, viz., monsoon ribi and het weather rabi. Can you give any idea of the relative proportions of the two classes?—We have practically us hot weather rabi crops.
- 22B. Q. Thou it may be taken generally that all are monsoon-rabi crops?—Yes.
- 224. C. Under monsoon crops you have two classes, vegetable and millots; I suppose the greater propertion is millete ?—Yes, quite 70 per cent.
- 225. Q. (Mr. Higham.)—To come back to the question of applications, I con quite understand that you require applications for rabi perconial crops in order to regulate the distribation of your eterage. But I understand that the only object of having applications during the monsoons is to provent the concedenat of irrigation?—I was speaking of the Gokak canal; as regards the mouseon crops, the object is to prevent illied irrigation.
- 226. Q. You have a Revenue establishment to that each outlet gots its turn for a prescribed time. Could not that establishment, during the kharif season, instead of troubing about how the water is distributed take a note of the fields irrigated?—The establishment of Patkaris gots only 127 a month cuch, and excepting the head Patkari and two measurers, the men are illiterate.
- 227. Q. Are they so illiterate as not to be able to do it in their own way?—Yes, they would have to find out the Survey No. and get the map to do the work properly. They are too illiterate for that.
- 228. Q. Sopposing the rule that those tacks the enucre of which contribute 10 per cent. towards the repairs should be taken up first, were done away with, how would you determine the order in which tanks should be taken up?—I would take up those tanks most in need of repair.
- 229. Q. Could you personally investigate which are most in need of repair?—I could do so during my anunal luspection, and would give orders accordingly.

- 230. Q. Supposing a new man came to this district, he would have your netes; but he would have to depend on the subordinate establishment?—Yes, I would call on the Revenue officers for records.
- 231. Q. Seppesing you had R3,00,000 to spend oo theso works, would you have much difficulty in determining which should be repaired first?—The tanks I have repaired so for have generally been the large ones. The others may often cest mere than 10 years' revenue.
- 232. Q. But aport from that, could you repeir them all at once; say some this year and some next f—There are very few deteils and it is hord to get information.
- 283. Q. There is no systematic record kept of information regarding tanks?—No there are no records.
- 234. Q. (Mr. Muir-Mackenzie).—You were once stationed at Ahmednagar and you are familiar with the Visapur tank. Do you think that thet project should be completed or left?—I know the Visapur project, as I practically began it. I have never surveyed the canal, so I would rather net hazard an opinion on the advisability of completing or leeving it.
- 235. Q Do you think it will fill ?—Yes, I think it will fill with \$\frac{1}{2}\$th of the run off in average yours.
  - 236. Q. And in bad years ?-It would not fill.
- 237. Q. What is the doubt about the canal; is it because the laud is not well suited to irrigation?—I think it is very well suited to irrigation, but a good many of the land owners would not take water in ordinery years. It is in the Bhima valley, and if the people get a good rainfull they would not take the water.
- 238. Q. Assuming that you had the water which now goes to the mills at Gekak available for irrigation, and you could irrigate, as you say, 30,000 ceres, would that be principally mens oo crop?—I meant that I would be able to irrigate 30,000 acres outside the monseon season—30,000 of rabi crops. Perhaps 20,000 would be nearer the figure, as we should have to draw off sooner.
- 230. Q. (The President).—On page 13 of the Report on Irrigation works, Bombay 1901, it is stated "In 1896 Mr. Ployford Reynolds as Executive Engineer for Irrigation. Dharwar, suggested the construction by famine relief labour of dams without elaborate arrangouente for water tight foundations. A note on this subject by Mr. Dunn, Superiateuding Engineer, Public Works Department, is attached. It is now suggested again that certain tructs of country would beaefit by the construction of what may be called 'kacheha tanks' formed by bunds, suitably drained to avoid slipe, but with no puddle trench. The fenction of such bands would be to heed up the water for a period and let it escape gradually, thus raising the surrounding aubscul water level and producing a small and more permanent flow in the nallsh below." I sappose it is something like a fal, only on a lorger scale. I notice that on page 15 of the same report you say:—"I believe there was considerable correspondence initiated by Lord Hurris' Government in 1892-93, or thereaboute, on the subject of raising the sub-soil water level in wells by means of what are called kackeha tanks in your note, and the conclusion arrived at, I understend, was that the results would be incomment surato with the cost." Do you know whether such knockeha bunds were made anywhere f—No; nothing more than a tal.
- 210. Q. I gather that something larger was contemplated—such a band as would retain water for a considerable period when the meason is over. It would not do to put a dam in a nallah as the force of the water would corry it away?—There would have to be made prevision for a waste were.
  - 211. Q. That would be expensive ?-Yos.
- 212. Q. (Afr. Ibbetson).—But you save the cost of a pudilie trench?—Yes, and you can make them where you have not get sufficient material for making a tank.
- 243. Q. (The President).—It would raise the sub-seil water level and the supply in the storage would also be kept up?—Yes.
- 244. Q. I think it would be a form of work which might be useful, and it is not oostly. Probably the bed would be used for cultivation after the water has been drawn
- Mr. Muir-Mackenzie-Such a tank would be empty every year.
- 215. Q. The water would probably percelate away by Christinas overy year, but some orep could then be grown in the bed, do you not think so?—Yes, I think it is worth trying.

Mr. P. J. Fitzgibbon.

#### WITHESS No. 77-Me. PURSHOTAN YOGHANDRAFPA PATIAVALI, Gokak.

Mr. Patiavali.

9 Jay. 02.

(Examined through an Interpreter.)

- 1. Q. (The President).—You are a landowsor in the Gokak Taluka !—Yes.
- 2. Q How much land do you irrigate ?—I irrigate 100 acres, but if the Gokak canal is extended I can irrigate another 150 acres. I own 250 acres.
- 3. Q. What do you oultivate?-Maize, chillies, juari and sweet pointocs.
- 4. Q. Da you grow crops all the year round?—Yes, I grow juari (kharif) every year. I irrigate it in years of drong bt.
  - 5. Q. Do you irrigate rice ?-No.
- 6. Q. Why not ?-It requires much labour and plenty of water.
  - 7. Q. When is rice eropped ?-On 15th Octaber.
- 8. Q. Would not you be able to give the erop plenty of water till thee?—Yee.
- 9. Q. Then why do you not irrigate rice? Becouse the staple food of the dietriet is juani. Some people irrigate rice.
- 10. Q.: If you irrigate the wholn of the 250 acres could you get sufficient manure? -I am afraid I could not.
- 11. Q. Then, without mnaare, it would be useless to irrigate the land ?-- Yes.
- 12. Q. What mounte do you use? -- Cow-dung and sheep manure.
- 13. Q. Da you find that you can get water when you want it?-No, the water-cupply is scanty.
- 14. Q. If you irrigate 100 aeres out of 250, can you get the necessary manure?—No, I grow only 50 acres of crap, because I cannot got the manare.
- 15. Q. (Mr. Higham.)—When you make an application for water, do you got it?—June 15th is the day fixed for application for kharif crop; but the application hos to be made before that?
- 16. Q. Do you always make it before that !-Yeo.
- 17. Q. Snppose a man wishes to irrigate his field after that date, what happens?—Ho will have to pay double rates.

- 18. Q. Do many people apply after the date fixed ?—No, they apply before the date fixed. No applications are filed after June 15th.
- 19. Q. Then if a man wants water ofter that, he would take it without applying ?—Yes, hat he would have to pay double rates.
- 20. Q. Are there many people who do that?—In a year of drought, when the people fear that rain will not come in time to save their crops, about 40 or 50 people would do co.
- 21. Q. Suppose o man applies for water, and then changes his mind, and does not irrigate his field ?—If he does not take the water, he is not charged.
- 23. Q. What is the date for applications for rabi crop?—15th October.
- 23. Q. Do the people know the date?—Yes, previous notice is given to the owners of land in each village.
- 24. (Mr. Rajaratna Mdlr.)—Is this notice issued overy year?—Yes, anunal notice is given.
- 25. Q. Do you think it will be n good thing to abolish the application system ?—I do not think eo.
- 26. Q. You irrigate 50 acres, and you can go on irrigating that until you wish to relinquish?—Different crops are gm wn hy rotation, and, therefore, the application system is accossary.
- 27. Q. Does the change take place frequently?-Yes, every year. The rayats change from kharif to rabi; the rates are different for different arops.
- 28. Q. Would the average area of coch description of crops be the same for any, ten years or so?—The areas are always changing; an owner may let his land to a cultivator, who would sow according to his own ideas.
- 20. Q. Are there facilities for sinking wells in your district?—You cannot be certain of getting weter.
- SO. Q. Supposing you could got water, would you irrigate ougar-cano?—Many people have attempted watering sugar-cano from the caualo, but have failed, os the wateroupply is insufficient.
- S1. Q That is why I suggest that wells should be sunk to supplement the canal supply?—Even then, they would not be sure of getting the supply necessary for watering angarcane.
- 32. Q. Would it not pay to a certain extent to eink a well to supplement irrigation?—I don't think it is likely that water will be found.

## THIRTIETH DAY.

## Belgaum-10th January 1902.

## WITNESS No. 78.-Mr. R. C. Brown, I. C. S., Collector of Belganm.

Mr. R. C. Brown. 10 Jan. 02.

- 1. Q. (The President.)—You are Collectar of Belganm?
- 2. Q. How long have you held that office ?—Six months. 3. Q. Where were you before that ?—I have been in Sholapn, Ahmednegar, Poena, Satara and Kanara.
- 4. Q. I see that you give in your memarandum at page 315 of Mr. Beale's report, the number of talnkas, which are liable to famine?—Yes. I think Athni is the worst.
- 5. Q. Ic there no hope of anything helng done there?

  No, there appears to be no hope.
- 8. Q. You refer to the Yndvad, Bheiranbati. Do they come nader Mr. Fitz Gibhon's scheme?—I think they would. (Mr. Beale explained that both these schemes here been rejected on account of bad foundations.)
- 7. Q. You say the portion of "the country lying round about Yergatti is the worst off ns regards water-supply and the Imperial irrigation tank wark of Yargauvi (entered in the famine programme) would be extremly useful in this tract. Do you think that the cultivators would take irrgation for their dry crops and get into the habit of taking it year after year?—Yes, I think they would, if the Gokak Canni is extended.
- 8. Q. Yon think that the extension of the Gokak Canal is a promising project?—Yes even if no storage is made, the kharif area would be extended.

- 9. Q. I understand that n part of the canal hoe been actually dng?—I have not eron it. I believe it goes neross the nallah. (Mr. Beala explained that n good deal of the earthwork had been done during the famine.)
- 10. Q. Do you think that there is a large field for the extension of well irrigation?—There is a large field for the improvement of the existing wells, as very many new ones have been constructed in the last five or ten years, particularly in Athni and Gokak.
- 11. Q. Have you given out large ndvances?—Yes, very large, especially lately. This is the fifth ouccessive year of femine in Athni.
- 12. Q. What has been the effect of drought on the wells in this taluka?—The people complain that there is very little water in the wells.
- 13. Q. Have they tried deepening? -Yes, but that was just year.
- 14. Q. In Sholapur, I believe it is being done?—I do not thick that it would be successful here.
- 15. Q. I see that a large our seems to have been spent on despening?—A good deal is ontered that has not been spent.
- 16. Q. I see from Mr. Lawronees's figures that in 1899-1900. Rs. 1,01,311 were given away in takari. How much of that was spent on wells ?—In 1900, out of Rs. 1,58,000 Rs. 37,000 were given for wells.

- 17. Q. In 1899 the whole of the Rs. 1,01,211 was for wells alone?—Yes, the decrease last year was largely dus to the indebtedness of the rayats, who had taken takavi largely in the previous year, and also borrowed from
- 18. Q. Do you think they would take it from Government, rather than go to the some ar?—They take taken in preference to going to the somear.
- 19. Q. How long will it take a man to get a takevi lean? This year, it has been done very midly. The District Deputy Collectors went to the villages themselves.
- 20. Q. Did it take about a month?-As soon as the officer audid got to the village, he made an enquiry, and gave the money at once. It depended on how seen he could get to the village. It may have taken a fertnight or three weeks.
- 21. Q. Was a large proportion of this takavi spont on subsistence?—Yes, a good doal of it was used for the purchase of food, etc.
  - 22. Q. Was there any check on that ?-No, not at all.
- 23. Q. (Mr. Muir-Mackenzie.)—Are not the works inspected P-Yes; I visited many of the places myself, and tound that the money was used in most cases freely on tanks, improvement of wells, etc.
- 24. Q. (The President.)—Did you give takavi for repairs of small tanks, otc.?—Yes, for tale.
- 25. Q. Are they in general use in the whole district?—Yes, in Athui, Chikodi, Parasgad, etc.
- 26. Q. Would it be a good thing to give them professional help in laying out tals ! Yes, I think it would be a good thing. They apply for takavi for tale and are very keen on such works.
- 27. Q. We lind eridence yesterday that the works are so scattered that they would not be of any use as rolled works?

  I think it might be done by putting a surveyor in charge of the works.
- 23. Q. Looking to the future, do you know of any better protective work for famine labour?—For a future protection the best thing in these talukas would be the improvement of wells. In regard to athul, if a tank could be built, it would be an excellent thing. It would provide for a certain amount of labour in bad years, and give a small orop.
- 29. Q. (Mr. Higham.)-liave you anything to say about amali villago tanks, or second olass irrigation works P—I have no personal experience. I have not travelled in parts of the District where they are situated.
- 30. Q. Did you hear what Mr. Fitz-Gibbons sald yestor-30. Q. Did you hear what air. Fitz-Gibbons said yestordny. I understood that in many eases, when the tanks da not fill as high as they used to, the land is re sold to the villagers, and that now that it is proposed to repair these tanks and make them hold water, it will be noccessary to acquire that land again. Would it not be pessible to make some arrangement much loss costly than acquiring the land; could we not let the people keep the land, and cultivate it when the water goes down?—Yes; it is necessary to acquire it.
- 31. Q. Do you think they would be satisfied if you relieve them of the assessment and charge only when they nctually cultivate?-Yos.
- 32. Q. (Mr. Ibbetson).-Of the wells made during the last five years in the insecure tracte, are near kachcha ?— There are a tromendous number of kachcha wells. In Athai there nro 42,000 kachcha, against 530 pakka.
  - 33. Q. Thoy are almost all kachoka?-Yes.
- 34. Q. Evon, samposing the people were ready to take taken to make them pakka, the value of the land in most cases would not cover the loan?—The value of the land as now encumbered would not allow sufficient taken.
- 85. Q. Do you think it would be worth Government's while to run a contain amount of risk in making advances, in view of the fact that the value of the land would thus be enhanced P—Yes, the making of advances would increase the value of the land.
- 36. Q. I suppose water would be found?—That is the great difficulty; there is no water in the pakke wolls.
- 37. Q. When did the water begin to fail ?- In the fourth year of drought.
- 38, Q. Then you doubt the advisability meat's running any risk in that way?—I think Government might risk further advances, if there is a fair chance of gotting water by some such plan as that suggested by Mr. FitzGibbon.

- 39. Q. Your only doubt is the precariousness of the Mr. R. C. mater-level ?-Yes.
- 40. Q. You have adopted, in famine times, a procedure which has enabled you to give out takavi much more rapidly than in ordinary times. Was the saving of time dae to the summary procedure regarding the enquiry P—Tao saving in time was not due to the inquiry being less careful, but it was more expeditions, because the Suh-Divisional Officer left his other work and make personal organics. on the spet.
- 41. Q. Could they not do that in ordinary years ?-They could not afford the time to do it.
- 42. Q. There is a tract in the south-east, where wells would he impossible ?—Yes, Parasgad.
- 43. Q. Elsewhere could wells be made saccossfully?—Yes, I think that wells might be distributed all over Athni and Gokak in the insecure tract.
- 44. Q. You say in your note, which Mr. Beale quotes, that in 1890-01, the whole of the insecore tract suffered from famine. Was that a real famine, like that of 1876-77?—I believe it was not I can only say from what I have heard from other officors.
- 45. Q. (Mr. Rejaratna Malr.)—You say that the Gokak Canal could be carried across a certain nallah. Could that extension be carried out at once, without waiting for the 91 lakhs scheme?—Yes, it could be done at once without storage.
- 46. Q. Could a large area be irrigated from it?-I do not know. It goes through a very rich tract, which is not irrigated.
- Mr. Beale explained that it depended on how far the oanal was carried. Even if it was earried five or six miles, a considerable area would be irrigated.
- 47. Q. What would it cost to carry it over the nallah. Is it a very broad stream ?—I do not know.
- Mr. Beale explained that the estimated rate was Rs. 80,000 a mile for the full-size canal.
- 48. Q. A great deal might be done by the improvement of existing wells?—Yes,
- 49. Q. Are there many wells which could be improved? Yes, a large number.
- 60. Q. Are they now in use ?-Yes, many of these wells are now working.
- 51. Q. Is there any difficulty in getting taken leans for this work?—The difficulty in getting advances taken is due to the fact that people have already taken so much money.
- 52. Q I find from Mr. Lawrenco's table that in the first ten yoars about 15 lakhs wore advanced under the Loaus Act. Would it act be useful to make a systematic inquiry as to how the money was spent P—It is no use unking inquiries as to past work. It would be a good thing to do so in
- 53. Q Advances are given in a lump; would it not be better to give them in iastalments, after inspection of the works; to see that the first instalment has been properly spent before giving a second advance?—I think it would be a very good thing; and would ensure a check on work done in futuro.
- 54. Q. On page 320 of his report, Mr. Beale says that the sapply to the Goksk Mills will shortly rise to the fall limit of 186 cubic feet per second. Is Government bound to raise the supply to that limit?—I do not know what the
- 55. Q. In the commanded area of the Gokak Canal, nro there facilities for sinking wells?—Yes, I should think so.
- 56. Q. A cultivator said yesterday that there were no facilities?—The water-level rises where there is a canal.
- 57. Q. Would it not be a good thing to affer special facilities to induce the rayats to sink wells P-Yes.
- 58. Q. That would lead to the extension of perennial ops?—Yes, sugarcanc is not grown owing to the uncertainty of the water-supply.
- 59. Q. I notice that a great many wells have been made in the Gokak Canal area?—One hundred and six new wells were sank in the Gokak taluka. Two hundred and nineteen pakka wells have been built in this taluka during the past fire years.
- 00. Q. (Mr. Muir-Mackenzie).—I understood you to say that your inspection showed that takavi money had been tolerably well speat on works. How do you infer then that much of the money was misapplied?—Lango

Brown.

- Mr. R. C.

  Brown.

  the most half, has been spent on the works, for which they were berrowed. But 1 have also seen works on which Rs. 1,000 have been spent, of which only Rs. 500 were advanced by Government.
  - 61. Q. Are you confident that the remainder of the advance did not go towards giving subsistence to the persons compleyed on the work during its construction P.—I do not think that much outside labour was called in.
  - 62. Q. So that the amount might represent the men's own labour ?-Yes.
  - 69. Q. Could not may misappropriation have been granded against by rigorous inspection?—The establishment was not safficient to place any check on the expenditure aluring the famine years.
  - 61. Q. In ordinary times, could not inspection be carried out? Yes, in ordinary years it might be done.
  - 65. Q. Admilting for argument that, in a fouring year, there is arisappropriation (about this Government has expressed considerable sloulet) in ordinary times could this misappropriation be prevented?—Misappropriation will not take place to may great extent in ordinary years.
  - [(Mr. Ibletson).—The whole question has recently been discussed by the Government of India and that Government has come to the canclusion, that, in ordinary years, the misappropriation is so small, that inspection was not worth keeping up.
  - (Mr. Muir-Mackenzie.)-The Bombay Government has a'so considered the subject and has come to the conclusion that the amount of mi-appropriation was very small.]
  - 66. Q Do you think that famine labour, if employed on fals, could be accessfully organised and supervised?
  - 67. Q. Would you do it by Public Works Department or Civil Agency ?- I would like the engineers to ndvife.
  - 63. Q As you cannot sink wells in Parasgrd, what form of protection would you advocate? Do you think that tale would be suitable?—I have not examined the anbicct.
  - OR. Q. Are there hills where tale might be made for No; the country I have seen is flat.
  - 20. Q. Are there other parts near the hills, where the lands are uncrea and where tale could be unde?—I do not

- 71. Q. As regards Mr. Higham's suggestion of leaving and which might be anbaceged by the tanks in the ownership of the cultivators would it not be necessary to compensate him in years when he could not cuttivate it?
- Mr. Higham,-My idea is that the assessment might be air. Mignam.—My idea is that the assessment might be abolished altogether, the cultivator rotaining the land. It would apply only to doubtful lands which are countines submerged and sometimes are not. Let the land be held free of revenue ou condition that we can submerge it when we like.
- The President.—They would not pay the land tax, even in the years in which they use the land?
  - Mr. Higham .- That is my idea.
- 73. Q. You say that the land is so encumbered that you cannot give more taken advances. Does that apply to the whole district P—No; only to Athui and in Gokak where very little more could be advanced on land sceurity.
- 73. Q. How much has been advanced f-In Athni Rs. 48,000 were advanced in 1891 for wells and other land improvements.
- '74 Q. The assessment of Athal is Rs. 1,48,000. Do you think that you have adrenced three your transmest.
- 75. Q. The land is worth twenty years' revenue?—I think so much has been advanced that the ordinary Sub-Divisional Officer would decline to take any risk, unless he has speoud powers.
- 76. Q. Is there any part of the famine tract of this district, in which you would advocate the extention of small tanks f-None.
- 77. Q. How do you account for the large area under wells in Sholapur (192,000 area) and Ahmedaagar (10,100 area) compared with Helganum (30,000 area)?—These two districts are practically of the same nature as Gokak and Athai in this district.
- 76. Q. But Rijapur le slill more so and yet there is very little well irrigation !—I think l'ijapur is flatter; in Sholapur there are many ups and downs and nallahs.
- (Mr. Muir-Mackenzie).—That would hardly account for the difference,

Wirness No. 70.—Rao Sanen Nabayan Ganran Nabole, Mamlatdar of Athni Inlaka.

Anerers to printed questions.

The information refers to Athni Toluba afone, which is a baily affected portion of the District.

Mr. N. G. Nadgir. 10 Jan. 02.

- 1. Culturable area, etc.—The gross area of Athal Talala, which lies on the northern frontier of the Balgatian Instrict, is 522,118 area, of which the culturable position amounts to 460,568 areas. 8,022 areas of land only of this area are protected by Irigation from private wells chiefly, an insignificant portion of 30 areas being irrigated by channels or pats from unliabs. The proportion of rultivated area to the area thus protected is therefore 58 to 1 in the actual times. This proportion is still reduced to 69th purt in a year of drought like the past year. The talaks is devoid of any Gorenment trigation works, probably on account of searly rainfall which is required to keep the tanks with a good supply of water, and of the difficulty of utillising the nater of the Krishna River, which flows from west to east throughout the southern portion of the talaka. An attempt was made during the famine of 1806 to construct a large tank by bunding up the Agnai Nallah near the villings of Tanushi by famine latour; but the project was abandoned as augmences ful after incurring an ouermous expenditure by Gorenment.
- 2. The soil of the taluka consists of soft black and "Larl" black meant or reddish light soil chiefty. The soft black roll is suited for almost all sorts of crops, dry as well as girden, requiring comparatively small amount
- of rainfall to give moisture, and when it is once completely wet for about two feet deep, it does not require repeated rainfall since it possesses the power of retaining mosture to produce erops; while the "karl" black soil, which is mixed up with particles of limestone or sand, is very hard to communicate moisture. It requires, therefore, more and repeated rainfall and is considered to be of inferior quality, though it almost equals with soft black in all respects when the rainfall is favourable and sufficient. The measure or light soil is chiefly used for kharif or early crops, requiring almost an equal quantity or rain with the "karl" black. It is not suited for the growth of what and gram and other late crops. All kinds of soil are suited for producing garden crops by artificial irrigation, and a quire couparatively small amount of rain for the dry crops they grow. Even about 15 inches of the full, distributed in the proper seasons throughout the year, is quite sufficient for the production of an average crop, and the failure of this benefit brings about distress.

  3. As has been stated above, the area irrigated by wells
- 3. As has been stated above, the area irrigated by wells in the taluka is 8,622 acres out of 466,669 acres of culturable land. It ensists of small patches of garden lands in some villages only where water can be reached at a small depth in the wells to allow of the drawing of water by the working of the not. Many villages are void of

gardens owing to the hopelessness of finding water underground. The following table will show the rainfall at the each month:—

The above will show that the fall has been very scarty and indifferent during a great portion of the period, notably in 1896, 1899, 1900 and 1901, with respect to the consonableness, resulting in the failure of crops and consequent distress among the people. A good quantity is necessary, especially in July and October at the latest, for kharif and rabi crops respectively, failing which, the crops suffer. In case late tains are at least favourable, much danger is not felt even if the early crops suffer since all available lands can be used for rabi crops. Northeast monsoon is generally favourable for the rabi crops, and it chiefly determines the situation of the senson.

- 4. The following kinds of crops are grawn in garden land by means of irrigation from wells, and the number of waterings they require are shown against each. They generally require water throughout the year excepting the rainy season, if it be favourable:—
  - 1. Sugarcane ... Twice a week for 11 months from March.
  - 2. Maizo ... Oaco a week for 3 months from May and Septembor.
  - 3. Sweet potatoos ... Once a week for 5 months from August.
  - 4. Wheat ... Onco n week for 3 months from October.
  - 5. Betel leaves ... Once a week all the year round.
    6. Juni hundi ... Once a week for 8 wouths from
  - April.
    7. Plantain ... Twice a week all the year round.
  - 8. Turmerio ... Once a week for 11 months from
  - 9. Juari Kadawal Once a week for 3 months from fodder for cattle. April.
  - 10. Chillies ... Once a week for 9 months from June.
- 11. Vegatables . ... Once a week for 3 mouths.

No irrigation revenue is realized in this taloka, there being no Government irrigational works of any kind.

5. Black cottan soil.—Black soil lands are generally very fertile, possessing moisture-retentive power and therefore not requiring repetition of showers. If they are once thoroughly hocistened before sowing moch rain is not afterwards necessary, and a shower or two during flowering period ensures a good outturn. This soil is useful both for dry and garden crops, and is well adapted for all kinds of into crops, especially wheat, ection and gram, which do not flourish so well in other kinds of soil. Small tanks constructed in such soil can hold water without any danger of absorption or leakage. "Karl" kind of black soil is consplouens for waterholding quality without any such danger, and high earthou dams made of it can safely be relied on, though soft black soil embankments may require stone-pitching inside. Masonry core wells may soldom be needed as the

rainfall in this that is very seanty. Well consolidated dams can be safely put up. But the question is as to the source of water-sopply of such tanks. There are no tanks for irrigation in this tahuka-probably not constructed owing to the difficulty of securing sofficient rainfall to utilise them. In fact they would be unfruitful job in the plain tract, if undertaken, except in some places by impounding nallahs on the slopes of hills. The black soil land does not, if soft, require irrigation for garden crops during monsoon, only if there is good rainfall; but it does require it in the remaining period of the year. No falling off is the irrigated area of such soil is observed in years of good minfall owing to sheek demand. People have certailly a desire for irrigation works on this soil, but they appear to be almost impracticable owing to want of sufficient rainfall to make them useful. If they would be successful they would indeed be very remunerative like the wells.

G. Wells.—The total area irrigated by wells in this taluka is, as stated in paragraph 1 supra, 8,022 acres in ordinary years and 6,735 acres in years of drought. The following table indicates the number of new wells, as also old ones deepened or otherwise repaired during the course of the last ten years. It represents also the extent to which their construction and repairs have been assisted by tagai advances:—

Year.	Total new wells con- structed.	New wells from tag ai adrances.	Repairs to old wells from advances.	Amount Ipaid for new wells out of advancer.	Advance for old wolls.	
1892	54 50 50 50 70 100 150 120 108	19 16 29 15 37 45 17 150 41 12	62 81 47 18 71 65 21 126 114 65	Rs.  3,815 4,000 2,520 2,430 10,300 6,128 2,300 32,011 5,913 2,800 71,717	Rs.  5,225 4 925 1,670 1,680 10,455 10,110 500 27,190 14,145 5,655 81,505	

7. The total existing wells used for brigation are reported to be 2,792, out of which about 1,130 only contained water more or less during the past year of famino, the rest having all dried up for scanty rainfall, though some of them have lately received a supply during the present rainy scason. No concession of any kind was

Mr N. G. Nadgır. 10 Jan. 02.

given to the constructors of wells, execpt that preference was given to them in the matter of giving tagai during the past years of famino. It is certainly desirable to stimulate the construction of new wells by more liberal paymonts of advances, and attempts are being made in thet direction co far as the security for edvances and the nature of the soil would permit, as will be seen from the figures given in the table nhove. Perhaps remission of interest on such advances, if not of a portion of the advance itself, would encourage the people to some extent to construct new wells with udvantage on u lerger scale. Numerous wells rand dry during the course of past years and most of them were despend with henefit. Some did fail, or were abdudopth of water in the wells below surface is eight feet, and the cost of kachaha wells need for irrigation varies from Rs. 150 to Rs. 500 according to the depth and nature of und the cost of kachcha wells need for irrigation varies from its. 150 to Rs. 500 according to the depth and nature of soil to be excavoted to reach sprioge of water, pakka wells of averoge dimensions cost up to Re. 2,000. Wells tree worked generally with one mot, though there are many with two or more, which work only when there is an incient water-apply in a good year. The area irrigated by a well with one mot is from 2 to 8 acres of garden lard. Some attempts have been made in the taluka by boring with a crowher in the hard rook, noder the native method, down to the water spring, and they have proved successibility in a gone cases and have therefore heen advantageous in the eeasone of drought. the eeasone of drought,

8. Relief Works .- Relief labour was omployed in this taluka, mainly on the road works, during the pest two years, end the total amount expended on them would he approximately Rs. 70,900 in round sum. The maximum number of workers on one day amounted to Rs. 11,160 during the month of July last. The works were as

Athni-Honavad Road, Athni-Kagrad Road, and Athni-Anentpur Road.

9. The Kagrad and Bijapur Provincial Road, which is in progress, is still left incomplete, and its completion is

- highly desirable since it connects two important commercial centres, namely, Atbni and Bijappar, to the railway station at Shedhal. Great difficulty is experienced for traffic in this taluka for wont of good made roads and communication is hompered thereby, which renders the carly completion of this road essential. It would tend to increase the facilities of communication, especially in the mossoco, during which time traffic is etopped to some extent owing to the old road getting muddy.
- extent owing to the old road getting muddy.

  10. I should here mention that a lerge relief work, nomely, construction of a tonk for irrigational purposes, was started near Tannshi by impounding the Agrani Nalloh during the famine year 1896; hat, as hos been etated above, it was abondoned after incorring an enormous expanditore. It would he a great hoon, as a protective measure, if some way be found out to get this work saccessfully completed so as to irrigate the lands it would command. This would alleviate the distress to some extent caused by the effects of famine which as of late heen unfortunately recurring in this taluka where the crops unfortunately recurring in this taluka, where the have soffered more or less sioce the familie of 1896.
- 11. There may also be found in the tainks a few enitable sites to construct tonks for irrigational purposes by bunding up nallahs on the slopes of small hills, though I amount present unable to say whether inoy would on successful and safficiently romunerative; but they would prove very neeful as protective works. It would be for the prefessional persons to decide and fix about these works.
- 12. Before concluding I would with great diffidence snggest, as a layman, an expensive, protective and oseful echeme for the consideration of the authorities. It is the construction of a canal passing west to east through the northern portion of the talaka, by directing the water of the Krishaa River hy means of a dam constructed at some point in the north-west corner of the teluka near Shedbal, I cannot of goorse are whether this maintains. leannot of coarse say whether this project is feasible, but if it be possible to execute it, it would offord an everlasting boon to the greatest portion of the taluka and protect people to a great extent from foilures of crops so-severely experienced doring the past famine years.
- 1. Q. (The President) .- You are Mamltadar of Athni?
- 2. Q. How long have you been there ?- Ahout 2; years.
- 3. Q. You have been there during times of drought and familae?-Yes.
- 4. Q. Sioce 1899, the famine has been very had ?—Yes. The famine wes rery had in 1899.
- 5. Q. You show that protection by irrigation is only 58 to 1 in ordinary times ?—Yes.
- 6. Q. That is almost entirely by wells?—Yes, only a small portion by channels and nallahs.
- 7. Q. In paragraph 6 of your printed memorandum four chow that the number of wells has increased during the last four years. There seems to be a large difference in the amounts advanced in 1899, Rs. 32,011; in 1900, Re. 5,913; in 1901, Rs. 2,300; why was there u sudden increase in 1809?—The increase in 1899 was due to the large advances of the last in the foreign of takavi in the famine.
- 8. Q. You show in the same table that in ten years, of 850 new wells 381 were made from tekevi; more then half therefore, were made by the people without assistance. Did they go to the sewcar for the mocey?—Some of them
- 9. Q. In 1899, 115 new wells were made from takari in the following year, ont of 120, only 41 were so made and in 1901, 12 ont of 106. Are these wells kachoha and in 1901, 12 ont of 106 or pakka?—Mostly kachcha.
- 10. Q. liow long well they last?—10 or 15 years where the soil is hard.
  - 11. Q. Are they huilt up on the mot side ?-Yes.
- 12. Q. Whot is the sub-soil. Do you require to go through rook ?-Yes.
- 13. Q. I sappose that just now a great number of wells are dry?—Last year the number wee very great; but the June and September rains brought a little water to some of
- 14. Q. Is the water level rising ?-Yes, it is hetter than it was last year.
- 16. Q. You say, " perhaps, the remission of interest on such advances, if not on a portion of the advance itself, would encourage the people to some extent to construct out

- wells with advantage." Do you think the interest high?
  —The interest at 5 per cent, is a little high.
- 16. Q. But the sewear charges more than 5 per cent.?— es; but if the interest were remltted, many more wells Yes; but if twould be made.
- 17. Q. You suggest that a portion of the adrance might be remitted ?—Yes, that would be a great boen.
- 18. Q. Do you think that people would he pleased, if, instead of giving the measy, on secessmeet was charged?—I doubt whether they would take the loau under these conditioes, as they would have to poy an annual wet assessment, which would last for over.
- 19. Q. Are the wells pretty nearly always used futhose that contain water ore all mod. The people their best to get water; but the supply is very seanty.
- 20. Q. What are the chief crops grown under wells ?-Maize, ewest potutoes and juari; also a little cane.
- 21. Q. What is the chief food of the district ?- They majotaio themselves chiefly upon juari.
- 22. Q, Do they irrigate fuari?—There is a special kind of fuari, which they irrigate, which is called hundi. It is only sown in gardens; and is watered.
- 23. Q. (Mr Muir-Mackenzie).—It is grown in the hot weather?—Yes.
- 24. Q. Is kadava juari growo under wells?—Yes.
  25. Q. For grain ?—Hundi for grain sud fodder; ond kadava for fodder only.
- 26. Q. (The President).—Is there anything that can be done for the Athoi taluka, to canble it to withstand famine?—I think that tanks might be tried.
- 27. Q. You suggest a canal passing west to each by directing the Krishna river "by means of a dam at northwest corner of the taluka, near Shedbal." Has thet been examined?—I do not know.
- Mr. Beale.—I examined it. But I think it is impossible from that point. If we strike out higher up, we might do it. It is a question of commond and of expenditure. There are two native States through which it would have to pass.
- 28. Q. I understand that there are not many tanks in Attail?—I could meetion four or five old ones that are silt-thurp, but they could be improved.

29. Q. Why are there not more tanks?—The country is very flat. And neer the hills water connot he obtained.

\$ 1,5

- 30. Q. Do the people often try bering?—They try; but I know only four or five instances, in which, after going forty feet, water hos been found.
- 31. Q. Do the people do the borings themselves?-
- 32. Q. In what proportion do they fail to find water ?-In 75 per ceut.
  - 33 Q. How much does such a horing cost ?-Rs. 50.
- 34. Q. How deep do they go ? About 40 feet.
- 35. Q. Not deeper P—Their appliances do not permit of it. They use an ordinary jumps.
  - 36. Q. Would it he a good thing to lend them boring tools?—We have already supplied one; but people could not moke use of them. The Public Works Department worked it. They tried it in the compound of the travellers' bungalow; and they succeeded in finding water after going 30 feet with great difficulty at a heavy cost.
  - 37. Q. You say that only eight thousand acree are irrigated by wells in the whole of this district, in which there is four lakes of culturable land. Do you think, therefore, that there is great room for the extension of wells? I think you might double the area.
  - 38. Q. Could you go on doubling it, till you make it ten times, provided you had manure?—It is difficult to find cites. The people would have gone on building wells, but for this, and also for the fact that many have built, hut failed to find water.
  - 39. Q. (Mr. Ibbetson).—You say that in some villages water can be got at a reasonable depth, and the people there have wells; but that in others the water is too deep, and, in consequence, three quarters of the people who sank wells failed to get water. In what proportion of the villages is water obtainable ?- In about half.
  - 40. Q. In villoges, where wells are possible, can they get water all over the villages f-No, they would have to select proper sites.
  - 41. Q. In those villages, where it is possible, would they he chie to sink wells in half the area f-No; there 210, small patches of from one to two acres.
  - 42. Q. Then wells are not possible in more than enequorter of the whole area ?—No.
  - 43. Q. Your takavi advances average Rs. 200 per well; are those kachcha wells?—Rupees 200 is coough for a kachcha well about 30 feet deep.
  - 44. Q. Would that well have mosonry on the met side? Yes.
  - 45. Q. How much will it cost to make that well pakka? -About Rs. 1,000.
  - 46. Q. Would it be made by dry mosonly?-They do not use dry masonry gonorally.
  - 47. Q. How much of the 30 feet that they have to dig would be rock?—About half, the other 15 feet would be surface soil and muram,
  - 49. Q. And the other 15 feet would cost Rs. 1,000 to make pakka ?-Yee.
  - 49. Q. Do you think that Government could safely odvanco money to make these wells pakks ?-Only if the owners have good security to offer.
  - 50. Q. Have they not got security to offer ?-No; lately the resources of the people have been taxed to a greet extent. And not more than 5 per cent. have any security to offer.
  - 51. Q. You tell us that a lorge number of the wells have dried up. What hoppened in 1899?—There was water till the end of 1900. In the first year they did not fail at all. The Soptember rains of 1899 were very heavy. The failure began in December 11 00; and lasted till June 1901.
  - 52. Q. What hoppened to the wells in Athai in 1896-97? They were dry; since then we have hed successive famines. -
  - 53. Q. (Mr. Muir-Mackenzie).—Con 'you tell us how much takavi has been advanced during the last two famine years P—In 1899-1900, one lakh thirty thousand; in 1900-01, seventy thousand, making a total of Rs. 2,00,000.
  - 54. Q. That does not represent one and a half year's revenue ?-No, about one year's.
  - 55. Q. When was the last Revision of Settlement?-In 1886.

- 56. Q. You have only advanced one year's revenue; Mr. N. G. what is the value of the land in the taluka; wes there not snough of scourity in land for further advances?—Ws advanced the money only to the poorer people, so as to give them employment. We did not give it to the richer pcople.
- 57. Q. But that did not increase the number of wells in the taluka, if you gave it to the poorest people?—We might advance more money to the richer people to make wells. The greater portion of the money paid was for other improvements of land.
- 58. Q. You could not advance much more money to the poorer people?-No, we could not safely advance much to thom.
- 59. Q. There are nine thousand holdings in the tuluka; ond the assessment is two lakes; therefore, the average assessment on each holding is Rs. 22: well, I suppose, you could very safely advance to a good many of those people twenty times the assessment?—We might advance twenty times the assessment to a selected number.
- 60. Q. Most of the ndvances have been given to holders who pay less than Rs. 22. Was not the land of these people already encumbered f—The encumbroness ore taken into
- 61. Q. But, if the Government has prior claim, why consider the encumbrance?—We only edvance mouey on unencumbered land, to be on the eafe side.
- 62. Q. Do you think that the greater part of the advances for wells and tale has been spont upon the objects for which the advances were obtained ?—Yee, most of the meney. I personally inspected most of the works.
- 63. Q. If a man get Rs. 200, how much do you think ha epont P—At least Rs. 150, but it must be taken into account that he did mest of the work himself.
- 64. Q. In Athni, what did the people toke takavi for, chiefly for wells or for tals !- Both, but tals consumed a larger amount.
- 65. Q. Is the country good for the building of tals?—Yes; need to the tokavi was given for tals. The people prefer wells; but they cannot afford to have them.
- 66. Q. About these four or five old tanks, which you mentioned, were they ever, in former times, used for irrigotion?—It is said that they used to be.
- 67. Q. In what part of the taluka, are they situated ?—In the north-eastern part.
  - 68 Q. Near the hills !- Near Taosi on the hill side.
- 69. Q. I suppose they could be used for retaining water in the wells ?—Yes, they are now turned into dry crop
- 70. Q. How many trials were mode with the bering machine, leut by the Collector in your district?—Only one; that made in the travellers' bangalow by Public Works Dopartment,
  - 71. Q. How deep did they go ?-About 30 feet.
- 72. Q. That is because nobody knew how to work it?—Yos; the Public Works Department tried; but they could not work it advantageously.
- 73. Q. From the statistical Atlas, I'find a great difference between the lands irrigated in Atlani and Chikedi. There is less irrigation in the former than in the latter P—Chikedi
- bordors on the glasts; and there are mallahs, channels and wells there. But, further east, there is a serious falling off.
  74. Q. You say that the people think the extension of tals better than the extension of wolls?—The people borrow for tals as well so wells; but the difficulty about wells is to find sites; and when sites hove been found, to find water. Therefore, I consider the making of embankmente better.
- 75. Q. Having regard to that difficulty, you think it botter to give advances for fals than for wolls ?- Yes; the people know the benefit, and some crop is usually to be had above these tale.
- for well were given in the famine year to the poorer people. In good years, when the water comes back to the wells, will they be able to get labour and manure to grow garden orops under them P—In Athni there is little or no manure used. 76. Q. (Mr. Ibbetson).-You say most of the advances
  - 77. Q. Do they grow maize without manure P-Yes.
- 78. Q. So that no difficulty will occur in growing first class crops when the water-supply comes back ?—No.
- 79. Q. (Mr. Muir-Mackenzie).—Thoy will use the mnauro from the cottle P—Yes; they will ase their own entile manure for engarooue, as only a very little will be re-

WITKESS No. 80.-Rad Bahadun V. S. Koppikan, District Deputy Collector, Belgaum.

Gokak Canal Irrigation.
The answers below refer to Gekak Talaka.

- 1. I have been in charge of the taluka as Sub-Divisional Officer for about nine months.
- 2. Statement of average monthly rainfull at Gokak is appended.
- 3. (1) The following obstacles to the extension of irri-gotion in the villegee commanded, by the Gokak Canal
- (2) There is no sufficient stock of cattle required for the sapply of mannre. The rayats are unable to keep large slock on account of want of means and fodder.
- (3) Vide answer to No. 2. The samply of manure is not enflicient.
- (4) All sorts of soils commanded by canni do suit irrigi-n. There is no obstsele on this point. tion.
- tion. There is no obstsele on this point.

  (5) Yos. According to the rates new in force, the irrigation for kharif and rabi crops is not commenced before 15th of June and 15th of October re-pectively. The supply of water is reduced after 15th of December. Consequently the irrigators of lands that are at a distance from the main canals do not get water regularly. If the reservoir fills in and the supply of water be available, the irrigation for the kharif crops should be commenced any time after 25th of May and for rabi crops from 1st of October and for summer crops from 1st of Febraay. The period now fixed for the filling of the applications for permission to take water is 15th Jane, 15th October and 15th February for the kharif, rabi and summer crops respectively. This limit should be relaxed in times of drought and extended to 15th of September and 15th of November in the case of kharif and rabi crops and 15th of November in the case of kharif and rabi oreps respectively
- (6) Yes. But this obstacle can be removed by advance of takavi leans.
- (7) Formerly the water rates were very low. They were radually enhanced from two to four times. The condi irrigation is not, therefore, availed of for the total frrigable area in the villages where caust passes.
- (8) Yes. Especially in the case of lands owned by non-agriculturists and Inamdars.
- (9) On neceount of droughte agriculturiets and agricul-tural labourers from affected parts have come to the canal villages and have taken to cultivation.
- 1. List of sueb persons is appended. The rayats of the villoges adjoining the canal villages cannestly desire the extension of canal to their lands. The Gokak Canal with its Shindi Nallah extension irrigates, at present, the lands of 15 villages. If the canal be taken to the north of the Kalleli Nallah the irrigotion may be made available at least for the kharif crops in many villages. If it be so extended, necessary return on the cest of extension will, it is hoped, be obtained from the water rates since the rayats of these villages are anxiously applying for its extension and on necessary returns on the cest of extension and on necessary cannot be successed. loges are anxiously applying for its extension and on ne-count of frequent droughts to which the villages are listle. The Public Works Department will be in a better position to ento why this irrigation is not so extended. This is in my opinion, e metter that necessitates serioue consideration and early action, if the extension he possible.
- and early action, it the extension he possible.

  4. Section 107 of the Land Revenue Code guarantees against the enhoncement of the assessment in case where improvement to lands ore effected by holders of such lands. Improvemente at heavy cost, both from private capital and with the assistance of takavi leans, are made in the talaka. Since then no revision is made. Tonants do not generally undertake costly works of irrigation unless they acquire some sort of permanent right over the lands from Isad-warers.
- 5. Lonns under the Land Improvement Act are freely token by the people for the extension of irrigation—
  (1) The rates of interest me sufficiently easy.
- (2) Remission of interest may be granted in case of wells and other inigation works which fail after the recipient has honestly executed the completion of the works nudertakon by hlm.
- (3) Partial remission may also be granted in the case mentioned in No 2. Rules to regulate the semo with necessary conditions seem, however, necessary.

- (4) Same as No. 4.
- (5) No extension of the period for repayment appears necessary.
- (6) Grants-in-aid may be given in exceptional cases where the takayi debtor failed in his work honestly under-taken and thereby exhausted his resources and no further grants under ordinary rules are possible.

#### B .- CANALS OF CONTINUOUS FLOW,

#### Answers to Section 7.

The cenal irrigation increases the value of the produce as

- (1) The two harvests possible within eight mentbs are:

  kharif, maize, onions, sadak, hersegram. The inejerity grow
  moize as second erop. I therefore take maize as a guide,
  By rains 1 arre, on an average, grows 4 "Hairs" (each.
  "hair" is of 160 seers of 80 tolas each) either kharif or
  sheleo juari with varielies of row crops along with it about
  1 "hair." The value of the produce in normal years is
  about Rs. 6 per "hair," thus making a total value of
  Rs. 30 and fodder worth about Rs. 2. By irrigation the
  first crop of maize yields about 6 "hairs," the second 3
  "hairs." The maize is valued at about \$\frac{2}{3}\text{the fodder worth}
  Rs. 4-8 per "bair"—, thus the total outturn is Rs. 40-8.
  The fodder when dried up becomes useless and brings almost
  novalue. It is, however, used when still groen. I take annas
  8 value of fodder. The total value of product is, therefore,
  Rs. 41. The difference is therefore Rs. 9 or 28 per cent.
  It should, however, be noted that the growing of the irrigation crop is much more costly requiring manure and onstant labour and the net increase msy be considered to be 10
  per cent. (1) The two harvests possible within eight mentbs are
- Note.—The canal irrigation is said to be too cold and in-ferior to that of well irrigation, and therefore the produce is also less. The produce of animaignted aero given above is of good land in a year of good ramfall.
- of good land in a year of good ramfall.

  (2) The crops that could be substituted are of longer duration, viz.—Paddy (five months), chillies, ground-nut, ewest-petatoes, and cotton (seven or eight months), engareane and plantain-trees (12 months). In the case of the last, sugarcane and plantain troes, the value of the preduce is much increased. Sugarcane yields about Rs. 200 gross value. Plantain-trees bring no income first year, but from the second to fifth year bring ubout Rs. 225 per acre, sixth and seventh year about Rs. 100, the avorage of seven years being about Rs. 160. But these crops are not generally grown on account of the uncertainty of irrigation throughout the year, and these that tried are said to have suffered loss. Betel-leaves and fruit trees are not tried. The remaining crops do not increase value or reduce the value, to speak of, if compared with the outturn of malze with two harcests. Kharif juari with varieties of row crops is grown by irrigation, and in that case the value of the produce is reduced to about Rs. 25 per acre compared with Rs. 41, the value of two maize harrests. But there is a proportionate reduction in the payment of water-rate.

  (3) The yield is not increased by irrigation:—
  - (3) The yield is not increased by irrigation :-
    - (a) in e year of ample rainfull, because the canal water is not generally utilized,
    - (b) in a year of scanty rainfall, the irrigators take water when necessary, and the increased produce, on an average worth annas 8 per acre is obtained,
  - (e) in a year of drought the crops are grown only by irrigation, the whole yield is an increase compared with erops in the neighbouring affected
- 7. Section 8.—The approximate estimate of the increase in the total annual value of the produce due to irrigation—
  - (1) Rupees 9 on the avorage of normal term of years.
  - (2) The prices of steple feed grains being doubled, Rs.
    108 in a year of drought. But the cost of watching against depredations by affected population and wild animals is much.

Section 9.—The approximate annual average rate per acre paid on account of irrigation is—

(1) By the cultivator, who chiains permission, on application to Government, as water-raic.

<sup>·</sup> Not printed.

- (a) Re. 1 for kharif juari, bajri, navani, ragi, sanvibarga, some rate even if the above are mixed with row crops of tur, kulthi, gram, etc.
- (b) Rs. 2. first erop of maize, first erop of cotton if mixed with kharif, juari in rows, onions.
- (a) Rs. 3, rabi maize, horse-gram, sadak, brinjal, vego-tables, second crop of onions, garlie, carret, rabi
- (d) Rs. 6, paddy, chillies, ground-nut, sweet-potataes.
- (c) Rs. 8, from 15th February to 15th June to the orops mentioned in clause (C). But none takes woter on necount of insufficient supply at this
- (f) Rs. 16 far the chillies sown for the purpose of transplantation from water taken between 15th of April and 15th of Jane.
- (g) Rs. 20, plantain trees, sugareone and betel-leaves.
  Fruit trees far which water is taken 12 months. Note.-No rate above Rs. 20 is levied.
- (2) The reut paid by the enlity to the owner of the land in the force of cubancement is 25 to 50 per cent. more than what it was before irrigation, say, on on average 15 to 2 times the assessment. The overage assessment is annas 4 to lie. I, and in few places its. I.4 and 1.8. The quality of the soil is mordi, karls, black soil, light black soil, masser (sandy mixed with red sail), sandy lond silted ap with deposit of black earth and another quality of soil generally called halmanh where plantain trees are grown. This soil is generally close by village site.
- (3) The owner does not pay any rate in excess of the assessment, unless he is a partner with the coltivator. The water-rate is essessed on the area actually irrigated subject to the minimum of one acre in the case of erops mentioned in section 9 (1) (a) and in case of rest 20 genthes. In the case of pat numbers or sub-divisions separately demoreated by the Irrigatian Department, the Minima abovementioned is not applieable. There is, however, no sub-division below 10 genthes.

Section 10.—The private expenditure to bring water to a field depends on the distance of the canal from which the branch is to bo taken. The cost is about 4 annas 100 running feet. If public path intervence, the cost of the con-struction of a drain has to be borne by the irrigator. The repairs to the canal cests balf of the original expenditure and they have to be made once in two years. The cultivator is allowed to do the work if he likes and in ease of his default the Irrigation officer executes it, the cost being recovered from the cultivator.

- I. To prepare the land for irrigation, the cost depends according to the level of the land ineven or otherwise cultivated er woste from Rs. 10 to Rs. 100 per acro.
- II. The cost of preparation of land for irrigation is generally barne by the owner of the lond and not by the towart. The further up-keep is looked after by the tenant, i.e., cal-

Section II.—Without manner no crops ore obtained by canal irrigation. Manuring by unking at least the slicep sleep in the land becomes necessary. No cultivater therefore sows seeds without manuring the land, if the crops are to be grown by ennal irrigation. If the sowings are made to be grown by enual irrigation. If the sowings are made by rain-water and enual irrigation is nonlied of to prevent withering of kharif juari, 4 annus crop is obtained. If erops are grown without manure, they do not ripeo and generolly fail, and the land becomes useless for the further growing of any crops that year.

- II. If irrigation be profuse the crops fail, unless enriched by further monoring.
- III. Extensive irrigation is not resorted to by a cultivator, the maximum area cultivated being 10 or 12 acres.
- IV. The cultivators take care to avoid damoging by frequent irrigation.
- V. Water logging destroys crops and makes the soil soltish.
- VI. Hero and thore salt offloresoence is created, and the area under salt efflarescenes is about  $\frac{1}{2}\pi th$  of the total irrigated area in the villages of Arbhavi and Balobol. In others it is nınclı less.
  - VII. The lend is not spoiled in any other way.

VIII. In the case of the land spoiled, as in VI, salt is eroated on the surface. The soil tastes brakish, and looks like khori land losing its tenacity. It does not even grow genes. It is generally low-lying ground, and the cause appears to be due to the constant meisture creeted by percolation and water logging from the edjoining high lands which obtain irrigation by canal. The sample of surface salt and the carth below are enclosed. No remedy, is as yet attempted. It is, however, thought that if fresh earth ba taixed up, the land might agoin grow crops.

IX. The irrigation is of about 18 years' stonding and the land commenced becoming saltish (vide No. VI) two years after the use of the canal water, and the area increases year by yeor.

X. The evil is gradually increasing.

XI. No experiment has yet been tried by draining irrigated fields.

#### C .- CANALS OF INTERMITTENT FLOW.

There are no existing canols of the sarte. Se no answers are necessary for questions Nos. 12 to 21.

22. I consider it advisable to encourage and assist construction by private persons and I mandars of canals of this sort. This is possible in several villages where there are nellabs which flow high water two or three times in the roiny season even in those of droughts and in villages where there is Isrga number of irrigoting wells, which have now failed, on account of failure of the flow of water in the nollahs adjaining them. I think canals of this sort are essentially recaired and will say helplost rays from are essentially required and will save helploss rayats from nsoless expenditure now incurred by them in sinking their wells deeper and deeper with little saccess. This can be done in few cases by advance of large taken loans to sabstantial land-holders, including Inamdars. Government can, however, construct such works in selected places, assessing the water rote ou the irrigators who will be benefitted by them.

#### D.-TANKS.

There are no irrigating tanks and no answers are therefare necessary for questians Nos. 23 to 31.

32. Vide answer to No. 22 above.

## E.-WELLS.

I have not travelled through all the parts. I have, however, seen the villages in the north, viz., Mudaigi, Mugalkhad, Hondigund, Nagnur, Palbhavi, Salianpur, Shivopur and Khanhatti. These villages have good many irrigating wells, the average depth is from 25 to 40 feet and naw nearly half of them have got dry; others have scanty supply. Many of these wells are dependent on the extent of the moisture retained in the adjoining nullahs in these villages. If the nalloh water be impaunded and tonks inado the supply in mojerity of these wells will instrumly in-crease and the villages will be able to get through famino years without much difficulty.

List of persons that have settled in canal villages to take advantage of irrigation coming from other villages.

- 1. Lokkya Mudakapa, former resident of Gokak, a cultivator, has come into Arbhavi and settled there as towart of irrigated lands and cultivates 8 ocres.

### WELLS.

81. (1) The only water-bearing tract in the taluke is the narrhern portion called Mudaigi Bhag of the taluka. The noture of the soil is mardi consisting of hard muram on the surface with soft stene-beds below, easily workable. The cost of digging is easy and of masanry construction, much reduced in consequence. This tract consists of (1) Nag-nur, (2) Mudalgi, (3) Hallor, (4) Mugalkhod, (5) Palbhavi, (6) Sultanpur, (7) Handigund, (8) Kopalgudi (9) Shivapur, (10) Khanhatti. The curface in these is undulating. The average depth of permanent wells in an ordinary year is 25 feet.

The rest of the taluka has been exploited during the last four or five years from takent leans. It eensists of :---

- (a) The rocky tract to the south-west and south-east,
  - (b) The eastern pertion of the taluka.

Kappikar. 10 Jan. 02.

Mr. V. S.

Mr. V. S.

The first is traversed by range of bills and consists of sandy sarface with hard sand-stones under it. It is very expensive ta work in this and then the water-sapply is nat plentiful. The second is an even stretch of black soil with granite beds under it. The depth of wells in the rocky tract is abaut 25 feet. In the black soil tract, irrigatian is only possible on the banks of large nallahs capable of holding water in their heds. Such nallahs are few and far between. On the banks of uallahs water can he had at the depth of 20 feet. The tracts further from the nallahs are nuworkable, even at n depth of from 50 to 60 feet. The only oxception to this is the village of Konjalgi which is similarly situated in this respect with the mardi tractin similarly situated in this respect with the mardi tract in the north. As this tract is most liable to drought, the only thing possible is by damming the unllahs and hoarding rain-water in large reservoirs.

- (2) In the water bearing tract the supply of water is both from springs and percolation. Easily as the water is tapped in ordinary years, the supply hegins to fall short and the owner has to dig deeper in a year of dronght. In this tract the water never gets saline nor in the rocky tract. It is only in the eastern tract where the water is saline, except what can be got near the nallahs.
- (3) The average cost of construction in a mardi or muram tract to the north is of a well of 24 × 24 × 24 feet 500 or 600 rupees with 3 yats (leather backets) over it. In the rocky tract the cost is Rs. 1,000.
- (4) A new well constructed will last for about 10 years without repairs; then it will have to undergo small repairs at intervals of five years.
- (5) It is raised by means of large buckets made of bide y bullocks on an inclined plane. There is no other device by bullocks on an inclined plane. resorted to.
- (6) The uverage area commanded by well for growing vegetable and maize is 4 sares; for growing valuable crop, such as plaintain, sugarcane, and betel-leaves, it is possible with one 'mot' (backet) to irrigate only one acre.
- (7) In a normal year almost the whole as mentianed in No. 6; in times of drongbt one-fourtb or less.
- 35. When this truet becomes irrigated the ont-put per nero is increased by one or two processes. It is possible to raise two crops of different kinds, and in the case of maize, the same kind. It also becomes possible to raise more valuable crops, such as plantain, sugarcane and betel-leaves, which is very rare. The ont-turn per acre of average soil of unirrigated orop in a year—

						Rs.
Of moderate rainfa	ll is	:		•		22

					_	_

(3) In a year of drought, while the out-put in an unirrigated soil is reduced to nought, the value of that in an irrigated area is doubled, though the extent of cultivation is reduced.

- 1. Q (The President.)—You are District Deputy Collector in charge of the Athni Division?—Yes.
  - 2. Q. How long have you been there?-For nine months.
- 3. Q. Where were you before that ?-I was Mumlatdar of the Dbarwar District; and after that, I was Chituaris to the Collector of Belganm.
  - 4. Q. You know the Gokak Canal tract very woll ?- Yes-
- 5. Q. You say: "I beg specially to invite your attention to the accessity of the extension of the canal to the villages on the north of the Kalloli nallah, for the parposes of irrigation, at least during the rains." Is that the nallah to which the canal has been made?—Yes.
- 6. Q. I naderstand that beyond the nallah the earth-work was made by famine labour f—Yes, daring the old famioe.
- 7. Q (Mr Muir-Mackenzie.)—Would the people take water in ordinary years?—Yes. They consent to take the water in ordinary years. In this delta, even now they take water in ordinary years from the first section of the Gokak

- 37. (1) The approximate minual rent per acre of an irrigated area for good land assessed at Rs. 1-8 is Re. 8 to 10 (double to treble the unirrigated rates). For middle class land assessed at annas 8 to rupee 1, it is Re 5 to 6.
- (2) Formerly in the original survey a higher rate was assessed in consideration of water advantage than now in the revision assessment. In the revision survey, however, the large cost of cultivation being considered, the advantage was lost eight of and the assessment is reduced. The rates are paid on the total area cammanded.
- 33. Not in the Madalgi eide (north). In the other tracts difficulties are encountered. Water-tollers are consulted by rayats in order to select the sito for a well.
- (2) Not in the Madalgi Circle. In the black soil and sandy soil tracts, sometimes foundation is not secared and the device resorted to in such cases, is to base the saperstractures on lags of Pahal-wood. If this is not the case, there is the hard granite or sand-stone, to deal with which the exca-

ration becomes very expensive.

None. The raysts themselves have laken to making borings by means of crowbars 30 to 35 feet in length with great encess in the mardi tract. Water sponts are had in such borings, saving thereby the expense of additional oxera-

39. I um respectfully of opinian that in the arid eastern tract the damming of nallahs passing through their field can be done by only rich capitalists who are very rare. Men of ordinary means will not hazard their capital. In alen of ordinary means will not hazard their capital. In cases where the nallabs are public property, complaints are likely to arise from the neighbouring occupants, and the cost is also heavy. Government alone can do the work and charge water rate on those who are henefitted.

As regards construction of wells by Government it is recammended that Government must set an example by excavation in the castern arid tract, one or two wells for trial. The points to be made clear are:—

(a) Whether sub-soil water can be bad by boring. If so, whether near enough to the surface to make it profitable to draw it by means of buckets for irrigation'

Tes. Tomporary wells and water lifts are constructed on the bank of nallahs and rivers, monly used.

Are temporary wells commonly used.

on the bank of nallahs and rivers, more especially in times of drought. They are a protection for eattle by growing folder and also to men by growing vegetable and cereals. Tagai is given for this purpose and is largely availed of in years of distress, that is sufficient, I

- 8. Q. Perhaps they would not take it in the richer land ?—I believe they would take it on ull lands.
- 9. Q. (The President.)—You say, the "following obstacles to the extension of irrigation in the Gokak Canal nrise—(1) there is not a sufficient supply of cattle which are required for the supply of maunre. The rayats are unable to keep large stocks on account of the want of means and fodder." Do they use artificial manner, fish or oil-cake f.—Only cow-dung and asbes.
- 10. Q. Why not, don't they know the value of it?— Perhaps, they do not use it because it costs a good deal.
- 11. Q. We found in other districts that artificial manure was used, and that the people bring up fish manure from the sea-side. Don't they do that here?—The people who da that must be large land owaers. Here there are only small land-owners.
- 12. Q. Yon say "nll sorts of soil, commanded by the canal, are suitable to irrigation." The canal does not go, then, through black cotton sail?—Yes, there is a small arm of black cotton soil, but it is not very deep and is sited to the irrigation of wheat, "

Mr. V. S. Koppikar.

10 Jan. 02,

- 13. Q. You say "if the reservoir fills, the supply of water available for kharif crops should be commenced any time after the 25th of Mny." Do you think that 15th June is too late?—The people commence sowing the kharif en May 25th, and the water should commence from then.
- 14. Q. You say that the rabi crop season commences on 15th October; and suggest that it should be commenced on the 1st. There is plonty of water in October. Why do they not commence irrigation on 1st October; why does the irrigation officer not grant them permission earlier?—I dea't know.
- 15 Q. De the people complain about having to apply for permission?—Yes.
- 16. Q. Would the abolition of applications be popular?
- 17. Q. Do you think it pessible to remove the applications? It would be better: a uniform rute could then be charged.
- 18. Q. What is the edvantage of the application systems when there is plonty of water f—The canal officer wants to knew who takes water and who does not.
- 19. Q. You say, "on account of drought, agriculturists and agricultural labourers have come to canal villages, and taken to cahivation" and you moutlon only five femilies in one village?—Five new families have settled in one of the 15 villages in the commanded area. [These were the names available at hand. My enquiry since I gave ovidence shows that nearty 100 (one handred) now familles have settled in the 15 villages. They are from the neighboaring villages of the Gokak and also of Chikodi Taluka. The population of the canal viltages has also considerably increased while that of the remainder of the taluka has mach decreased. Mny 1902.]
- 20. Q. Yoa say," section No. 107 of the Land Rovenue Code guarantees against the enhancement of assessment in the case where improvements to the land lave been carried out by the land-owner." Is this prevision of the law generally knewn?—I think the people generally knew this.
- 21. Q. You say that the "private expenditure to bring water to a field depends on the distance from the canal, to which the branch is taken, and is about 4 natures for a hundred running feet "?—Yes.
- 22. Q. How do they settle about taking the water-course across nucther man's field ?—It is generally taken through the boundary between the two lands.
- 23. Q. tion't the people between the canal and the field ever steal the water r-Yes, they steal it sometimes.
- 24. Q. You say "I consider it advisable to encourage and assist the construction by private persons and I manulars of causes of this cort." Has any application even been made by the peeple to build private causes? Four or five applications have been unde. Up to its. 1,000, I cm deal with the application. Above that it has to go to the Collector.
- 25. Q. How about the work F—They want to do it themselvos. The difficulty is that some nallahs do not cass through their own fields, and the difficulty of proprietors they arises.
- 26. Q. Are there many such cases?—No, only fow. I have been encouraging the people to construct such evalla and reservoirs to heard up rain water running down by nallahs.
- 27. Q. You seem to think that it is better than sinking wells !—Yes, but those canals do not run long after the mousoon !—The canals would run till the 15th February.
- 28. Q. How? By bunding up the nallahannd making it into a tank; otherwise the water runs away in half an hour.
- 29. Q. You say that you can hold water in these channels to 16th February; but in a well, would you not count on water all the year round?—Since the list famine, two-thirds of the wells fail, one-third or n little more are completely dry soon after 16th February.
- 30. Q. But in ordinary years, the causls would fail, and the wells would not ?— In ordinary years neither the casals nor the wells would fail.
- 31. Q. You say in paragraph 4 of your memorandam that "formerly the water-rate was low; but that it was gradually enhanced, until canal irrigation was much less availed of." Do you think that the rates are too high?—No; the water-rates are not too high to prevent irrigation.

- 32. Q. But so high that the peopls will not irrigate as freely as they might otherwise do?—The irrigators complain of the increased rates for kharif—juari. They were originally 4 onnas per acre; but are now Re. I per acre.
- 33. Q. Is Re. 1 generally the rate bore P—Yes, there is a great demand for water for kharif on the Gokak Canat, and the people think Re. 1 too high. For the kharif oren, I think it might be reduced. I think if the rates were lowered, there would be great carcase in the area irrigated.
- 34. Q. Do they not irrigate all that they can now ?-No, the whole of the inigable area is not irrigated.
- 35. Q. They do as much as they can P-Ycs; if the rate is redeced, they would be able to buy manurs to enrich the soil to grow better erope.
- 36. Q. What is n her?—It is a measure used here. It is the equivalent of 160 seers of grain.

(I Secr=80 tolas by measurs.

1 Seer= 75-76 tolas by weight end good quality 80 or 81.

#### 1 Scor=about 2 lb.)

- 37. Q. You say that, even if a man irrightes less than an ocre, he has to pay for a full acre?—There is a maximum fixed, and he is charged that rate, even if he irrightes less than an acre.
- Mr. Beale explained that this rule applied to low class orops.
- 38. Q. (Mr. Hiyham.)—Whot is n guntha?—33 feet × 33 feet, 30th of an asic.
- 39. Q. Do the people as manner for everything they irrigate ?-Yes.
  - 40. Q Even mosu-oon irrigation ?-Yes.
- 41. Q. What manures do they use ?-Cow-dung, ashes and sheep folding.
- 12. Q. What does it oost per acre?-Ropec 1 an aero on an average.
- 43. Q. Would they have to pay more per acre, for more valuable crops ?—Yes, for richer crops they have got to spead more. As much as 25 rupees are spent on monure for sugarcanc.
- 41. Q. (Mr. Rajaratna Mdlr.)—As rogards the period fixed for applications, do you think that the dates are fixed so as to prevent the necessity of double charges?—The date it fixed in order that the applications should be presented. Is is also used as a guide for the people to know that after that, water will not be given without double rates.
- 45. Q. Would you suggest that the applications be abolished?—I think abolition would be better; but extension of thee is certainly necessary.
- 46. Q. Yon say that the water-rate for juari is Re. 1 per nero. Is that for a single watering or for the whole crop ?—A single watering is taken.
- 47. Q. If the crop fails remission is granted. Is that guarantee not sufficient to encourage the rayats to irrigate ?—No, it does not cover their losses.
- 48. Q. What proportion of juari is dependent on rain and on canal?—In ordinary years, they do not grow juari by cauel water. Better crops are produced by rainfall; if the raynte see that the rain is going to fall, they go to the canal. They take canal water to supplement the rain sometimes, and in the Gokak Taluka, where rain is very seldom someonable, canal water is usually naked for.
- 49. Q. Anothero sufficient grounds for complaint regarding the water-rate?—The land assessment is 8 to 12 annas an acre, and the water-rate, proportionately, is too high; it should be 8 annes.
- 50. Q. If it was reduced, would there be n large extension of aren?—Yes, specially for kharif.
- 51. Q. How much ?-t think the area would be doubled, and there would be no fall in the revenue.
  - 52. Q. Consequently n larger area would be protected ?-
- 53. Q. Yon speak of the water-supply failing. For how many months does it full?—From 16th December to 15th June, when the supply is most valuable.
- 54. Q. Could not the rayats sink wells to supplement the caugh ?—Wells could be snuk; but, if the rayats do it, I think only half rates should be charged for irrigation by caual supplemented by well irrigation.
- 55. Q. Suppose if well water was used for trigation, and no rate was charged, would that be a good thing?

Afr. T. S. Koppikar. 10 Jnn. 02.

- Mr. Beale explained that water-rate was charged, if the well, tank, or Badki was within 200 yards of a Government water-course.
- 56. Q. You say that the rates are high for gorden erops. If they were made half, would that be high?—I don't think so. I think the people should he oncoaraged hy making the rate very low. When the Gokek Canal was first started no water-rate was charged at nil.
- 57. Q. Suppose exemption is gueranteed for five years, would the number of Budkis increase f-Yos, I think so.
- 58. Q. Suppose the system of implication is abolished, could the kulkarnis mensure up the men irrigated?—The present establishment is not sufficient for the Revenus anthorities to take over the measurements. Besides that the kulkarni is not trained as a sorveyor.
- 59. Q. The total irrigated aree of your district is only 6,000 mores for fifteen villages, would not the present staff be able to measure that?—An additional circle inspector on Rs. 25 would be required.
- [Mr. Muir-Mackenzie exploined that the villago accountants at present were not able to measure or servey; but thet they are being taught, and, after this is done, they might he so employed.]
- 60 Q. Could they not meesure by meens of a long pole. In the Central Provinces they do it ?—I do not think so.
- 61. Q. You say that upplications for the coastruction of bandharas have been received. What concessions are allowed in such cases ?—There will be no enhancement at the next revision of cettlement.

- 62. Q. Are they liable to be charged water-rate ?- Na.
- 63. Q. (Mr. Muir-Mackenzic.)—Have you inspected any takavi works?—Yes, mony.
- 64. Q. Do you think that the monoy has been foithfully spent?—No.
- 65. Q. How much has been spent an works, about half? -On an nverage, half.
- 66. Q. Where has the rest of the monoy gonc?—The odynness have been made in famine times for wells and tals—75 per ceat. for wells and the rest for tals, and a good deal has been epent on subsistence.
- 67. Q. In the case of welle P—About three-fourths was properly spent, and there are also eases in which people have spent mecory out of their own pockets.
- 68. Q. But as regords the rooting ap of weede and tels they only spent about half?—Even lees may have been spent in rooting up nath grass, we connot check the quontity.
- 69. Q. In accord to tals, there would not be that diffi-oolty P—No, we can meneure up the work. 70. Q. In the case of tals, they speat half the advance they received P—Yes.
- 71. Q Could you force them in spend the whole ?—I am donhtful whether we could make them spend the recominder now.
  - 72. Q. It is not difficult in ordinary years ?-No.
- 78. Q Does the 50 per cent. include the value of the labour of the rayat and his family ?-Yes.

WITNESS No. 81-Ma. J. E. WHITING, M.I.C.E., Chief Engineer, Public Works Department (refired).

Memo, by Witness.

Mr. J. E. Whiting. 10 Jan. 02.

In seeking to facilitate to the atmost the use of irriga In seeking to facilitate to the atmost the use of irriga-tion in order to alleviate funine in years of seanty rainfall (not of absolute drought), it will be necessary to consider systematically the varying of irrumstances of localities and to choose the system of irrigation that will there benefit the greater number of the inhabitants. In some districts two or more systems may be worked together; but generally it will be found that these would elash more or less, and thet it will be advisable to favour one system. it will be advisable to favour one system.

- 2. The systems may be classed under the following houds :-
  - 1st .- Irrigation by cannle from largo reservoirs.
  - 2nd.—Ditto by canols from large livers having perential flow.
  - 3rd.—From bandbaras on nallahs and streems with porcanial or cold weather flow.
  - 4th -- Irrigation by a series of controlled inondations? spreading over lungo tracts of nearly level lund as in parts of Kathiewar.
  - 5th.-From a series of weire or bandharas along torrents and eleep tribotary streams; channels from these to a screee of field tanks, or 'pockots,' heing out on one or both banks for the water brought down by every shower, that causes a run-off, or fresbet, from the catchment above cach weir.
  - 6th.-From wells.
- 6th.—From wells.

  3. Irrigation projects under the first two systems named above are manifestly the first that will be sought for and must be placed (like Railways) under professional Engineers both for construction and maintenance, but not necessarily for administration. At present it seems os if most of the professional skill available could be advantageously coupleyed in seeking for new sites and framing and executing economical and offective designs for storing and militizing (with a view to the special objects under consideration) weter that now rams to waste, and this not only for the large works coming under the first two heads, but also those under the lird and 4th, and, as will be shown further on, by initiating and guiding irrigation under beads 5 and 6. In fact it is chiefly under these last two heads that extensive improvement seems feasible. That is say to, whon all has been deno that can be dono mader systems 1, 2, 3 and 4, there will be left by for the larger area of this Presidency (excluding Sind) dependent on direct rainfall. If system No. 5 can be extensively inaugmented and No. 6 radically improved and extended, it is believed that a very large amount of what may be termed "ouxillary "rrigation of districts in years of ecanty rainfall can be effected by the

ngency of the people thomselvos, with due guidance and help at first from professional Engineers.

- 4. It will no doubt be noticed that there is no nevelty in soggesting irrigation from a series of woise or bandhuras along torrents and tributary streums, and thot if these were of much use, the people would have edopted them much more than they have done. Gronting all thus, it is the more important to explain why this is so and to suggest
  - 5. The reasons are probably .-
    - The reasons are probably.—

      1st.—Becenso generally these works have been tried for direct irrigation and have been found to supply water just when the people do not want and cannot utilize it, namely, during, or immediately after, each of the heavy showers that bring down the nallahe; that is to say, just when the fields are well scaked by the rain itself.

      2nd.—The narrow nallahs, snitable for these works, here after head to form good storage tender and

too steep beds to form good storogs tenks and the flow in them ceoses some after the rain itself

- 3rd.—The people would hesitate to co-operate to con-struct a good boud and channels large enough to lead the water available to a saties of tanks comlend the water available to a sailes of tanks com-manding their re-pective farms and so that they could be filled in succession and for use after-some days, because they fear that the water will not be fairly distributed. That the first tank of the sailes will be filled first, then if the flow continues, the second and so on. It will not setisfy them to arrange that at subsequent floods the distribution shall commence at the one proviously disappointed; for there mey be but one flood; or perhaps not sufficient floods and one flood; or perhaps not sufficient floeds and they may not come equally ecasonably. What is wanted is the cortainty that the owner of each tank below the channel shall receive his due proportion of each flood. It is believed that this con be guaranteed by a simple and notematic arrangement.
- 10. These works will need to be professionally designed and constructed with good, though not expensive, materials, put together by the people themselves. No patteries will be required and repairs will be simple and can be done by the raysts, who have paid for each work. Recorde of the lovels of the create and details of the arrangements should be recorded in an Engineer's office; so that any modifications that no found desirable, for that the villogers lower down ask for, can be considered by the proper enthorities. proper enthorities.

11. As to the field tanks, these will doubtless leak at first and may eventually silt up; but still the people will be well repaid if they obtain one or two good waterings after each replenishment. Tanks can be cleared out by famine labour and the silt will be ascful on the fields. Absorption is the bods of the tanks will either replenish the springs of wells, or pass into the nollah and so be of use at weirs lower down. Probably if this system be adopted generally, a great improvement in the supply to present wells may be anticipated and a larger number may be sunk. Also the dry weather flow in the main rivers will be sensibly augmented, so that the incidental effects of this system will extend to cystems 1, 2, and 3 situated further down; but possibly this system will olach with those others in years of scanty fall—along catchments, for instance, from which works on systems 1, 2, and 3 draw their supply and which are barely sufficient new, it is doubtful whether No. 5 chendl be onecouraged; especially as there is so much of this Presidency, that can nover be served by large irrigation works, there is ample, scope for system No. 5 without risking interference; but, on the other hand, there are some good sites for large reservoirs, which at present seem barred on account of the unmanagable size of their gathering grounds, the floods from which cannot be dealt with under present conditions, if these catchment areas cru all be furnished with bandhura works and moderating field tanks along the tributary nallalis, (tovornment may find it safe to sanotion construction of these important slorage reservoirs on the main rivers hereafter.

12. The general method of automatic distribution into field tanks that has been proposed for bandharas on nallahs may possibly he adopted for distribution from irrigotion tanals or rather from sids channels to each village below it, so that the canal authorities would need only to periodically discharge into those channels the succified amount of water required to irrigate all the lands, for which applications have been sanctioned there. This water would pass out into distributing tanks commanding those fields as in system No. 5 and be used by the people at their convenience. In this way the services of patheries could be dispensed with and all matters of dispute regarding rottion of supply, etc., to the properties noder each tank, could be sottled by panchayats. There would be some loss by absorption at those tanks, but less extravagance in the fields to better advantage for all parties. This might simplify canal administration and make irrigation popular and effective, and so justify expenditure on large irrigation morks, that would less on the number of people requiring help in times of scanty fall.

13. The system No. 5 has been described above with reference to eases in which it could be carried out by the people themselves, but it is applicable to lorger rivers that have a prolonged flow after storms and a continuous flow after the monsoon; rivers in fact thut would require museum; woirs and be worked noder class 3 but that their cold wenther discharge would not irrigate enough land to repay the cost of the works; if, however, numerous field tanks wore constructed below cannls from these woirs, their ntillty after every freshet would make them amply commentive; in this way system No. 5 may blond with and promote irrigation under system No. 3. The weirs, if provided with ample undersluicing arrangements, may have bridges over them and thus become doubly useful; for dotails see report on such works in Cutch State. Appendix

14. With reference to irrigation from wells it is believed that in districts now protected by canals the existing wells are allowed to go out of use, because of the greater cost of working them as compared with flow irrigation; and this even where the levels of water surface in these wells have her mised by percolation from the canals. In fact the garden lands that have been prepared for reli irrigation are often the first to utilize the canal and are encouraged to do so as an example to others by the administrators of the canals. This is all very well so long as there is a surplus of water available, but when fullure of rain course every drop would be valuable elsewhere, and then it is difficult to induce the rayats to resume well irrigation. It may be found desirable gradually to restrict, for garden land at all events, the grant of canal water to lands that cannot be irrigated from wells; so as to utilize not only original springs, but sub-roll water due to percolation from causals and tracks. The levels of water in mells bricey prejected canals have, it is believed, been recorded with a view to claiming for the canals whatever improvement may arise after admission of the supply; but the results are, of course, not conclusive in cases where the wells have been abandoned, as described above; for naturally, the surface in such would

new rise bigber than when they used to be drawn dry, or nearly dry, daily. If well irrigation can be encouraged, not only will more canal water be available for other land, but probably wnter-logging and the consequent tendency of springs to bring 'Rey' or 'Khar' efflerescenes to the surface may be reduced; for so long as drainage is downwards this does not appear; therefore by keeping a constant draft on springs to wells natural drainage will proceed. It seems therefore desirable to make the people understand that the canal authorities will never charge for sub-soil water even if proved to come from their works. This assarance, tegether with some restriction as to supply of canal water, where wells exist, or can be successfully snak, would probably save a lorge amount of sub-soil water from passing away into nellahs or exading through salt ladon strata to be experted on the soil; how longs the quantity must be, may be estimated from the percentage of loss by percolation in eacals of this Presidency.

15. In the present methods of drawing water from wells there is an unnecessary loss of efficiency through friction at the wooden axies of the wheels; this could be obviated by the use of irus axies on relief or ball bearings, or even on hease. If a few improved but simple appaintus were provided, or lent, for illustration by Executive Engineers on each large work, where the resumption, or increases of well irrigation is desirable, the people might adopt the idea. They might not take up a now pattern, but some simple and easily upplied improvement of their present mots, or Persian wheels would have some chance of adoption. Such improvements would have some chance of adoption. Such improvements would be especially appreciated when ease in Kathiawar and Gujarat lately. The cattle could be sent away to State grazing lands and a number of persons employed and fed in their place, with much better results than are possible with the present westeful machiaery. There are many wells that are not used, because their owners have become poor, or have lost their own hallecks, but oan him some for ploughing their fields. These could be irrigoted by good and light Persian wheels worked by hand power; which would be mest plentiful, when most required, namely, in famine yeers. These abandoned wells mud such us will doubtless be constructed, (when the supply to springs all over the country is anguanted through a general adoption of system No. 5) will not only increase irrigation, but supply preductive employment, conveniently contered, in time of disleases. It may be incidentally noted that, hereafter the neighbourhood of wells need not be unhealthy for relief eaups, if the simple methods proposed for destroying the larve of mosquitos, that breed in wells and tanks, be adopted; also, that when the amount of subsell water has been increased, the position of Springs should be sought and located by horings, so that the construction of new wells may be undertaken us productive relief work.

10. Works on systems No 3 can be constructed with advantage on good sites on rivers below morks on systems Nos. I and 5, although those sites may have been abandoued after systematic gauging of the perennial flow over them in former yours; because they can now utilize in addition the leakage mid waste water from the systems higher ap; while, on the other hand, the construction of these weirs lower down may given great value to sites for reservoirs that have been rejected, though otherwise suitable for relief work, by supplementing the apparently limited ecope of their stillty.

17. There are some sites available for execulout storage reservoirs, that are rejected, because their catchment basins are not of sufficient area to ensure full replenishment every year; and others that would require the run-oil due to two or even more average monsonus to full them; they are rejected, though this average run-oil might suffice, if they were once filled, for enumal local requirements and to make up annual losses due to exaporation and absorption. That is to say, when once filled they might be relied upon, even after a scanty monsoon, to retain an invaluable supply gathered in provious years for the enhanced requirements of a bad year—for instance, they would then serve to irrigate fodder crops and grazing lands for unemployed plough eattle. If these serious periodical domands be considered, it should in some cases outwistly objections that are put furward og first taking up land for reservoirs larger thm would suffire for ordinary local requirements. (For an instance see appendix No. 3)

18 As to the absorption of water on irrigation works it has been noted above that this nater should be utilized at wells and weirs lower down; and with regard to evaporation, which seems to cause a duly loss of about 1,000,000, cubic feet per aquare mile of reservoir surface, it may be noticed that, although not under control, yet it is not all wasted but

Mr. J. R. Whiting.

Mr. J. E. Whiting.

drank is as vapour by leaves of trees, or as dew by crops in the dry weather. Furthermore it cools the air and thos probably determines and increase rainfull.

19. It may be noted that although a year of actend drought all over a district seems to be unknown, and though the detention and utilization of the rain that does fall in ecanty years is what has been the basis of the foregoing suggestions, yet that in some districts the total fall in one yeor has been known to be so very small that great distress would have been felt in those districts even if all possible advantage of rain, nallohs and wells had been taken; these areas, too, may in futers years be even larger. These considerations should catweigh objections that exist to building as many and as large reservoirs as possible wherever beavy rain can be relied upon periodically to fill them, say once in 9 or 10 years; for such reserve tanks seem to be the only recourse against extensive periodical failures. A common objection against proposal to provide larger storage than would suffice to hold the minimum or at the outcide the average run-off (exclading failures) from any eathment mea, is that it would be unwise to encourage the rays to irrigate oreas larger than can be watered from the reservoir thus designed, every year; but, unfortunately, as things stand now, disappointment does occur in years of ocanty rainfall, and it is this that gives the opponents of irrigation as strong point, for it enables them to essert that irrigation doss least good just when and where most wanted; hat this drawback, due to disappointed confidence in the casale to supply their accustoned water, would cause if storage were provided for the water that now runs to waste la good years, and which should be detained not only to use with fodder orops and for the nausal requirements of famino years, but especially to support the credit of the average annual sanctions of water and thas obviate partial insporerlshment of those who strive to avail themselves of irrigation works to the utmost. It is not hero niged that any bear provided, but that those now generally granted may been provided, but that those now generally granted fairly be deh

plenty.

20. The ense of Maswad tank may be qooted to illnotrate the foregoing countle. The entendent area of this tank is so large that in ordinary years the reservoir is very soon filled and much water then runs over the waste weir, but in scarty years it fails to fill. So that the usual arrangements, which the cultivators may have made for wet farming, such as preparing fields, planting engancene cuttings, purchasing seed for garden crops and perhaps extra cattle, as well as mising leans for extended operations hased on the oredit of success in former years, all these brenk down when the tank does not fill; for then the Excentive Engineer has to refuse mony petitions for water, and this, too, in a year when their monson crops have failed! Thus the rayals who lare gene in for irrigation and had good prospects suffer more than others. Such coses, of course, tend to destroy confidence in irrigation projects, as regards protection in times of dronght, except where the tanks have unfailing ghat catchments; whereas, if the second tank that has been proposed were concracted with, say 140 equaro miles out of this enormous entchment, and to hold, say 3,000,000,000 cubic feet, and although it might take two or three years to accumulate this reserve (for wheaver Muswad tank did not quite fill, water would be let down from the new tank to make up the deficiency) yet it would rejusting the credit of that work with the people. The supplementing water would not he let down until all chauce of natural replenishment had cessed, so, that no available storage room might be wasted. The difficiency in Maswad might at the end of a bad monsoon appear greater, because the ran-off from those 140 square miles had been intorcepted, but the water would he available and it is manifestly waser to store it in the apper basin till the end of the monsoon, as explained above. But so soon as Maswad tank has heen assisted to its full supply level, a portion of the remnuing resure in the apper hasia could be devoted to allevinting diotress, who

able. It appears the a that with 'sufficient reserve eterage irrigation system in districts with ramfalls that are periodically good, can be trusted to alleviate distress: but that without it they tend to aggravate it.

eolly good, can be trusted to alleviate distress: but that without it they tend to nggravate it.

21. The case of Ekroek tank is one in which surplus storage has (though unintentionally) been provided: for along the Adeln river, only a small proportion of the available ran-off is asked for in ordinary years, while in had years, when the consumption is great the tank does not refill, but depends on the reserve oterage which then becomes of inestimable value, not only for crops and drinking water, but by the maintenance of wells which probably owe their efficiency to percelation from Ekroek tank and its canals. If, then, tanks can be provided in any district subject to occasional drangbt, they should be designed to bold of least double the water that woold be provided by present roles. In short, the provision of reserve storage appears to he the solution of the problom, as regards system No. 1, with reference to the present inquiry; for, as indicated in appendix No. 3, such ottra storage woold be coostructed by available relief laboor, and it is better to convert even good lands into reserve lakee with frieges of pasture, etc., that will preserve life in future dronghts, thus bliadly to devute these sites to remain as annestics for excess population that must migrate, or starve, when the periodic failares of rain recur. But there are many busins with inferior sails that could be dammed up and be utilized for reserve storage; and these basins are situated well inland, where the worst effects of droughts occur and where percelation into wells and any effect towards establishment of rain currents would be invalable. On the other hand, there are still a few sites for reservoirs in the Western Ghats mutilized. These would, of course, fill yearly and be very useful to the tracts they command; but being of masenry, they would be fur more expensive and would not supply so snitable labour for relief gaogs as the earthwork dams odvocated above in the centre of famine districts; nor would an increase of rain, if induced by

22. With reference to system No. 4, the chief points to be noted seem to bo: -

1et.—That although g reatly desired yet these inundations at present do often as much barm as good.

2nd.—That appareatly slight re-armagements of the conditions in each case can secure more general beachts; bat to effect this, systematic direction and co-operation of all parties is required.

While it is difficult to give general rules for these irrigation works, it may be noted that in each district the rayats know prelty well what is wnated, but a few interested parties obstruet operations, or will not pay their proper share of expenditure; vbcreas it they wore designed and laid out beforehand, these works would afford excellent labour for relief gange in time of drought and the cost need theu not bear nudnly on any one. It may probably be the simplest way, to quote an actoal case, where professional advice was called in to draw up such a scheme.

See appendix No. 4.

23. The rise of sndden floods in Gujarat and parts of Knthiawar with apparently less raiofall, than would cause a similar run-off in other districts, is due partly. to the omallaces of the general slope, but probably also to some conditions of absorption that are not clearly understood, and it seems likely that the sinking of wells, or otherwise providing inlets for water and caulets for air, might mitigate those floods and tend to retain for use in the sub-soils, much of the water that now passes away in floods; but it would be necessary, then to pass off by ohmnels the brackish water that would at first be found. At precent there is little or no circulation of this kind, and wells are not the assistance they might be in times of drought.

24. Next to water itself silt is the most important feature in irrigation projects, and constitutes the greatest dishculty in the way of their continued success. It goes without saying that the rate of annoal deposition of silt in a reservoir is the measure of its life and that therefore as little silt as possible should be allowed to settle yearly in a reservoir; and as the first annual fineds bring down the greatest quantity, it may be set down that every tank intended for irrigation porposes should have a catchment area so large, that these first floods may be safely allowed to pass out through underslaices; but this water should be held up by a, weir bolow the buad, and to such a depth that the silt may divide itself into clayer soil in suppension and sand and pebbles in motion along, or user the bottom and passing away through

openings thero, while the upper and cloyey water should be turned into canals filled to over-flowing and distributing the fertilizing matter on the fields, or into numerons field tanks, as described for system No. 5. It has been objected that if this system be adopted there may coensionally be a failure of the mensoon after those first silty floods have been thus dealt with; but if large reserve reservoirs be constructed with comparatively small catchinent areas on tributary branches, and if these be kept constantly full, the danger just referred to will be greatly reduced; for if the lower tank he not repleuished by the end of the rains, water can be let down from the reserve tank. That the upper tank will is time silt ap, must be conceded; but as its catchment may be small and its capacity so lurge, that it may take two or three seasous to fill it, the annual dopth of doposition will be small and therefore its duration as great, that it may be fairly expected some remody to this silting difficulty will be discovered before the reserve tank's ntility is seriously impaired. The construction of terraces for catching silt along the sides of the gathering area, for instance, or the erection of an alternative reserve on some other feeder, whose catchinent basin has been already terraced, may be considered.

25. The necessity for holding back water for use in scanly

25. The necessity for holding back water for use in scanly years and specially by the construction of innumeroble puddled trenches across the beds of nallahs in system No. 5 may seem opposed to accepted ideas about drainage, bat it is probable that in some parts of the country drainage has been carried to excess and that a failure of wells has resulted. If a foot or so of top soil be kept fairly dry, and if a better circulation of sub-soil water is kept up by an extended draft on wells, it is probable that the country will not be roudered unhealthy by a general holding up in every possible way, the woter that is now not only allowed to run to waste, but occouraged to do so. Modern researches seem to show that malaria does not come up out of wot ground, as formerly believed, and, if this be correct, a great difficulty in the way of increasing the amount of water available under ground, for use in years of scanty full, has been removed.

26. While it has been noted that at times of scarcity there will be lubour available (and that must be paid) for the construction of protective works, yet it cannot be doubted that, looking at it in only a money point of view, as much os possible should be done before such times come again, as have lately witnessed the destruction of many lakes af cattle, worth from 100 to 200 rapees a pair, as well as on enormous loss of reveaue, especially in the active states of this Presidency. Those have inaugurated unserous irrigation projects with great zeal, and these are still in progress in Baroda and elsewhere. The loss of revenue due to the past years of scarcity prevents the nettre prosecution of such works in some parts, but it appears unwise to learn the cost of droughts and then to wait for further losses before adopting every sort of irrigation that can be proved to be sound and feasible.

can be proved to be sound and feasible.

27. In canclusion any long rospite, that occurs may well be omployed to test on a practical scale such of the aumorons suggestions, as will have been put before the Indian Irrigation Commission from every direction and that may be deemed worthy of trial. Also, it may possibly be proved, one way or the other, whether wet cultivation and forests and large-surfaces of water do tead to produce an improved rain habit; but at all events, it should be seen before the next series of famine years is due, whether irrigation on an extended scale may be trusted to protect India from their ravages. So that, if not, the people may be warned in omple time not to multiply as heretofore in a fool's paradise, but assisted to emigrate to where periodical failures do not occar and where their labour will never be subject to payment at relief rates.

#### APPENDIX 2.

Suggestious regarding the utilisation of the flow in Rivers in Cutch during the monsoon, sent to the Cutch Durbar, 9th February 1:01.

If I am not mistaken, there is a great amount of fairly good, though saudy and light, seil in the territory of His Highness the Rao Sahib of Cuteh, which frequently lies fallow, or yields a meagre orop, because the full and seasonable rejus have not been received. Also it appears their there is seldem so much min, that a few extra waterings or even extra seakings (instead of mere sprinklings due to natural showers) would do danage, such as similar treetment has been found to cause in parts of Gajarat and the Decean where the average rainfall is more copious and where the sell is black and heavy.

2. If this be the case, the construction of comparatively small storage reservoirs or regulating basics, as they might

bo called, from which canals might water the fields, whenever there was a freshet in the river, would be of great use. The bund, or weir, being merely high enough to store safficient water to spread the supply over two or three days. If the peeple would make small tanks in good positions at a little dislance from the river, that could be filled, one after the other, from the main bund and its canal, they could let the water ont of these on to their crops subsequently and as required. Those bunds might be replenished at every fall and used to complete the waterings commeaced by the rain on their adjacent fields. In some places larger reservoirs with high dams could be constructed, that would yield a supply for the cold weather; but these would be for more expensive and difficult to construct and would generally be placed well ap in the hills; while the weirs and small hunds referred to above, might be built oil cloug banks of the river helow the site of the reservoir. The woirs would be useful in distributing by canals on each back not only the freshrts but also the natural rabi flow in the river and the supplies that would be let down from the upper reservoirs or regulating bosins. If these basius be constructed the observed.

8. Unless weirs in Cutch rivers are to be utilized for mensoon waterings, as well as for rabi orops, it does not appear that the untural flow in any of these rivots during the dry weather, will, when led out of the rivers by means of weirs with suitable head works and canals, poyn fair return on the outlay that would be incurred in building the woirs and forming the canals and looking after the irigation.

woirs and forming the canals and looking after the irrigation.

4. For instance, taking the ease of the broken weir on the Pur rivor, the longth of it is obout \$20 feet; its average height 25 feet and its mean thickness 6 feet, the mean eross scotion having an area of 400 square feet; taking the cost of the work at 25 rapees per 100 subic feet, the price would be 100 rapees per foot forward of the weir; or for \$20 feet, Rs. \$2,000. 'the canal and head works would oest probably Rs. 5,000, more; say at least Rs. \$7,000 this at 4 per cent. would cost Rs. 1,4.0 for interest per annum but this is only a first rough approximation to show that, the rabi flow alone won't pay the cost. Foundations and underslabing arrangements will be expensive and must be carefully estimated. The design of the prosent broken weir is very faulty in every feature and must be romoved, if this site be adopted for a new weir. (A sketch design and estimate is appended.\*)

estimate is appended.")

5. Now the water measured on the 29th January 1901 shows a supply of oix cubic feet per second; at least ind would be lost; leaving, say, four cubic feet; or only sufficient to water about 400 acres of dry crops. Now the rates for these would not be more than Rs. 1,200, leaving a deficit of Rs. 250 for interest alone, but there will be cost of maintenance; but if the canals were also to be utilized for monsoon water, it would show probably a very considerable net revenue, as the site commands o considerable strip of good land on the bright bank.

6. If a storage reservoir or even what may be termed moderating basus can be formed on this river higher up, this weir will prove still mero volumble; or on the other hand it may be found that the land can be commonded by a shorter and obcaper weir bigher up.

7. From inspection of the ground where the Pur river outs through the rocky ridges at the villages of Radhaupur and Traiyu, it seems probable some storage work can be economically formed, and escapes for the surplus water provided at the flanks of the ridges. The catchment area at this site is about 34 square miles. But before final oplaions can be given as to the best locations for the several structures that are possible on this river, complete surveys must be made as well as trial pits sunk to test the seundaces of the foundations and decide the depths to which they must be laid. The racks appear to be in rather thin layers with somewhat pormas materials between thrse. Se that great, deep and wide foundations laid in the best hydraulic lime must be specified, while the junctions of the wills with the banks must be effected with long wing walls united to the rock by concrete filling well reanned as. Cushions of water as they are called on which the floods passing over weirs may have their force broken, must be formed by building subsidiary walls at a little distance below the main ones. Otherwise the bed of the river will be oreded oud the safety of the works ondangered. Nothing but well-designed oud carefully-built weirs will stand on the Par. A drowing for the new weir and specifications will be sout shortly to show the sort of work that is necessary; but it is probable that a nerrower part of the river can be utilized which will

Mr. J. E. Thiting.

Mr. J. R. Whiting,

command more lend. The exact site may be decided when the surveys are ready.

10 Jan. 02.

#### APPENDIX 3.

Extract of a Report made at the request of the Darbar of the Palanpur State.

- 2. On the Knpm river two sites for large earthen dams were found, one below and the other above the village of Hathidra.
- Hathidra.

  3. Commencing with the lower site, this is situated \$\frac{2}{2}\theta of n unite up the gorgo, whence the Kupra issues from the Hathidra Vulley. It is where a low hill fnees the mountain on the opposite (right) bank of the liver, while the Huthidra read passes between it and the ridge that rises thence to the hills on the left hank. It will be seen from the section that the main gap, which has to be hunded, lies between thet low hill and the opposite mountain. It is to be 1,400 feet long, top width 20; the ground rises rapidly, on both sides from the river: front slope 3 to 1, back 2 to 1.
- 4. There is good stiff olay soil along the section, where trial pits have been small, sod there is an abundance of suitable meterials for construction of the dam in every direction. Good (brick) clay is procurable for the puddle trench and core. Water is plentiful even now on and below the surface of the river for use on the works, and for the people to drink, and there is ahundance of stone for face work on the adjecent hills, and there are said to be lime quarries in the valley.

  5. It is appropried to resent his hand to those feet user the
- be lime quarries in the valley.

  5. It is proposed to raise this band to three feet over the top of the hill, mentioned above, which is 77 feet above the river bed. This will enfice to impound a depth of 78 feet of water (a natural wasto weir, described below fixed this depth.) The gap at the read and another a little forther to the left will also he closed eventually, but will form very convecient ontlete for the water, if it should be necessary to stop the work during the monsoon. The regulating tower and outlet culvert will be placed on this read, or it may be found preferable to bore a tunnel through the low hill itself. In every way the site is a most convenient one for constructional ressons. It remains to describe the proposed lake and the conditions of its replenishment.

  6. Its orea, or water spread, when full, has been approx-
- proposed luke and the conditions of its roplenishment.

  t. Its orea, or water spread, when full, has been approximately estimated at four equore miles, at least. The valley is wide end flat, but the euclosing bills are steep and rocky. The slope of the river bed is 17 feet per mile. The mean depth 'of the reservoir is estimated at 22 feet and ils contents at two thousend five handred millione (2,500,000,000) cubic feet. The eatenment orea is only 15 square miles: so that this design would not be suited for the requirements of an ordinary irrigation work; hut it is very suitable for a protective work to be utilized chiefly in years of drought. The entelment area being so small compared with the contents of the leke, it will probebly take several years to fill it; but when filled, the unnuel replenishment would be lost over the weste woir if not utilized for irrigation. A quantity therefore equal to this may be drawn off for that purpose ununally leaving the rest for famine reserve.

  7. The rainfell at Hathidra has been estimated by the
- 9. \* \* \* \* \* \* \* \* \* \* It will be seen from the foregoing, that 690,000,000 enbic feet of water will be available for irrigation at the end of each ordinary monsoon. This quantity will enflice to irrigate 0,000 acres of ordinary cold weather crops, for which a revonce of Rs. 27,600 may be expected. But when this has been expended the numnal loss by evaporation has occurred in the lake without monsoon repleaishment (i.e., when the monsoon has failed) there will remain etill 1,500,000,000 enbic feet in the lake, which can be utilized for irrigating 15,000 acres of lend, the value of which in each u year cannot be estimated.

### APPENDIX 4.

Notes regarding Limbol rivers and lands 'ying at the north-east of Kathiawar.

- 1. The chief course of prespority and fertility in these districts consists in the annual silt bearing floods; supplemented by local raius; the latter is, of course, essential
- 1. Q. (The President.) You bove had many years' experiences in the Irrigation Department of the Presidency, and letterly you were Chiof Engineer? Yes.

- at euch high-lying parts as cannot be reached by the annual floods.
- 2 These floods appear to pass over most of the country with a depth of fram 2 to 3 feet. In the main nallahs the depth is greater at flood time, but generally only from 2 to 3 feet; these collabs are wide, shallow and very sandy.
- 3. The sub soil consists appurently everywhere of sund, probably sea and; on the a stratum of alluviel soil consisting of sand and cluy and vegetable, detritus hes been deposited through a long series of years. This layer of soil is in a state of unstable equilibrian. It is very ensity disselved and carried away; the floods bring it and if a higher more rapid current passes over any place the soil is wested away.
- 4. The soil consists in most pieces of equal parts of sand and elny; but in some places there are three parts of sand to two parts of elay; and in very peur fields the proportion is even three parts of sand to one of elny: The great object should he to retuin the eley and vegetuhle mould and to keep the sand covered up and and istanced.
- 5. The sand appears to contain salt; and this salt is forced upwards in many places by water from below upparently which brings the salt to the surface and renders the land burron; one of the objects held in view is the provent such upward percolation or to wesh away the selt if over it has been brought to the surface. It epicars that this can be managed.
  - 6. To sum up the chief objects lo be atteined are -
    - (a) To prevent land being cut up and washed away.
    - (b) To utilize and preserve silt (clay) as much us possible and to nucrease the proportion of it to that of sand.
    - (c) To cover up and get rid of us much sund us pessible.
  - (d) To prevent neward percolation of water and sait ellorescence from appearing on the fields.
  - (e) To wush this uway when it does come.
  - (f) To store as much water or possible in saitable tanks und use it for washing salt lend and for rice cultivation.
- eultivation.
  7. In order to earry out these, systematic treatment of the district is desirable so that when good is done to one part injury may not result to another part. Cero must be taken not to overdo improvements. By working all the arrangements systematically, double and troble bonefits will be derived; for instance, if the rapid passage of floods over certain fields be restrained by a number of low parallel banks and on as to held up the flood for a short time, the silt will be deposited on the fields and crosion prevented, but also the clear water should then he led into soitable tanks provided at convenient sites, so that these shall be filled with elear water instead of dirty flood water, which soon chekes up the tunk with eilt. The clear water will then be used to wash salt land.
- B. Again if cuts are made to draw off excessive floods from one district care must be taken that the water is not discharged on to lands already affected with floods. It has been noticed that in some cases this is done and that water coming from a flank, in addition to the former flow across the field, causes the soil to he cut up and destroyed. This uppears to he the causes of vartinjury at Jambu—a new cut is wanted to carry off water that flows from Siani towards Jambu and the extra water in the main river should be provented by a dam from entering the cut up land.
- O. If system be organized and an efficient establishment, works will easily be carried out so as to assist each other. Cultivation is allowed in the hede of large nallahs as at Punsina, but though it is a good thing to utilize sub-seil water for melons, the banks should not he allowed to be constructed across the river bed but parallel to the stream, then obstruction would not be caused in floods.
- . 10. When send is dugout of a cut or chunnel it should ull be deposited where n bank is required for a tank or other work and should be covered up with cley. It is thue got rid of and does good, instead of harm.
- 11. Details of the several channels and works proposed and methods of constructing tanks, waste weirs und outlete will be given hereafter when levels have been taken.

<sup>2.</sup> Q. You designed and carried out the Nira Canal. did you not !- I did.

- 3. Q. We should be glad to get the benefit of your experience. We are much obliged to you for the interesting momentum you have kindly sent in. In the first place you call attention to bandharas or field tanks. What size do you contemplate building these tanks?—According to the size of the fields; and I would build them in such a way that if the field-owners wished to enlarge them, they could do so. Several men might club together and make a tank for themselves. In the north-west corner of Sind, just above Karashi, there are a large number of tanks; people club together and gather into these tanks the water that comes down the nathab. There is a very large tract in Sind which is fertilized from such tanks.
- 4. Q. These tanks would irrigate four or five acres each?
  -Yes, I think so.
- 5. Q. They would not be called upon to hold water for more than a few weeks at a time?—They would give water as soon as the rain had done its work. They would store a supply for two or three weeks.
- 6. Q. Now you say that you would have a system of irrigation "from a series of weirs along torrouts and steep tributary streams." You would have the tanks filled from streams that flow one hundred miles away?-Yes.
- 7. Q. Then you say that " the narrow nollahs snitable for these works have too etc. I beds to form storage tanks. Would you not extend these landharas to rather larger streams?—Yes, they could be extended to the larger streams; but the great inspirity of them would be from the smaller streams, so that the villagers could manage them themselves. selves.
- S. Q. Would you propose that the bandharas should hold up to 3 or 4 feet of water?—I don't think any storage is possible in the natlah it-elf, as the velocity of the water it so greet that the bund will be carried away at once.
- 9. Q. Is the system carried out anywhore in the Deccant I have seen small tanks of this description in the Rooms District, near Porandhar, and in the hills near the Rim. The purpose is to catch the sit, of which they get a nice deposit from the hills. It is a kind of terracing. There is a great deal of it in Parandhar. In every nallah they do it, so catch the silt, brought down by the stream, which haven fortilising. le very fertilising.
- 10. Q. flave you ever tried your automatic system of distribution?—This automatic distribution was proposed by me in a dispute between a Native State and some villegers. It was found to work well.
- 11. Q. Generally speaking, is the silt in the Decean of a very fertilising nature f—Yes; in connection with the Poona unter supply. I suggested that silt beds should be made, so that in the dry weather, when the water got clear, the silt could be put aside and in the monsoon it could be utilized, instead of being carried away. It should be put buck in the monsoon in order to keep the water free from wells. In the Nira the uniter is dark with silt all the way down and there is very little trouble with weeds.
- 12. Q. We have been told by various witnesses as to the en Chats. We have here told by various winesses as to the possibility of storage tanks in the miny zone of the Western Ghats. We have learned of two sites above Lake Fife, and one above Bhatgark in the Nira Volley. Perhaps you can toll us of more?—On the Nira at Bhatgark, two reservoirs might be unde on the Gelavandi and Gaujawin. And there is another site above Bhore.
- 13. Q. Have they been inspected?—The one on the Gunjawin was very carefully surveyed. I had the plans ınade in detail.
- (Mr. Beale explained that these surveys and plans could not be found. He had found some; but they only referred to the survey of the right bank.]
- 11. Q. (Mr. Jibelson.)—I think that all irrigation projects should be printed. We have beard of many such cases as this, in which plans have been less after the expenditure of much time and money?—Mr. Berman did that survey. and the maps were most beautifully traced. He did both banks.
- 16. Q. To go further down, are there any sites for glat ricervoirs in Satara? - In Satara there are several sites non-the railway. These are east of the line. Messis. George and Maclaron surveyed them last year.
- 16. Q. Further north than that?—There was the Karla project on the Krishna; but I believe that has been reject-
- 17. Q. Are there any sites in Kolhapur?—I do not know. 18. Q. You probably know about the Alaladerl and Chankerpur tanke?—No; but there is a site at Raipur,

- which has a catchmont area of 800 square inites It is a good site, and there are two sites above it. I would store water in pockets outside the glasts keeping it, if necessary, for five or six years so as to have it available for a famine year.
- 19. Q. We find that a certain distinction has been drawn 19. Q. We find that a certain distinction has been drawn in the Decean between protective and productive works. The Motha is a productive work, and the Nirs, a protective work. Is there any advantage in the plug up this distinction f—I think that you might treat the supply up to a certain paint as productive, and beyond that as protective, to be utilised only in very dry years. If a work is expected to pay its interest on capital account, it should be worked to pay its interest on capital account, it should be worked to pay its interest on capital account, it should be worked to pay its interest on capital account, it should be worked to pay its interest on capital account, it should be worked. on my the numbers on explain account, it should no worked as a productive work. In Gujarat and Palanpur, they regretted very much not having adopted this principle, as several lakies of cottle, worth Re. 200 and Re. 200 a pair, were lost for want of forlder. If a little water had been stored the cattle could have been saved.
- 30. Q. Would you put any restriction on the rayats growing a certain kind of crop, or would you leave it to thou to learn by experience to do their own distribution?—As long as you can be certain of giving the water, I do not think that restriction is necessary.
- 21. Q. Would there not be a tondency to grow too much angar-cane. On the Mutha we hear that they can commend one hundred to one hundred and fifty ruppes per acre of cane; and that, in consequence, they grow as much as possible. Would there not be that danger here?—They should be taid that they may espect a certain amount of mater; and that they must arrange accordingly.
- 22. Q. We have had a proposition lately that no water should be given for came after a certain date, naless there is water to spare. Do you agree with that?—They might be given water on condition that they should continue the irrigation by wells.
- 23. Q. Would you make the charge smaller on account of this hability ?-Yeu.
- 21. Q. We have had a good deal of discussion on the subject of applications for water. Are they a necessity in your oplaion?—I should like to give the water to a village and let the people distribute it among themselves. At Vir there is a river with a nice supply, and here the people distribute the water by a panchayat and they never have any quarrels.
- 25. Q. From what you saw at Vir, do you think that it would be possible to apportion the water by regulating the size of the outlet according to the area to bu irrigated?—The people would tamper with the outlet. The water should be let into channels, and they should be allowed to take it. in take it.
- 23. Q Do you think that we could make an outlet that they could not tamper with?—Yes, but where you have a putker's there is always favouritism. It would be better to put the water into a tank and Irave It to the villagors to distribute.
- 27. Q. (Mr. Highum) With regard to sites for large reservoirs fed by rainfall from streams and rivers have you mentioned all that accurred to you as feasible athemes? - I had no time to mention all the sites when preparing my
- 28. Q. Then you have examined sites for other truks?— Yes, I examined the Gerha site at Wodaj, south of the Nim Canal. That is a very good site, a weir could be made there. It is an inland pocket, which could be fed by the brigation canal.
- 20. Q. Would that be an unfailing supply? In very but years, it might fail; it is in the Chats where there is a rainfall of 21 85 meles; it would fill in three years out of fire.
- 80. Q. I was thinking of sites that might be depended on annually. Have you seen the Maladeri Tank ?- I have not seen it.
- 31. Q. Are any storage tanks possible on the Godavari ?— There is a site at Raburi in the Ahmedmagar District. It is on the Mulla River. It has 800 square mites of catch-ment. There is some difficulty about the wasto weir, but it is a splengid site.
- 32. Q. (The President.)—We have been fold of another one near Poena on the Koina. And there are proposals, we are told, to make a storage tank in connection with the Godareri at Nasik. Do you know anything of these?-
- 33. Q. (Mr. Higham.)—Do you know of any other sites?—There is a site at the junction of the Mulla, and

Whiting.

10 Jan. 02.

Mr. J. E. Whiting.

- another above the Khadakwasla Lake. I examined a site near Bhusaval at a place called Raipur for a tank on the Waghar.
- 84. Q. Would it fit!?—It is in a very large catchment area; and there is more water than is wanted. The greater part of the water would run to waste. It requires a large waste weir.
- 36. Q. If you have a large tank, you must have a comparatively large area at your command?—If you nee it as a protective work, a minimum supply of the storage can he used, and the rest kept for use in bad years.
- 36 Q. Do you know of any taak in which a portion of the supply is kept from one year to another?—No, I think you loss nothing by keeping the water. I would make tanks larger than would be filled every year, in order that when you have deficient rainfall the Executive Engueer may have water for the people, who will be disappointed if they do not get water regularly. If they are given water one year and refused the next, the people lose confidence and won't taks water at all.
- 37. Q. Then you recommend two-year tanks?—Yes, I believe in large reservoire. In ordinary years, the orop would be guaranteed, and there would be a supply for fodder for the cattle. I proposed that a second tank above the Mhaswad height be constructed, so that the water in the lower tank should be supplemented, and the supply guaranteed.
- 38. Q. Does Mr. Beals know about that tank? -(Mr. Beals).—There was a proposal for a tenk above the Mhaswad which has been rejected.
- 39. Q. Would you never irrigate from the npper tank?—
  No, I would store it simply to give confidence to the people who irrigate from the lower tank. Some discouragement has been cansed, owing to the supply of the Mhaswad tank having sometimes failed.
- 49. Q. As regards your system of bandharas, you refer to a series of weire from streams that come down spasuudieally for a day or two P—Yes, I refer to streams that come down in short spoyts; they have steep slopes.
- 41. Q. What would you call stsep? -About 17 feet a
- 42. Q. You do not think it would be good for etorage, if it was more than 5 or 6 feet per mile?—Nallahs of steep fall are not good for etorage tanks—6 or 7 feet per mile is the limit.
- 43. Q. Without a storp slope, could not you get a good command?—The bandhurus I speak of are those in which the watershed is quite class. I would have a bandhara and then five or six tanke; then another bandhara, and so on.
- 41. Q. Are there any such works?—No, not in these Provinces, but in Sind they use that system for getting the water ou to their fields.
- 45. Q. Is there not a great difference between the requirements of water in the Decean and in Sind, where one watering will suffice ?—Yes.
- 46. Q When do the basins fill in Sind?—The basins in Sind fill during the flood in the south-west monecon, when water comes down from the Baluchisten hills; it is not then wanted owing to rain.
- 47. Q. What is your idea of the size that these basins should be ?—The basine should be large enough to give two or three waterings. If passible, they should be in two or three different parts of the farm.
- 43. Q. Are there suitable sites in every farm to build two or three of these tanks?—I es, when one is silted up wheat can be grown on it and another used for storage.
- 49. Q Is the country in this part of India as feasible for storage as that in Sind?—I have seen them in Purandhar, but, perhaps, the idea of two or three persons combining would be new to the people in this part of the country.
- 50. Q. You would not make any large tanks to be fed from the nellahs?—In Cutch, near Bhuj, there are places where weirs are made 30 feet high; but the people do not make them now.
- 51. Q. What would be the cost of bringing down enough water to carry the crops through the cold weather?—I don't think that the water will last beyond the mensoon—not generally for the rabi crop.
- 52. Q. Do you contemplate Government building tanks of its own, in addition to the village distribution tanks?—
  I den't think it will pay.
- 58. Q. You would pass the whole of the supply into little basios?—Yes, the weirs will have to be made very carefully.

- 54. Q. Would there be any danger of silt accumulating above the woir?—Yes; but the greater part of the silt will be good. There is not much sand in these nallahs.
- 55. Q. Would you recommend weirs with gatee; would that be an advantage; or would it be an uonecessary expense?—Falling gates would be good, but would be an unnecessary expense on small works. But sinices with wooden needles could be used.
- 56. Q. In the case of farms or villages, where it is not possible to find sites for storage, would you have the water directed into water-courses?—Yss.
- 57. Q. But you don't think that all the fislds will benefit equally ?—Many fields could be served in this manner.
- 58 Q. That would be where the slopes are etecp, more or less on the hills. Do they get famine there?—No, not on hilly lands like Bareda.
- 59. Q. In what district do you contemplate these bandharas?—In the Districts of Satara and Poons, in the Nita Valloy.
- 60. Q. That District is not at all subject to famine f-No, I only name it man case. In Sholapur and Bijapur the people would have prior claim to the submoutane tracts.
- 61. Q (Mr. Ibbetson.)—Would that system be possible in Sholapur and Bijapar?—Yes, I think it could be done, and where the slope is steep, the storage could be obtained in the nallahs.
- 62. Q. (Mr. Higham.)—I nuderstood that you propose the extension of this system even to u canal like the Nira, i.e., to allow each village to have a tank and to fill it nud distributs the water among themselves?—I think the Nira Canal water might be distributed in that manner.
- 63 Q. Practically you would sharge on the number of times the tank is filed?—Yes; you would have to be a little lenient at first, it would save the cost of measurers and other expenses.
- 64. Q. Surely it will be difficult to find sites in that flat country. Do you suppose you could get eites for two or three tanks in each village?—I think there are a great many tank sites to be found. There are tanks in almost every village. In Madias they have thousands of small tanks.
- U5. Q. Where you could not got tanks, you would still have to keep the patkari?—Yes.
- 66. Q. There you could not adopt the system as a whole?-No.
- 67. Q. Then tanks seem to me to be open to three objections: (1) You cannot find sites; (2) they would be expensive; and (3) they are likely to silt up, and now ones would have to be made?—The clearance of the silt of these tanks could be done by famine labour.
- 68. Q. Suppose there was no famine. There would also be less by absorption?—The less by absorption would go into the wells.
- 69. Q. Do you contemplate that these tanks should be made by Government or hy the people themselves?—By the people themselves.
- 70. Q (Mr. Rajaratna Mdlr.)—Where water is not available for tanks, could their place not be taken by outlets and the people allowed to open and shut them themselves?

  —Yes, I think that rould be done.
- 71. Q They could be opened by patkaris on particular days?—Yes. I think that could be done.
- 72. Q. (The President.)—We would be glad to have your advice as regards Kathiawar?—I would like to put in these miditional Memoranda which I have prepared in regard to works in Kathiawar.\*
- 73. Q. Have you had any experience of famine labours --- Yes.
- 74. Q. Could it be esefully employed on these bandhoras? - Such labour can be employed on the earthwork.
- 75. Q. The bands would have to be of masonry?—The bunds would be of earth and pitched; and where the water flows over, there will be longer vertical stores. I bave made such an escape successfully.
- 76. Q. (Mr. Mair-Mackenzie.)—The Nira Canal I managed as a protective work, i.e., the water is conserved for rabi crops. On the Matha, which is a productive work, all the water asked for is given for perennial irrigation? Do

\* Printed ante.

you not think that one system of administration would do P Don't you think we could monogo works like the Nira on the productive principle and give weter ficely far perennial cops if asked to do so P—No, there should always be a

77. Q. Was it at your instance that the Nira was monoged as a protective work ?—I think that it was done at my

78. Q. Are you satisfied that the results have shown the necessity for it ?-- I am very much in favour of storage for famine years.

70. Q. You say you are strongly in favour of extra Mr. J. E. storoga in view of famine. Do you mean you would Whiting, provide storage in excess of the demand, or that having the demand, you would still refuse water with a view to storing 10 Jan. 02. and guerantee weter for that amount always. The remainder I should keep as a reservo.

### THIRTY-FIRST DAY.

Dharwar, 13th January 1902.

WITNESS No. 82,-MR. H. Il. SHIRHATTI, Pensioned Deputy Collector.

Momorondum by Witness.

Dharwar district are:

With regard to the first three tanks I am unoble to give any elaborate description as I have lad very little time at my disposal to make inquiries about the details concerning these tanks, but I can only soy now that these tanks, especially the one at Bladog, have been the source of great help in irrigating a wast area of lands which yield different lates of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the source of the s help in irrigating a vast area of lands which yield different kinds of crops, ric., sugarcane, lemons, plantains, coconmuts, vegetables, etc. It is the greatest tank in this district; but I dare say that no tank of such extent and usefulness exlets anywhere in the adjacent parts of the country except in the adjoining Mysere Province. Indeed, this tank, irrigating as it does a large tract of land, holds a great cheek upon the effects of famine, and, if I mistake not, famine does scarcely assume a fearful aspect in the Kod and the other adjoining talukas, as compared with the talukas and districts lying at a distance. I know sometalukas and districts lying at a distance. I know some-thing of the Medleri and Asundi Tauks, because I have served in the Rauchenaur taluka as mandatdar there. served in the Rauchennur taluka as manilatiar there. Both there tanks, though not so extensively irrigating as the Madag Tank, do water a considerable acreege of land and yield crops such as those mentioned for the Aludag Tank, thought to a smaller extent. These tanks do not yield sugarcane on a large scale, but produce plantains, lemons, sweet potatoes, etc., and are therefore of very great use to the people. But I respectfully leg to propose that the irrigation lates may be reduced, as they are higher them the rates at such tanks as Madag and Dambal.

There are a few irrigating wells throughout the district of Dharwar. I may mention one or two such wells in the alundarci letha of this district, where I at present live, viz., the wells at Tambergandi and Ramonolalli in the said petia. These afford some relief to the ravats, who, by producing plantains, vigetables, and other minor crops, can drag on in times of scarcity without being obliged to go to the famine relief works to obtain subsistence.

I can also mention that from the channels of the big natis, which lokes its course near the village of Jentli and which runs by the villages of Meundi Tambergundi, Mundargi, Shirol, Byalawadgi, Bennehalli, and Ratl in the Mundergi Petha, many gurden lands are watered, yielding sandry crops such as puddy and those mentioned above and also eccurants. A special water-rate (not irrigational) is realized for the use of such water by the Revenue authoristics. I know for certain that these channels help the owners of the lands concerned a great deal. One of such land-owners is my son-in-law, who is a big land proprietor in this district. He obtains different kinds af crops, paddy, sugarcane, etc., and I humbly sulmait that other people wishing to have the use of this nalls, which is a very big one and capable of supplying ample water, may people wishing to have the use of the value, which were blg one and capable of supplying ample water, moy

Momorondum by Witness.

As far as I know, the chief irrigation works in the Charmar district are:—

(1) The Madag Tank in the Ked taluka;

(2) The Asundi Tank in the Banebennur telnka;

(3) The Medjeri Tank in the said taluka.

(4) The Dambal Tank is the Mundergi Petha of the Gadag taluka.

With regard to the first three tanks I am unoble to give any elaborate description as I have had very little time at my dispesal to make inquiries abaut the details concerning here tanks, but I can only soy now that these tanks, sunce and badog, have been the source of great.

Momorondum by Witness.

be allowed to ntilize the water thereof for irrigational purposes on payment af a smoll water-rate. If this thing Shirka it may unfortunately ocean, will be less felt by a certain potition of the people at least, as they can with a little trouble grow grain and regetables for themselves and for other people and wet jowari fodder for their cattle. This jowari, "neer jola" as it is called in Kauarese, is grown in fields having wells by a few prople in this petha as well as clearable to supply foddor to the cattle when there is a detailed description of the Dambal Irrigation Tank. This tank lles in two Revision Survey Nos., viz. :—

Acres Grather

					Acres.	Gunthas.

						-

Before the famine of 1876-77 the area of this tank was 300 acres. It was extended by 130 acres in that year.

In ordinary years, when the tonk is completely filled it irrigates 580 neres of land. In ardinory years, when the tank is full it holds 114,182 millions of ouble feet of water. tank is full it holds 114,182 millions of oubte teet or water. In times of drought it almost gets dry and cannot brigate any portion of the lands, but it is usual for the Irrigation Department to sell grave by auction for the year and also to rent out the bed of the tank for the cultivation of horse and other minor crops at fluctuating rates. This grain and other minor crops at fluctuating rates. This course is certoinly beneficial both to Government and the people, and I humbly recommend that such onliverion may ha more liberally encouraged by Government in times of drought.

The lands on which the consolidated rate is fixed measure 143 neres 29 gunthas, and the area on which no rate is permanently fixed but on which essessment is realized from year to year is about 110 nores.

The amount of meney expended on the repairs of this tank annually is about (its. 140) one hundred and forty. All kinds of repairs to this tank are carried out by the All kinus of repairs to this tank are carried out by the Irrigation Department, the village people not having to do anything in connection therewith. The distribution of water is controlled by the officers of the Irrigation Department, and a gauge clerk on a smoll pay is pastend at Dambal to look after the tank and to monoge the distribution of water. tion of water.

The following crops are grown by the water of this tank:—(1) harley, (2) jowni, (3) heans, (4) sugarcano, (6) paddy, (6) vegetables, (7, fruits such as gunva, plums, plantains, jamhools, lemons, (8) nauca, (9) navani, (10) hajri, (11) tebacco, (12) onions, (13) ohilhes, (14) methi, 15) garlic, (10) flowers, etc. Of these, sugarcane, guava,

Shirhatty.

13 Jan. 02.

3/2 Shirhatti. 13 Jan. 02. lemon, plantoin, and flower trees receive water for twelve months and are watered once in ten days. Brinjal and ohilly plants receive water for eight months and are required ohily plints receive water for eight months and into equiva-to be watered once in eight duys. Paddy, methi, onions, garilo, tobacco, and vegetables receive water for four months at the intervole of seven days; till (sesamum), jowari, navani, whent, horso gram require to be irrigated once or twice during the year.

The amounts of ifrigation rate realized over the lands irrigated are Rs. 10 per age at the Madag and Dambal Tanks and as high as Rs. 14 for those at Medleri and Asandi. It is understood that there is a proposal by the Irrigation Depurtment for the increase of those rates and I dere say that it is not in my humble opinion advisable to augment the present rates which are already high. able to augment the pressot rates which are already high. I say so because a great deal of money is required to be spent by the cultivator on the lands before he gets the crope home. In addition to the irrigution rates named shove the cultivator has to pay un ordioury assessment of one rupee per acre of land ne asso-ed by the Sarvey Department. Now I shall give some details of the money required to be expended by the oultivotor on different kinds of erops ever an acre of land.

For the sugmenne crops:—

Ploughing ,	Rs. 12 4 15 18	0000	0000	
1,000. Currying the seeds Weeding, 100 labourers Reaping the crops Water-rate Ordinary assessment Watch labourere For preparing jaggery for	1 6 10 10 1 40 48	0400000	000000	
6 doye at Rs. 8 a day.	165	4	_	

The yield of the jaggery from sugarcaue crops obtained for oix dayo' lobour not the late of 3 "Hers" of 8 mannds each, is 18 "Hers" valued at Rs. 150 at the rate of Rs. 10 a "Her."

	Rs.	٨.	r.	
Deduct the expenditure	180 • 166			
-	-		-	

14 12 0 is the net profit. Not only this, but in some years then et profit is as low as Rs. 4 or 6. This is certuinly a very poor gain far a rayat who has been devoting his whole time and the time of some of his family members for a greater port of

For guava, lemons, etc.:-

			Rs.
Clearing the lacd	•		. 12
Digging pits		•	. 2
Manure			. 2
Curriage of manure	•	•	. 1
Wnter-rate	•	•	. 10
Assessment		•	. 1
Labour for watching	•	•	. 40
			68

By deducting this sum from Rs. 80 we have a gain of Rs. 12, sometimes less than that.

Now for brinjol, etc.:—

			Re.	ı.	P.	
Ploughing .			10	0	0	
Mannro			8	0	0	
Digging pits .			1	0	0	
Furrowing	•	,	8	0	0

Wotoling					•	8	
Re-plunting	3	•	•	•	•	õ	
						25	

Dedact this amount from the yield, viz., Rs. 35, and the net income is its, 10 and cometimes less

The expenditars for the growth of plantains and paddy ranges between that of sugarcane and brinjuls.

I believe that this information is sufficient ut present for the purpose, and I hope to be able to give more information at the time of my evidence before the Irrigation Commission.

I know not of any remissions of the water-rate being given to the cultivatore when the tank fails and their lands remain nairrighted. Thie, I humbly submit, is not fair. Why the cultivators should pay when they are oupplied with no water I cannot anderstand. The rates are water-rates and need be paid only when water is supplied; and, besides, they have to pay the ordinary fixed assessment for the lands they hald the lands they hold.

The constructors of irrigating wells are often assisted by Government by indennees in the shape of tagni. In this respect I nm humbly of opinion that some concession should be shown to the constructors of such wells; for instance, the rate of interest he reduced and the periods within which such leans may have to be repaid should be extended. I seem to so for that in order to encourage the midding that in order to encourage the midding that is not a second or that in order to encourage the midding that is not a second or the second of the second or the second of the second or the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the sec even go so fur that in order to encourage the multiplication of such wells Government chould be kind enough to make of such wells Government chould be kind eacagh-to make advances to energetic bat certificated poor peopls without any interest at all for n certoin small number of years at leost. This course, if adopted, will had to the unmonical enhancement of such useful wells whereby to mitigate the ovil effects of a future scarcity or famine. Such works are to my knewledge, never undertaken by District Boards but by private land-owners from their own private funds solely, or being assisted by Government by the grant of advances, or purely from the tagai advances granted to their by Government. It has not been the practice of Government to eacourage the coostruction of such works by loans to District Boards.

The protective value of these works will undoubtedly be increased by devoting more money and grenter attention to their up-keep and by encouraging the constructors of new works. Enforcement of local responsibilities in this connection is necessary, and the Taluka Local Founds and connection is necessary, and the Taluka Local Enands and the village officers concerned should be held responsible for promptly bringing to the notice of the Collector, through the Maintadur or Mahulkari of their talukus or pethas, as the case may be, as to the necessity of the construction of now welle or repairs to the existing wells or other scorces of water-supply which may require immediate attention, both for irrigating purposes and for water-supply for men and cattle. This country is well known for scanty supply of drinking water and I have known instances in which men, especially women, have to carry water from a long distance, not to speak of cattle which, though they have plenty of fodder to eat, have to remain setisfied by druking water once during the whole day. What I beg to propose is that in olmost each village where or a running nalm or never-drying well, a well should be or n running naln or never-drying well, a well should be constructed by the Local Boards with a wooden or stony trongh attached therato for the cattle to drink water at.

In conclusion, I have to make na important anggestion In conclusion, I have to make na important suggestion for the construction of a bund over the river Tungabladra at the village of Korlahalli six miles from Mandargi. This bund was originally coastructed, though not completely, by the two brother ministers, ris., Danak and Muddapa, of the now extinct kingdom of Vijaynaagur, at present traceoble in the rains of the selebhated haly ploce of pilgriango. Hompi (the Poranik Kishkiada) in the Bellary district of the Madoes Presidency. This band will, I am afraid, cost a great deal of money and troable, but, if completed, will be a means of irrigating a year area of land, such as that be a means of irrigating a vast area of land, such as that done in the Bellary district and in the Mysore province. Best kind of rice, coceannte and other garden produce are grown to a large extent in the above said provinces by means of canals taken from this river, and much benefit is derived from it. It will certainly hon great been conferred upon the people of these parts if the work I have proposed will be corried out at any cost and trouble, and it will and ubtedly be a means of checking the occurrence of famine and will likewise afford pleuty of labour for faminestrickon people at a future famine.

I respectfully beg to add another important tank exist-ing at the village of Alugad in the Dharwar tuluka, which waters many, a paddy field yielding best kind of rice. This

- tank is not under the control of the Irrigation Department, and no water-rate is realized by that Department, but Shirkatti.

  a special water-tax is received by the Revenue Department in addition to the ordinary land ossessment. This 13 Jan. 02. tank is a big one and may be conveniently transferred to the Irrigation Department, if deemed advisable.
- I expect to collect fuller information as regards the other irrigation tanks and other works of water-supply by the time I shall have to give my cridence before the Irrigation Commission.
- 1. Q. (The President.)-You are Pousioned Deputy Collector Y-Yes.
- 2. Q. What districts have you sorved in ?—I have served in the districts of Bolganm, Bijapur, Dharirar, Ahmednogar, Kneik, Khandesh, and Kolaba.
- 3. Q. You know the district of Dharwar very well?-Yes.
- 4. Q. What districts were you in during the famine of 1676-77 and 1896?—I was manulatdar of Bijapur during the 1876-77 famino.
- 5. Q. And during the last famine?-I had retired before the list famino.
- 6. Q. You say in your memorandum " the brigation rates may be reduced as they are higher than the rates of such tanks as Madag and Dambal." You refer, of course, only to the rates for sugarcane?—Xes, the sugarcane rates are Rs. 14 per acre.
- 7. Q. What are the rates on the Asundi and Medlori tanks r-Rs. 14 for angarcane, its. 5 for 8 month erop. I think Rs. 14 for angarcane is too high. Under the Dambal tank, the crops are better and the rate is Rs. 10.
- 8. Q. The rates are not higher than those on other tanks. In Hijappr and Sholappr and other districts, the rate is Rs. 18 per nore!—That is very exerbitant.
- p. Q. Oo the Krishna Canal tho rate is Rs. 25 per acre? The people in this district are vory poor, and cannot pay such high rates. They are not prevented from growing sugarcane by the rates now charged?—They grow it because there is no olternative.
- 10. Q. If, Instead of lowering the rates of the Asuadi and Mediari tanks Government were to raise the rates of the Dambal tank, would that also satisfaction?—It would, I think, be a great injustice to raise the other tank rates to Rs. 14.
- 11. Q. You say "there are a very few irrigating wells throughout the district of Dharwar." Why are there not more wells?—Because the people do not get any assistance from Government. Unless Government give taken they cannot sink wells.
- 12. Q. Are no advances made in this district for wells? Yes; takavi is udvanced, but the system is defective.
- 13. Q. What is wrong with it?-If a man wants the advance of Ra. 100, he has to journey two or three times a distance of 30 or 40 miles with the patel and kulkaral, who have to be fed on the way, then the karkans at the taluka office have to be pleased; and the man may lose as much as Its. 25 out of the 103.
- 11. Q. What do you propose as the best means of meeting the case? Wo all feel that the system should be made as easy and simple as possible!—I would propose that several central towns should be selected, in each of which a pensioned officer, or a respectable private person should be empowered to distribute Government takeri. He might be a zemindar. The man should be responsible to the mambat-
- 15. Q. Would you pay the man anything for the trouble he takes !- No, he should do the work gratuitously.
- 16. Q. Would be make any restrictions with regard to giving odrances to an insolvent man?—He should give advances on the basis of the fand owned by the man.
- 17. Q. But how would this agent find it aut?—The man tying the monoy, would got the Information from the mamlatilar.
- 18. Q. How long does it taken man at present to get an advance to make a well?—He gets it in two or three months; but he wants it in a week.
- 10. Q. How much does the man get t the whole amount or only a part?—The advance would be a pertion of the cost of the well.

- 20. Q. Who deeldes how much should be given ?- The Collector.
- 21. Q. You must have given out a great deal of money when you were a mambatdar ? No, the system was not in force in my time.
- 22. Q. You say that a man gets a quarter or one-third of the amount necessary for a woll: what does he do for the rest?—The rayat may be given half of what he asks: the remainder he has to supply from his own pocket, or he may barrow it from the sowers.
- 23. Q. Are there many whn go to the Sowear for the whole amount in proference to the Government?—Since the introduction of the new Land Rovenne Act, the sowears are not melined to advance much.
- 21. Q. Sappose the man gots his money, does he complain of the rate of interest?—No, the rate of interest is not high, compared with what the sowcar charges; but the number of instalments should be increased. The instalmonts are taken too soon.
- 25. Q. The law allows twenty years?—That may be, but the custom is to allow ten years only. I think the period should be extended to 20 or 25 years.
- 20. Q. You say "I can also mention that from the channel of the hig nata, which takes its course from the village of Gontli elsewiere \* \* Many garden lands are watered, yielding sundry crops, such as paddy and those mentioned above, and also coconnuts. \*\*I know for certain that these channels help the owners of the lands concerned a great deal." Where is the place of which you write situated?—Genthi is in the Gadag taluka.
- 27. Q. You say that a good deal of Irrigation is done from these channels? Who made them?—They were made about 50 years ago by the rayats with Government senetion. They pay a special water-rate.
- 23. Q. I do not know what you mean by "a special water-rate, not irrigational?"-A rate is levied by the Revenue Department with the ordinary assessment.
- 20. Q. You say, "other people wiching to have the use of this nata \*\* may be allowed to ntilise the water for irrigational purposes or payment of a small water-rate." Who present them now P-No non-ovocers may use the water without the permission of the Collector.
- 30. Q. Then there are rertain land-owners who have a right to the water !- Yes ; no others can usa the water.
- 31. Q. You say there is pleaty of water thore ?- Yes, plenty and to spare.
- 32. Q. Do the people who use it not allow other people to use it P.—The Collector has to eauction the use of the water; but in many cases he does not give exaction.
- 33. Q. tMr. Ibbetson.)—Have you over known the people to apply, and to be refused permission?—Yes; I have known of people applying and being refused sauction.
- 81. Q. (Mr. Muir-Mackenzic.1-Do you know ou what grounds the conction was refused, and can you tell us of
- 35. Q. (Mr. Rajavalna Malr.)—Perhaps the owners of private works and the present irrigators prevent others from taking the water?—The abaumels were built 150 years ago; and I think that the present rayats obstruct the use of it.
- 80. Q. (The President.)-You say I have to make an important arguestion for the construction of a bund across the river Tungahhadra. Has that project ever been examined P-1 think the matter was releved to the Irrigation Department some years ago; but it was decided as impractionable by the Executive Engineer. I hear that a blandara can be constructed at Hangi ten miles to west.
- 87. Q. Do you propose to make a big reservair there?

  Yes, there is a big ruined "hamlhara" at Korlhalli which also I should like to see reconstructed. The river on one slde belongs to Bombay and on the other side to Madras.

Mr.

Mr. Shirhatti. 13 Jan. 02,

- 38. Q. You say that you "beg to add another important tonk existing at the village of Mugad." How much does that irrigate?—About one thousand acres. It is situated obout seven miles from Dharwar.
  - 39. Q. Is it a second closs work ?-Yes.
- 40.Q. (Mr. Higham.)—Why do you propose that this tank should be transforred to the Irrigation Department?—Because it is a big work, yielding a lorge revenue; and would be better managed by the Irrigation Department than by the Revenue Department.
- 41. Q. What would be the offect of the transfer?There would be better supervision and better control.
- 42. Q. Whot rates do the peoplo poy now ?-Rupees 6 per ocre.
  - 43. Q. Is that o consolidated rate?-Yes.
- 44. Q. If the tonk is transforred to the Irrigation Department, would the rates be affected ?—Yes; perhaps they would raise it.
- 45. Q. It cannot be incressed, if it is a conselidated ato? —The Irrigotion Department may increase the water-
- 46. Q. I do not understand why you want the tank transferred f.—Because it would be under better control. At present there are disputes about the distribution of the
- 47. Q. Have you had anything to do with those disputes P-No, I have not.
- putes r—No, a nove not.

  43. Q. Cannot the people manage the distribution of the water botween themselves?—They querrel about the quentity, and nader present circamstances, the matter goes to the Collector, who notors it to the mamlatan; who sends it on to the Circle Inspector, and great delay occars. If the tonk is under the Irrigation Department, the sub-overseer in charge goes immediately into the matter, which is quickly disposed of.
- 49. Q. Are there mony dispates which have to go before the Collector f-There may be several.
- 50. Q. In many places the people arrange the distribution among themselves?—They go to the Collector when they counct sottle the disputes among themselves.
- 51. Q. You hove 1.000 acres under irrigation, how many villagee are there !-- Five or siz.
- 52. Q. Are there disputes between village and village? -No; generally between people of the same village.
- 53. Q. Are there no disputes between one villago and another?—Very seldom.
- 54. Q. Would the people prefer to have their disputes settled by the Irrigation Department?—Yes; because their disputes would be disposed of with less delay than by the Collector.
- 55. Q You speak of irrigotion from hig nalas, on which special water-rates or charged. How do they get the water on to the land. Do they lift it?—They have open canals.
- 56. Q. Hos each village a separate canal of its own ?-No, one conal passes through several villages.
- 57. Q. How do they clean the canol?—They have parli-ouler limits up to which they have a claim ou the water, they know where their limit ends.
- 58. Q. I suppose they have to clear them sometimes. Who does the clearance?—The rayats clear them themselves.
- 59. Q. If several villoges are interested how do they arrange their shores?—The rayets of each particular village clear the canal in their own limits.
- 60. Q. I suppose there is a lot of eilt at the head of the canal P—Yes, they remove that.
- 61: Q. Whot rates do the payats pay?-They pay Rs. 2 per acre, in addition to the ordinary rate,
- 62. Q. You say that there is always woter in these canals !- Yes.
- 63. Q. Was there water during the famine year ?- No.
- 64. Q. The effects of fomine woold be less felt, if tho people were ollowed to take water from the nata?—Yes; it is not always that the nata is dry; but only in very bod
- 65. Q. Is it the practice to enlitrate the beds when the tonks are dry?—Gram and minor crops are grown: they pay a certain rate of assessment. Some of the ground is sold by anation, and is let to the highest bidder for a period of one year.

- 66. Q. Wheo do they sell it?-When the tank becomes
- dry.

  67. Q. Whom does the land on the banks belong to P—
  The bed of the tonk belongs to Government. The land on
  the tank belongs to the cultivator.
- 68. Q. Where are the anctions hold ?-On the site of the traks ?
- 69. Q. Who holds it?—The sub-overseer, or, perhops, the moistry, and some times, the higher officers hold it.
- 70. Q. Do you do this in case of all tanks !- In most of them.
  - 71. Q. Is there much competition ?-Yes
- 72. Q. Regarding the Dambal tank, you say that 143 ocres are under consolidated rates and 110 a res under wet rotes, that makes 253 acres altogether; yet higher up you soy the tank will irrigate 500 acres. The tank covers 300 rotes, that makes 203 acres attogether; yet higher up you say the tank will irrigate 500 acres. The tank covers 300 acres, and does not irrigate more then 253 acres, i.e., i irrigates a little less than the orea it covers.!—I cannot account for the difference. Perbops the Irrigation Department can explain the matter.
- 73. Q. There is also cultivation in the bed of the tank?
  -Yes, there is cultivation in the Dambal tank in most gears.
- 74. Q. Is grass, which is grown in the bed of the tank also sold?—Yes; it is sold in the villages; and the people from the adjoining villages come to purchase it?
- 75. Q. What do they got for it ?- Something very tring. The people generally use karbi here.
- 76. Q. Suppose Government to make a new tonk, must they pay compensation for the laud?—They must purchase the land.
- 77. Q. Suppose that Government allow the lond to romain with the owner, and let him oultrwate it, would the people object to that?—The people would be hencisted, and they would be glad to have the use of the land.
- 78. Q. Would the people profor that Government should hay the land or let the people setoiu and cultivate it?—They would like to retain the land,
- 79. Q. As a matter of fool, Government always buy the land?-Yes, they can toke it by force under the Land Acquisition Act.
- 80. Q. (Mr. Ibbetson.)—How long have you served in Dharwar?—Five years.
- 81. Q. Straight on?-Yes, four years as mamlatdar and one year as Deputy Collector.
- S2. Q. When did you last serve here?-Fifteen years ogo.
- 83. Q. Whon did you retire .- I retired in 1890, and I have lived here since.
- 84. Q. The whole district is not liable to famine; is it? The costern portion, which is accept one-third of the district, is liable to tamine.
- 85. Q. Does the western portion not suffer ?- No, it has not much suffered since 1877.
  - 86. Q Were you here, then ?-No, I was in Bijapur.
- 87. Q. You know, as a fact, that there was famine in the western portion in 1877?—Yes.
  - 88. Q. And nover since ?-No; not much.
- Sc. Q. In the castern third, what famines can you re-call?—There was famine in 1895,1896, 1898, and the dis-trict is still suffering from femine. In 1876 and 1877 it was very bad.
- 90. Q. What was the state of offairs in 1891-92?—There was secreity: I would not call famino.
- 91. Q. Are there any tanks in the eastern third of this extirt?—No, there are no irrigation tanks; because of the block cotton soll.
- 92. Q. Is it all black cotton soil?—Yes, except in n few cases.
- 93. Q. There are no wells in the eastern portion ?—No, not many and fer the same reason.
- 94. Q. If the people had water, would they irrigate the black cotton soil?—No; it is no good for irrigation.
  - 95. Q. Not even for high class crops?-No.
- 90. Q. What is the depth of the soil?—Three or four feet, and then there is rock.
- 97. Q Then there are no tanks or wells ot all in the eastern territory ?-No, there ore only, drinking tanks and drinking wells to some places.

Shirhatti.

- 98. Q. And you don't believe that if they had water they could irrigate black cotton soil  $P \rightarrow No$ .
- 99. Q. Is there only one canal in the eastern part?-
- 100. Q. It irrigales 5 or 6 villages ?-Yes.
- 101. Q. They do their own distribution; and there are very few eispnies. Then why is there so much trouble in regard to the Mugad tank? If the people can manage the distribution of the canal veter, why cannot they manege it on the Mugad tank? What is the difference between the two?—The quarrels on the Mugad are due owing to the tank being an ancient one. The rayats get rich raddy crops; and the people sometimes fight over the quantity of water. Perhaps the people are more quarrelsome there.
- 102. Q At any rate, it is possible for the people in this district to arrange the distribution of water without disjutes?—Yes; but not on the Mugad tank.
- 103. Q. Is the elegrance of channels done by the rayat's own labour?—No; they generally employ labourers to clear the Gentli channels and sometimes the poor rayats clear the canals themselves.
- 101. Q. What is the annual cost of clearance, do you suppose ?—They are not cleared every year, but only once in two or three years. It must cost about Rs. 100 (one bundred), that is morely my ostimate.
- 105. Q. Have you ever heard of disputes of the spiortionment of this Re. 100 ?-No.
- 106. Q. You say that on the l'ambal and Medlori tanks the rates are Rs. 1:1 per acre: is that for all crops ?- No, for sugarcane.
- 107. Q. Is all the water in these tanks used?—Yes, there was never an left.
  - 108. Q. They Will use; but they cannot get it?-Yes.
- 109. Q. Then why do you propose to reduce the rates? Because in famine years, there is no water, and they still have to pay.
- 110. Q. Is no remission given F-The rate is a consolidated one, and no remission is given.
- 111. Q. Is not the lond measured up; and then a charge is made?—No, the charge is a consolidated one, and the money is pold in advance.
- 112. Q. The rate of Rs. 14 is not consolidated?— The Rs. 14 is charged for the water they take for their lands. Even, when there is no water in the tanks the assessment is charged, and no remission is given.
- 113. Q. Do I understand you to say that its. 14 is charged though there is no water in the tank P.-Yes.
- 114. Q. (Mr. Muir-Muckenzie)—Who takes this rate? The Revente Department or the Irrigation Department. It counds impossible. Mr. Beale, perhips you can help us?—Mr. Beale.—There is no charge when the water is not taken.
- 115. Q. (Mr. Rajaratna Mdlr.)—On Gentli nala a special rate for irrigation is charged?—Yes, Its. 2 on note for water advantages, independently of the land assessment.
- 116. Q. No matter what crops are grown?-Yes; they generally grow sugarcane and regetables.
- 117. Q. What area is assigned to each rayat?—No definite area is fixed; some have five acres; some have six; none less than two acres.
- 118. Q Can they sell the water to other rayais? No, unless they sell their land also.
- 110. Q. The nala was constructed by the rayals at their own expense and the water practically belongs to them. Can ther sell it and lovy a noter-rate just as Government does? No, they cannot sell the water.
- 100. Q. Why should they not rell the water and allaw other people to irrigate?—It is not the custom.
- 121. Q. Is there anything to prevent them from doing so?—I believe there must be some departmental order preventing them from doing so.
- 122. Q. Is there water available for the irrigation of an additional area?—Yes, about 40 or 50 acres more may be irrigated, if sanction were given, as there are other willages through which the nala runs.
- 128. Q. Could it be utilized without affecting the interests of the owners of the nala?—It could be done without interfering with their interests.

- 124. Q. Then why do the owners object to supplying waler to other people?—Because the supply will be less for their fields.
- 125. Q You say that 40 or 50 extra acres could be 13 Jan. 02. irrigated P—Yes; but the owners wen't allow it.
- 126. Q. Suppose we allow them to levy a water-rate. Do you think they would consent?—No, they would never council.
- 127. Q Would they not make a profit?—No, they think they would be lesers thereby.
- 128. Q. What is the area they irrigate now?-About two hundred neres.
- 129. Q. If water is available for 40 acres more why should they object, if they are allowed to lavy a water-rate of, say, Its. 2 an acro?—The present rayats would not be benefited.
- 130. Q. Has your son-in-law applied for permission to irrigate more land?—No; he is a 2nd class Sirdar living at Mundergi.
- 131. Q. Does he now object to the extension of irrigation ?—Yes.
- 132. Q. Ilas he any other land under the nala, besides that already referred to?—Yes.
- 133. Q. Has he applied to the Collector to irrigate that ?-No.
  - 134. Q. Why not?-I cannot say.
- 135. Q. As regards takuvi loans, you say that corruption of the village officers and delay in payment deter people from applying for advances freely. And you propose that committee of influential native gontlemen should be appointed. What guarante have you that they will behave any better than the village officers?—They will be people of pesition and, therefore, houest.
- 130. Q. Do you think it would be safe to go on the result of their inquiries?—Yes; they would have to ask the mambathar's assistance in their enquiries.
- 137. Q Would they not be alraid of the tabsildar coming down upon them?—No, I dun't think so, because they me men of position and often-times educated.
- 139. Q If the money is misspeut, would not the tahsildars of one down upon them?—No, they would harly misspend the money.
- 132. C. Then, why cannot the tabelliar do it binself:—Recause he has to travel, and if he had to give advances the people would have to travel, which would be very troublesome.
- 140. Q. He can make inquiries in the villages be visits?
  —Yes; but he may take two years to go round in his taluka, and he might have criminal and other cases to attend to.
- 141. Q. As regards the disprice about the distribution from the Mugad tank, why do the people not go to the Circle Inspector, instead of to the Collector, to have their disputes settled P—The Circle Inspector draws its. SO (thirty) a month; and ie has multifurous duties to perform, the extent of his best extending over forty villages.
- 142. Q. You say that the profit from cane caltivation is its, 14-12-0 per acre. Do you speak from personal experience !—Yes, from personal experience and from information from my son-in-law, and other practical mon.
- 113. Q. I want to know if your estimate of Re. 14 12-0 is not very los P-No, it is not very low.
- 141. Q. We have had any mnount of evidence to show that the profit on sugarcane has been more than Rs. 100 per acro f-My experience relates to the Dambal tank only.
- 146. Q. (Mr. Muir-Mackenzie.)—Have jou ever grown sugarenur on your own lands ?—No. My son-in-law gots 18 liers of "gool" per nore.
- 146. Q. How much is one her?—Eight hundred and thorty-two tolas make one her, 20 tolas make one ser; and one her is valued at Rs. 10; and 18 hers is equal to Rs. 180 in value. He spent Rs. 105 to raise this crop.
  - 147. Q. Then it does not pay ?- It gives him some return.
- 149. Q. What is the measurement on that land?—Rs. 10 water-rate; Re. I land assessment per acre.
- 140. Q. It will pay him better if he cultivate dry orop?
  —Yes; but the rainfull is so scanty that a cron enuner ha

- Mr. 150. Q. (Mr. Rajaratna Mdlr.)—The average area inigated per well in Dharwar is given as 4ths of an ocre, os compared with over three nores in Sholapur and 2.27 in Bolgaum. Can you explain the difference?—I connet.

  151. Q. What is the average area irrigated in Dharwor per well?—From one to five acres.

  - 152. Q. Have you say reason to suppose that it is less that in Bijapur or Belgaum?—I see no reason for any difference between here and Belgaum.
  - 153. Q. There are about 2,400 irrigation wells in Dharms. Are there any facilities for the construction of more? -Yes, a fow more could be constructed.
  - 151. Q. Do you think that the rayate could be induced to construct if Government romitted the water-rate?—Xes, if the water-rate was exempted for 'n certnin number of years, n few rayets might do so.
- 155. Q. What period of exemption would you suggest? Twenty years.
- 156. Q. Yoo say that "I oven go so far that, in order to caccurage the multiplication of such wells, the Government should be kied enough to make advances to caccyclic certified poor people, without any interest at all". To what extent do you think the number of wells would be increased in the whole district? Would it be doubled if this concession were allowed?—Perhaps one hundred wells in each of the cloven talokus. Eny, one thousand altegether. That is the maximum limit. the maximum limit.
- 167. Q. (Afr. Ibbelson.)—Including the three black soil talukas ?—No, the three eastern black soil talukas must be excluded except, a few villages in the Mundargi Peita of the Godog taluka, and a part of the Ron taloko.

#### Witness No. 83 .- Mr. JANANDAN SADASHIT Athoric, Pleader, Gadag. Answers to printed questions.

Mr Atharle. 13 Jan. 62

As very little time was nt my disposal I could not collect information for the whole district of Dhorwar. Dharwar district has cloven tolukas of which Gadag Is one, I am a resident of Godag and any laformation that medicate to Gadag is equally applicable to Navalgund and Iton Talnlas, as the character of the soil and cluaatic influence are one and the same. I therefore confine myself to Gadag Talul:a.

Point No. (2) (a). The gross and culturable meas and the proportions of the latter which are protected by Gov-ermount irrigation works, by private or village works, or by wells respectively are as follows:—

- \* Acres gross area.
- Acres culturable area.
- 550 Acres protected by Government irrigation work (only one tonk at Hambal, a petha town in Gadag talaka). The bed of the tank is 436 acres and the mea of the feed channel is 70 percs. 4 gunthus. This tank holds water 114 182 millions of cublo feet, or 11 feet hands when the full. height when full,
- (b) Character of the coil.—Black, red, the mixture of black m d red and eard, and ted with eard.
- (c) Extent to which cultivoten is dependent on artifi-

  - (d) Reinfell .- 24 inches.
- (e) Is there ordinarily a demand for water in the Decem during south-nest monoton?—Ver, and the mere so or greater the demand if the inhifull in the purposes year Lad Iallen short of the average.
- (f) What are the enqs which require irrigation and how many waterings do they require and at what times of the year?—I'addy, sugarcane, plantom trees, betel-leaves, guerra, lemen, and pamegranate trees, onicas, potatos, chillies, and all sorts of regetables and telesco. All their require two waterings in a week throughout the year until the crop is ready for harvesting, but one will do when the reins fall in sufficient quantity. I say throughout the year because the duration of the crops is not the same as shown below: ebown below:
  - Paddy -Two cross six-monthly, November to April and May to October.
  - Sugarcare.-One crop, cleven or twelve weaths from February.
  - Plantain trees.—Only one crop twelve mouths after plantation from June. The stem is preserved because the original tree treets young ones which again yield fruit in their tora. The stem of the mether-tree is preserved for three years.
  - Belel-leares.—Two crops every six months. Plants live for ten years if well nourished; first crop is raised three years after plantation.
  - Guara, lemon and porsegravate trees.—Two erers, one full and the other half. First erop is mised twelve months after plantation if will nontished. The former trees live for upwards of 35 years and the latter six years.
  - Chillies .- Only one crop in twelve months and no more.

All other regetables. Only one crop in six months ond no more.

- (9) How is the distribution controlled?—By Irrigating well-water by means of a mot (a leather bog containing 12 to 16 ghadas or 80-40 gallons of unter).
- (2) And in what form is irrigation arrenno maliad? The revenue is realized by consolidated assessment collected by two instalments, or by fixing a water-rate or tax on lands not subject to consolidated assessment, but receiving rater from Government tunb whenever there is a samples after giving it to the owners of lands subject to consolidated assessment.

Point No. 3.—Experience as regards black soil. Small tanks constructed in black soil hold rater and high earlien dams can be made enthunt traspary core walls. In the rate of hand being irrigated, being black soil, there is no demand for water during resons of average rainfall. But even in short drought there is decaudd for water. In such soils the irrigated ares does not show a falling-off in years of fair or good rainfall owing to slack demand and the returne is not more precurous on this menunt than on tanks commanding other classes of soils. These has been a desire for irrigation works on the part of owners of black soil, and the construction of tanks for such soil is considered reminerality of a supportant in for other classes of soil. But the cost of constructing tanks in such soil is comparablely very large and pilrate owners of lands cannot be expected to constitut the tanks with the Ir noise without free leans from the sarbar on her rate of interest and a long period, say, 20 years, for repayment of the I am.

Point No. 6—District or Village verks.—The dis-

Point No. 6—District or Village works.—The dis-trict or village works are constructed by the joint funds of the particular village in which the tank is constructed, the District Local Board and the Government grant. But the cultivation is not dependent on them as these tanks are constructed for the purpose of drinking water both for non and eattle. Ordinary regains to such works are conde constructs for the purpose of crinking water both for ten and entile. Ordinary regains to such works are reade of the cost of the villagers and extract living or aspecial regains at the cost of the District Local Tourd or of both. To all these auts of tauls there is but one exception and it is the tank at Dambal, and the higheregate extent of enli-ration dependent on this tank is 600 arres and the Govern-ment is re-possible to maintain it under the Irrigation Act. The appraise a namel expenditure increased by ment is responsible to maintain it under the Irrigation Act.
The average annual expenditure Incurred by Convenuent on this work is 18, 149, not including expenditure in relief work doring late families. Irrigation is realised or remissions of land revenue are given according to the orders of the Government when the works fail. No non-works of this class lare leen constructed of late years; nor even as frames aware. Such works are not undertaken by Institut Beards or by private lands where as they are not permissible under the District Local Peards act and are beyond the means of the District Boards or private landsowners. It is not desirable that District fonds should be expended on such works unless the Government gives loan to the District Boards. It has not been the practice for Government to encourage the construction of such works by loans to District Peards. The protective value of these works can be increased by diveting more money and greater aftertion District Peards. The protective value of these works can be increesed by directing more money and greater refeation to their up-keep and by encouraging the construction of new works. Local respeciabilities might be inferced in this connection by permanent increase in consolidated resenue and by making the continuar village or district benefited by the new works hear a certain portion of the cost incurred by Government or by the Plattlet Boards with the help of the

٠1

Government. Construction of such works as concerning village water-supplies for men and cattle is equally important.

Point No. 7.—Total area irrigated by wells in ordinary years is acres, and in years of drought is acres. The number of new wells constructed annually during last ten years is as shown below:—

	1893.	1993.	1891	1896,	1896.	1807.	1808	1899-	1900.	100°.	1002

Government has assisted the construction of such works by making advances, viz., Rs. No concessions are given to the constructors of new wells. It is possible and desirable to stimulate the construction of new wells by more liberal advances and inducements. More than half the

- 1. Q. (The President.) You are n pleader and practise at Gudug ?-Yes.
- 2. Q. You no n native of that place?—Yes; I know the taluka very well.
- 3. Q. The information you have given in your printed memorandum is about that talaku !---Yes.
  - 4. Q. It is in the eastern part of the district P-Yes.
- 5. Q. You say that paddy requires two waterings a week throughout the year. Is much paddy grown in your taluks from November to April?—Not in my taluka. Much is grown from May to November. In the adjoining taluka it is grown from November to April.
- 6. Q. You say, "There has been a desire for irrigation works on the part of owners of black soil and the construction of tanks or such other works is considered remnnerative and as important as for other classes of soil." Is that deep black cotton soil?—Yes, it is deep black soil.
- 7. Q. Do the people irrigate it?-No, but they want to do so.
- 8. Q. There is only one tank in your talnkn—the Danhal ?—Yes, they grow paddy, sugarcane, and vegolables under it.
- 9. Q. Do they grow cotton, and would the poople take irrigation for that crop?—Yer, they would irrigate cotton; they do not irrigate it now.
- 10. Q. To point 6 you say, "The district or villags works are constructed by the joint funds of the particular village in which the tank is constructed, the District Local Board and the Gaverament grant." Does the District Local Board have much to do with irrigation tanks f—No, the tanks referred to are drinking water tanks.

number of wells have been affected by the droughts of 1899 Mr. Athavle—1901 as shown below. Some of these which ran dry were despensed; and the result was that the average annual 18 Jan. 02. crop was obtained to a fair extent. Number of wells that failed or were ahandoned cannot be ascertained, but is very small. Average depth of water below surface is 12 to 15 feet, that is, if a well be sunk 40 feet deep, water is found 28 or 25 feet below surface, and the depth of water is 12 or 15 feet. Cost of wells used for irrigation and area served by each are as shown below:—

Cost in rupces.	Dimensions.	Area served,	Bomarks,
'			
8	A		·

- Note.—Only five days were at my disposal, and I could not get the figures in time. I shall forward the figures later on or give them at the time of giving evidence before the Commission.
- 11. Q. Does the Dambal tank do a great deal of good?-
- 12. Q. What happens to it in a year of drought, does it dry up P-Yos.
- 13. Q. (Mr. Muir-Mackenzie.) How is the water-supply obtained generally for the villages in the Gadag taluka?—The water-sopply is generally obtained from wells.
  - 14. Q. How deep are the wells ?- About 40 to 60 feet.
- 15. Q. That would be the nead depth to which a well would have to be sunk if it was wanted for irrigation?—Xcs.
- 10. Q. What would be the cost of such a well ?—A well 80 to 40 feet in diameter would cost about Rs. 4,000, and more if the seil is loose and gives way if not built with stone and chenam.
- 17. Q. Are there not smaller wells P—Yes, some are 20 feet in diameter, but never less.
- 18. Q. How many mote would there be on such a well?— Two mote if the water-sapply is good, otherwise only one met.
- 19. Q. How many neres would a well of that size irrigate P-A 20 feet well would irrigate about 5 acres.
- 20 Q. (Mr. Rajaratna Mudaliyar.) Why ore the wells so big; would not a well 10 feet in diameter does well if it was dug deeper?—No.
- 21. Q. (Mr. Muir Markenzie.)—Why not P-A small diameter would not do, as sufficient water weald not be obtained.

WITKESS No. 81 .- ME. O. C. BOYD, I.C.S., Acting Collector of Dharwar.

- 1. Q. (The President.)—You are Collector of Dharwar?—Yes.
- 2. Q. You'say that very little is taken in the way of takavi for wells !—Yes, very little for wells. In Belgaum, where I was for six years, you cannot sink wells in black cotton soll. And you can hardly do so in this district; consequently there is a small demand for takari for that purpose.
- 3. Q. Is the grenter part of the district black cotton seil P-No, only ene-third. The western part is hilly and woody and gets lots of water. And there is very little demand for wells.
- 4. Q. In the part where there is black cotton soil they don't want wells. Is it because the spring level is so low f-Yes, they have to go down 100 feet to get water, and then they find that it is brackish.
- 5. Q (Mr. Ibbetson.) Is the black soil very deep?—From seven to ten feet.
  - 6. Q. What is below ?-Sandstone and rock.
- 7.  $\bar{Q}$ . Supposing the people are given wells for nothing, could they use them ?—No.

- 8. Q. Having that source out away, and considering there is a distinct famine zone in this district, we are thrown back apon lanks and canals, whet would be the prospect of the people in the black cotton soil districts, taking water?—Tanks and canals are the only form of irrigation works for this district. The Gekak runs through black cotton soil; and has magnificent crops, but the soil is only three to five feet deep.
- O. Q. Why nre there so few tanks in this district?— There are very few big works; but there are 2,000 small village tanks irrigating from two to four hundred acres, on which consolidated assessment is charged.
- 10. Q Are these tanks in good order ?—They vary very much. They were built hundreds of years ago. No one knows by whom. Probably by some previous Government or by some rich people. The people under them are now not rich enough to unintain them. Government levy a low consolidated rate, and does not grant remissions.
- 11. Q. Have the people a feeling that they have elsewhere, that it is the business of the Government to keep them in order?—Yes, they think that the Government should repair the tank. When the people pay the 10 per

Mr. Boyd. 18 Jan. 02.

Mr. Boyd. cent., which happens in very few cases, the tank is repaired:
not otherwise. I would like to suggest that the 10 per 13 Jan. 02. cent. contribution be abolished.

12. Q. Would you recommend that all the tanks should be repaired as money and officers are available?—Yes. I may mention that Mr. Shankridgo etates that owing to the 10 per cent. contribution he can only spead Rs. 60,000 a year, whils the establishment toost is also Rs. 60,000; whereas, if he could spead four times as much, were it not for the 10 per cent. restriction.

[Mr. Muir-Mackenzio.—I don't think I am promature in announcing that Government have desided to abolish the 10 per cent. contribution for repairs of tanks.]

[Mr. Rajaratna Mudaliyar explained that the Madras Government repaired all small tanks by the agency of the

- Government repaired all small tanks by the agency of the Roveaue Department.]

  13. Q. (The President.) De you think that Government, having once put these tanks into repair, should go on maintaining them, or do you think it would be for the people to keep them in repair?—I de not think the people have the capital or the cambination to do it.
- 14. Q. You say that the people don't mind takavi in ten years?—No, the people do not object to paying back the takavi soen, if they get any heaefit from it.
- 15. Q. You are not alluding taken; for wells, because the people do not take any for that?—No; I was allading to what was said at Lijapur regarding the fact that the people do not like to pay back the taken; soon.
- 16. Q. Whon the oultivator herrows from the Sowcar, he never proposes to repay?—I have given out many thousands in takari; but I have not heard a single instance of people heing unwilling to return the loan in time. When cultivators borrow from a Sowear, they in many cases mean never to rapay and expect to pay the interest ne long as they live. Their custom is either to pay a debt soon or not at all. Thay take takari, meaning to repay it and knowing they must. So they are quite willing to repay it fairly soon.
- 17. Q. Do they complain at all of the rate of interest charged?—No, the Sowear charges from 30 to 40 per centre But they do complain of the delay in getting the advances. That is a question morely of having a larger establishment.
- 18. Q. If we are to bave protective works in this dietrict, and wells are not possible, we must have either tanks or canals. I understand that certain projects have been prepared; can you meution any of them?—Instructions were left to me by my predecessor to push on several of them in case of future lambus occurring in this district.
- 19. Q. Which is the most important of them f-A new tank at Pudkalkati which is north of Dharwar.
- 20. Q. Is it n small tank?—No, it is a new tank, which will cost 6} lakhe of rupees, and will prove useful to the North-West Frontier of the famine area.
- 21. Q. Would it get a good water-supply ?-It is bound to be successful.
- 22. Q. Of course the anxiety is that tanks not connected with a rainy zone may fail in dry years ?—Part of a catchment is in a sphore which is generally well supplied with
- 23. Q. There is austher tank at Kardikop in the Habli talaka, six or siven miles from Huhll?—Yos.
- 24. Q. (Mr. Muir-Mackenzie.) That is rather far from the famino tract P—Yes, that is true, ahout 25 miles.
- 28. Q. Are there any other works that you would like to mention?—Yes, the extension and repairs of the Dachal tank. This tank is in fumine area and is very neglel. All these are very important. The most important of them, however, is Pudkalkatti. We could casely spend 18 lakhs or 14 lakhs very neofully on these works if Government could let us have it. I see at page 338 of Mr. Beale's report that Mr. Strange condemned the Padkalkatti tank, as it submorged several villeges?—It would have a canal of six or seven miles, which would do a great deal of good. Mr. Gihh, my predecessor, thought that any submerging that might result will be someterbalanced by the amount of good that is likely to nearne. The villages are very small indeed.
- 26. Q. Are there any other works?—No, I would only recommend these three, as useful for fature famines.
- 27. Q. Are they situated in black cotton sail areas

  -Kardikop is mostly in black estten soil; and Pudkalkatti
  is in half-and-half; bat I have not seen it.

- 28. Q. (The President.) We have had a good deal of discouragement in Bijapar, where these tanks are; but the people persistently refuse to use them; so that one is a little unxions about making tanks in hlask sotton soil?—Yes, but I would point to the Gokuk could of which the water is need. However, in the best hlask cotton soil, with the least rain, the people get a good crop, so that there might be no demand for irrigation is good years.
- 29. Q. With regard to the small tanks under the Rsvanue Anthorities, do they apply to the Executive Eugineer, to repair them, or do the owners apply straight to the Public Works Department?—The owners apply in the first instance to the Collector to take their 10 per contractivity. oest. cantrioution.
- 30. Q. Ie ue information given to the Executive Engineer till the money, is collected P—They will probably tell the Executive Eugineer at the same time.
- 31. Q. Does, the Executive Engineer not receive the upplication in the first instance?—No, the Collector receives the application and seads it to the Excentive Engineer to make the estimate.
- 32. Q. An argument has been need in favour of the 10 per cent, contributis athat it best indicates the comparative argency of the different works. Suppose you had no coalibation at all, how would you decide the order in which to execute the works?—The argency of the repeirs could easily be settled between the Executive Engineer of the Irrigation Danartment and the Collector. the Irrigation Dapartment and the Collector.
- 33. Q. 1 suppose there will have to be a complete curvey and systematic record kept of the canditians of the various tanks?—Yes, the Excentive Engineer knows prelty well in what conditions the tanks are; and so does the Callector and Assistant Collector.
  - 84. Q. There are 200 tanks in this district ?-Yes,
- 85. Q. If you receive applications for the whole 200, it would be difficult to determine which should be dealt with first?-No; I do not think so.
- S6 Q. Of the various schemes proposed for the district, which would you prefer to see push forward first?—The Padkalkatti tank.
- 37. Q. On any of these worke could famine labour be omployed?—Yos, famine labour could be employed on the Pudkalkatti taak.
- 38. Q. Have you a number of tanke entered in your Famiae Reliof programme?—There are very few tanks entered on the famine programms. They are of very little use as femiae relief works in this district.
- 39. Q. Would the people go some distance to work on a tank ?~Yes.
- 40. Q. How far would they go?—Fifteen miles is about the limit, but it takes a very had famine to make them go fifteen milcs.
- 41. Q. And apparently nothing can be done for this most exposed part of this district P—I de not know what is possible to do for the black estlen soil area in the way of irrigation, except the Pulkaikatti tank, unless there is some prospect of damming the Malprahha river-
- 42. Q. Whatever is done, the water will only he required in famine years?—Yes, only when the min fails.
- 43. Q. In famino year, they would not take waler for cotton?—The crop semetimes falls in a famine year; but I have never heard of cotton being irrigated.
- 44. Q. If they had tanks, would they grow juari?— They might grow juari or wheat.
- 45. Q. Would they grow rice?-No, that would linvolve too great an expenditure.
- 46. Q. (Mr. Ibbelsan.) Too great an initial expenditures Hawlong have you hese in Dharwar ?—Six weeks this time, but I was here for a year cleven years ago.
- 47. Q. Where were you hefore you came here?—In Belgaum and the Kauara district.
- 48. Q. You say many of the small tanks are out of spair. What is the matter with them?—They are eilted
- 49. Q. Apart from that?-So far as I know that is all.
- 50. Q. Would you propose to clear them out?—That is usually unsuccessful.
- -51. Q. And what would you do lo them?—I do not quite know how the repairs should be done
  52. Q. You think, if they were handed over to the people, they would not repair them?—No, the people certainly would not do the repairs.

- 63. Q. Mr. Shirbatti told us of certain channels which the speeple repair themselves at a cest of about its. 100 f—Yes, but that is an exception.
- :54. Q. Supposing we legislate, and make the people responsible, sould not a good Manulathar make them combine and keep the tank in repair if he had the necessary power at his back?—No; in this district the people are so unsophisticated as to be is capable of combining.
- 55. Q. If the repairs were necessary the Mamlatdar could use the legislative power ?—I don't think the necessary presente could be applied; and the Mumlatdar has not enough technical knowledge to know what repairs are required when a tank is out of repair.
- 56. Q. Have you had any experience of paying takavin ordinary years? Yes.
- 57. Q. What you have told us, then, is not based merely upon famine experience. You say that there have been many years of famine in this district. Mr. Shirbatti told us only a few?—There was not famine in 1899. We have had scarcities requiring relief, but no regular famine since 1876.
- 66. Q. (Mr. Rajaratna Mudaliyar.)—You say that there is no difficulty in recovering the takavi loan P—I have nover known a case in which the loan has not been paid
- 50. Q. In most cases, were not the lease very small?—No, they range from Rs. 200 to Rs. 2,000. The average is about 800 or 400 rapides.
- 60. Q. What kind of works you lend the money for ?-
- 61. Q. Woold these works cost large sams?—Not very, but weeding takes a lot of time: they spend some of the money and keep a little. We caunot prevent a little misappropriation. They don't take more than a small percentage.
- 62. Q. Would not inspection by the Revenue Officers prevent this misappropriation?—Yes, but we have not the establishment.
- 63. Q. What staff is required for an efficient inspection P-We should have additional Mambatdars.
- 64. Q. What amount was advanced in the district of Belgaum in the famine year for wells and other improvements of land?—Speaking from memory, about 1½ lakhs. (The President quoted proper figure, viz., 2,16,056.)
- 65. Q. Were any steps taken to shook the work under these advances?—The Revenue Officers inspected the work sometimes before, but generally afternards. The Assistant Collectors inspected a lorge number of works. The inspection of the fakari works is a very important part of his lievance work, if he can only get the time to do it.
  - 66. Q. Is he required to submit a report ?- Yes.
- 67. Q. As regards the Golah canal, the Deputy Collector told us that, if the extension could be carried out, a very much larger area could be irrigated?—I cannot tell you mything about that, as it is six years since I was at Belganm.
- 68. Q. (Mr. Muir-Mackenzie.) You said the people who horrowed money for hand improvement were content to pay it back within the reasonable period of ten years. Don't you think it would be advisable to extend the period so as to attract the people of a less provident class F—I don't think there is any need to do so. It might make the result feed that the advance used not be returned. the people feel that the edvance need not be returned.
- 69. Q. You would not approve, even if an experiment is made in that direction ?— No, all that is wanted is promptness in dealing with applications for advances and thorough, but not too severe, inspection of the work done.
- 70. Q. There has been a good deal of ovidence that the people are reluctant to borrow, owing to the rigidity with which the instalments are recovered. You do not agree with thet ?-No; I have never come across that. Hardly may one

- asks for a pestponement beyond the ten years. If he asks, Mr. Boyd. he gets it. The advances are given for weeding and ombankments, and semotimes for conversion of dry into rice lands. The profits on those come soon, and they come refund early. If you give takavi for a well, the period might be extended to fifteen or twenty years.
- 71. Q. You would not even recover interest until the well has been in use for some time?—No.
- 72. Q. I thought you meant a pumper raynt would come on to relief work, for instance?—I do not call a man who has land a pauper. Oely coolies come on to relief work. It would take two years of famine to bring a raynt landowner on to relief works in this district.
- 73. Q. Can famine labour be employed on talk or small embankments ?-No, the people could do it for half the cost themselves.
- 74 Q. Then it would not be possible for Government to use famine inbour on these works ?—It would be difficult to decide whese embankment should be made. The works would be so scattered that supervision would be quite impracticable.
- 75. Q. You need not make them on a large scale ?-The
- 76. Q. (Mr. Ibbetson.) Why not estimate the amount of work that has to be done, and make over gangs of famine labourers to the people to work on the land, telling them to employ them for a definite number of days, and got what work they have done?—The people could not get good work out of fumine labourers, who do as little as they can.
- (Mr. Mnir-Mackenzie to Mr. Ibbetson.) You have a head man in the Punjab villages, who could make the people work: we have not?—(Mr. Ibbetson.) That is the crex of the whole thing.
- 77. Q. As regards the inspection of takeri work, I suppose something more might be done to do the Assistant Collectors inspect the boundary marks?—To incilitate the taker inspection work, the boundary mark inspection might be relaxed, as the marks are in an excellent condition.
- 78. Q. About the repairs of small tanks, you seem to have read the orders of Government in mean that the tank is not to be repaired, unless the contribution of 10 per cent. is paid?—I understand that 10 per cent. contribution can sometimes be foregone, but seldom is.
- 79. Q. (The President.) Is there may other point you would like to call our attention to ?-No.
- 80. Q. (Mr. Muir-Mackenzie.) Do any people pay for water which they do not receive?—Yes.
  - 81. Q. Would you say 10 per cent. ?- About 5 per cent.
- 82. Q. Do you menn 5 per cent. of the tunks or 5 per cent. of the nrea?—Five per cent. of the area.
- 83. Q. Do you menn in ordinary years, or in years of short rainfall?—Often in ordinary years if the tucks are in n bad state of repnir.
- 84. Q. Do you think that Government ought to ubandon some of the tanks, or put all under repairs f-I think they ought to ubandon the one-man tank, and repair all the others.
- others.

  BB. Q. There was a rule in 1865 that, without the sanction of Government, repairs should not be undertaken if they coat more than 10 years' water-revenue. Do you think that rule should be relaised?—No, I think not; I thick the rule might be relaxed in the case of certain good tanks. There are several fine big tanks in this district which badly need repairs. One of them, that at Hirekeur, irrigates ever 500 neres. The repairs to it would be costly; but it is well worth keeping up, and at present sonny, of the people pay consolidated rates and get no water; and they have suffered in this way for a long time. I may add that it is hepeless to expect to run tank irrigation in these parts profitably to Government. in these parts profitably to Government.
- WITNESS No. 85 .- Mr. II. B. Shoubeldor, Acting Executive Engineer, Dharwor Irrigation.
- 1. Q. (The President.) You have only just come to Dharwur!-Yes; I have only been here 4 or 5 months.
  - 2. Q. Where were you before that f-In Sind.
- 3. Q. So that you have had very little time to ascertain the requirements of the district ?-1 have seen a good many tanks during the last few months.
- 4. Q. Have you any suggestions to make in regard to irrigation works?—I think that tank repairs should be
- carried out by Government, as the people cannot do it themselves. They do not carry out oven the most petty ropairs that are roquired.
- 5. Q. Putting all the tanks into repair would involve a great expenditure?—Yes, and a good deal of plan work would have to be done.
- 6. Q. In many cases would it not be merely a matter of rai-ing the hunds so many feet ?—Yes, but in many of

Shoubriage.

13 Jan. 02.

these tanks there are no pakka outlets and no waste Shoubridge. weirs.

- 7. Q. No wasto woirs at all P-In most cases the 13 Jan. 02. waste woirs are merely oots, some have no waste weirs at all.
  - 8. Q. Could you give us an estimate of what would be the cost of repairing the tanks in the Dinewar district? -I could not say.
  - 9. Q. (Mr. Muir-Mackeuzie.) Twolvo or thirteen ikhe was, I think, the amount of the estimate which came hefore the Government.
  - (Mr. Higham.) I believe the figure is 131 lakhs.
  - 10. Q. After the repairs are finished, there will niways be current repairs?—Yes, which the Department will have to do. The owners live away from their fields which they let to tenants, and as long as these latter get water, they do not care what the state of the tank is.
  - 11. Q. Yau think the work of repairs ought to be taken in hand?—Yes.
  - 12. Q. How much can be done per annun ?-I think more might be done if our methods were a little less
    - 13. Q. Are you employed on irrigation alone P-Yes.
  - 14. Q. Do your irrigation haundaries go beyond this district?—They go into Kanara.
    - 15. Q. Not Belgaum and Bijapur P-No.
  - 16. Q. Do you know of any large project worth ecosidering in this district? Any project for ghat otorage from which an unfailing sopply could be got?—There is only the Madag tank; the Dharma Caual is not in the
  - 17. Q. The Madag Tank is on the borders of Mysore?— Yea; I have not seen it, but it strikes me as a good project.
  - 18. Q. Would the Asondi tonk be filled by the Madag? I do not know
  - Beale explained that it woold not, as the Asundi Mr. is up stream.
  - 19. Q. Is there any other project which occurs to you which you would like to suggest ?—No.
  - which you would like to suggest ?—No.

    20. Q. What about the order in which you take up the repairs of tanks ?—The petition is sent to me, and not to the Collector. I cend it to the Suh-Divisional Officer for report, and he tells me roughly what the repairs will ent. Estimates are prepared in the order of receipt of application. I do not wont to have applications which idvolve the scattering of establishments all over the place. I cannot sanction the expenditure, the estimates go to the Superintending Engineer, and the allotment is only made after approval by the Collector. I want to do away with the areas and take up one block or catchinent at a time. I would call for applications giving notice that in a certain area the tanks will be repaired.

    21. Q. (Mr. Muir-Mackenzie) You wish to repair
  - 21. Q. (Mr. Muir-Mackenzie) You wish to repair the tanks by catchments When the order for the removal of the 10 per cent. contribution is recoised, you can arrange matters as you like?—Then the question of estimates will come in under the present rules; the estimates have to be prepared very exactly; and if there is an excess of more than 6 per cent., a revised estimate has to be outmitted. This necessitates very close survoying and a good deal of wasto of time. I think we should be given a free hand.
  - 22. Q. (Mr. Higham.) But when the estimate is exceeded, revised estimates need not always he necessary: any excess can be passed on completion of the work?—It is best to get it passed beforehand, so as to save a long list of explanations
  - 23. Q. How much can you sanction for repairs your-lf P. I can only sanction repairs up to its. 200. Very little can he done for Its. 200.
  - 24. Q. How do you work out the limit of ten years revenue? Soppose the estimate of the work came to about ten years revenue, how many years after that can you go on speuding money on the same tank?—The previous estimate of the tank has to be reported.
  - 25. Q. But, if you have to make repairs within four or five years of the pievious repairs, does not the limit come in ?—The Superintending Engineer decides whether the matter should be sent up to Government.
  - 26. Q. Cau you say what your present annual exponditure is on second class tanks?—Our present expenditure is Rs. 40,000 per year on all tanks. Previous to 1891 and 1892, we only spent money on tanks irrigating fifty neres

- or more. Since thea we have repaired all classes of tanks except "one-man" tanks.
- 27. Q. Did you prepare the estimate of Re. 133 lakbs or the repairs of tanks in this district?—No, the estifor the repairs of tanks in this district ?—No, the esti-mates, I believe, were propared for the Tank Commission.
- 28. Q. I suppose the estimate of 13½ lakes is required for improving and restoring the tanks quite independent of what you are now spending every year?—I would rather think it includes it.
- 29. Q. What is the total revenue from all tanks F—I cannot tell you for the tanks irrigating under fifty acres. There are 473 second class irrigation works, the revenue of which is Rs. 1,75,000.
  - 30. Q. These Irrigate over fifty acres !-- Yce.
- S1. Q. And the revenue from each is about Rs. 400. Then there are about one thousand tanks, about which you know nothing. Supposing the average income of these to be about Rs. 200 each, the total revenue will amount to three or four lakes of rupees, and the proposal is to spend only four years' revonce in restoring them?—Yes, but you must always allow for petty repairs.
- 32 Q. That is a long way below the ten years' limit?—The ten years' limit does not apply so much for the big tanks; smaller tanks are the most difficult to repair nuder the ten years' limit.
- 38. Q. Are you engaged in working out any projects now? Yes, several for the repairs of small tanks.
- 34 Q. Havo you any other works under your charge, besides tanks?—liesides small tanks, I have the Dharma Canal, which feeds several tanks.
- 35. Q. Are you working up any proposals for new irrigation works?—No, I have not investigated the projects mentioned in Mr. Beale's report.
- 36. Q. (Mr. Ibbetson.) Speaking about the repairs 36. 4. (Alt. Lobetson.) Speaking about the repairs of there tanks, you say a certain amount of surroying is necessary. We were told the other day that a school box could do all the surroying necessary on a sheet of notepaper; probably that was intended to be an exaggeration; but is it anywhere near correctness?—For tank repairs, a sorveyor leveller is required on Rs. 40 to Rs. 80 per month. mont b.
- 37. Q He could not work out the project?--Yes; the project might be worked out by him.
- 38. Q. He could not settle the question of the waste welr? No; the Executive Engineer would have to see to the waste well and outlets.
- 39. Q. (Mr. Muir-Mackenzie.) Does the addition of a waste weir considerably improve the capacity of a tack?—The capacity is haproved a little if the waste-welr is raised. The work is done chiefly to prevent the tank from breaching.
- 40. Q. It does help it to irrigate more land?-No; not unless we mise the water-supply level.
- 41. Q You don't try to raise the area irrigated Pare not supposed to increase the area of irrigation without the sauctura of Government.
- 43. Q. Did you find many of the tanks breached f-No; not many ure breached. I found une breached which the Poblic Works Department had monded three years ago. The breach was not reported, and the tank had never held water sluce.
- 43. Q. Why was the matter not reported to the Collector?—I asked the Patel why be had not done so; and be said that it was because he was a now man. I ordered the repairs to be done at coce, but I have to send in an estimate for it, though it would cost less than Rs. 100.
- 41. Q Would it be worth repairing all the tanks ?—
  No; some do not fill, and it would not be possible to raise
  the supply level.
  45. Q. The principal fault of these tanks is, I understand, that they silt up.—I don't think so. It is bad in
  the upper catchments, much less further down. A small
  raising of the supply level remedies that.
- 40. Q. Does it not submerge land which the people do not like to see submerged?—The extra flooding is not very important.
- 47. Q. Could the inercase of allt be prevented by annual operations by the people?—The ailt cannot profitably be cleared. It is much better to raise the supply
- 48 Q. Is there any scope for new small tanks !- No, not in the areas I have visited.

WITNESS No. 86 .- MR. W. L. CAMERON, Superintending Engineer, Southern Dirision.

Answers to pritned questions.

1. The districts to which the following answers refer sre those of the Scathern Division, above Ghots, viz., Satara, Belgaum, Dharwar, and Bijapur.

I, now have administrative charge of the Public Worka, in the Southern Dirision.

- 2. A statement—Appendix A—is attached showing the minfall at the head-quarter stations of the above districts—for each month during the last ten years.
  - 3. There is no obstacle to the extension of irrigation arising from-
    - (1) Sparsity of population;
    - (2) Insufficient supply of catalo;
    - (7) . Fear of onhanced rent of rerenne assessment;
    - (S) Uncertainty of tenure or defects of the tenancy law;

unr is (3) want of manure a bor to a moderate extension of irrigation. The quantity of manure is, however, in most parts limited, and an rapid increase is possible in the more highly irrigated crops such as sagarcane.

- (4) There are large tracts of black soil which cannot be irrigated, but there are large areas of snitable land under commond of irrigation works which are capable of being, but are not ordinarily, irrigated.
- (5) In years of scarcity on, I think, every work, scores of applications for water have to be refused owing to the probable insufficiency of supply, and water has to be given in rototion to those who have obtained permission to irrigote. Even undersuch of remissiones, however, people bog for water and offer to necept all risks themselves and to ask for no remissions in case of failure of crops. Such applications are, of course, disregarded, but they tend to show that people are willing to take any reasonable risk, and the thought that, in an ordinary year, the supply may be uncertain, does not deter them from asking for water.
- (6) Lack of capital, as far as I have been able to ascertain, is no chatacle to the extension of irrigation, except in the case of a crop such as sugaroane, which requires a heavy outloy in the purchase of minare.
- (9) As a rule, the people are coatent with the eraps grown naturally, and if the rains are good, the difference in raine between irrigated erops and those of the same kind grown in the rainfall does not appear to be safficiently great to cover the coat of the water supplied and other expeases incidental on irrigation.
- 6. The irrigated area is so small compared with the total area under cultivation that it in no way affects the agricultural labour market.
- 8. On the Gokak Canal in the Belgaum district, which passes through a somewhat dry tract of country, the cultivators are keenly alive to the advantages of irrigation, and all the water that can be spared for irrigation is utilized. Any extension of the system would be welcomed by the people. The total culturable area under command of the present length of canal is 17,027 acres, and as much as 10,508 acres or 60 per cent. of the whole was irrigated in 10,001-1001.

On what are known as Second Class Irrigation Works that is to say, those which are maintained and managed by the cultivators (in the Southern Division chiefly small tanks which contain a sufficient supply to keep the rice corps depending on there alire during breaks in the measurem, the rights to water are jealously gnarded. On these works a consolidated rate is charged, and the people are required to pay the assessment, whether they irrigate or not.

- 9. (1) and (2) In the Southern Division there are, as far as I know, no private canals as are to be found in Sind.
- (3) A statement (Appendix B) is attached giving the crop rates on the ranals in the Southern Division. The rate is charged on the actual area irrigated, which is measured up before the end of the season.

11. In the Decean and Sonthern Mahratta Country I have never heard of damage of any kind resulting from irrigation.

Mr. Cameron.

18 Jan. 02.

- 12. (1) A statement (Appendix C) is appended showing the sources from which the canals in the Scuthern Division derire their supply.
- (2) Water is taken from the main or branch canal by means of oatlets which are often simple iron pipes fitted with wooden plugs.
- 15. The canal irrigation is not ordinarily supplemented by irrigation from wells, but wells are often found along the irrigated iract, and in years of searoity they are used to supplement canal water. In fact, when the area for which water applications are received exceeds that for which the supply suffices, preference would be given to those applicants who have wells in their land and whose crops, therefore, are practically certain not to fail.
- 17. (3) The water-rates peid on the canals in the Southern Dirision for various kinds of crops are shown in Appendix B. Payment is made on the octual area irricated.
  - (4) No payment is made in the form of royalty.
- 19. I have never seen or heard of any damage resolting from irrigatina in the Decean. The nature of the country is such that the water drains away without difficulty.
- 20. Provision is made for myintonance in estimates sauctioned annually. The average cost per aero irrigoted daring the year 1900-1901 is given in Appendix D.
- 22 I do not think cannis could be constructed by private persons in this part of the country. The original cost would be far too heavy and the profits far too small.
- 23. (1) All tanks are supplied with water brought down during the monsoon by the nales across which dams are thrown.
- (2) In most cases water is passed through an outlet into a canal which traverses the country and from which it is let out on to the irrigated louds through small outlets which are generally pipes fitted with wooden plugs. In the case of the Yerla river irrigation systom, water is let through outlets into the nah and picked up lower down by means of a masoury weir and theace along canal to the irrigated lands.
- (4) The area irrigated in 1900-1901 from the various tanks is shown in Appendix D.
- 26. Irrigation is not ordinorily supplemented by water from wells.
- 28. (1) and (2) No tanks are owned by prirate persons.
- (3) The water-rates which are paid on the area actually irrigated are shown in Appendix B.
- 30. On Government tanks provision is made for maintenance in outlimates sanctioned annually. The incidence of the cost of maintenance per sore irrigated in 1900-1901 is shown in Appendix D.
- 31. No tanks belong to prirate individuals. The second closs irrigation tanks are managed and unintained by the cultivators. These cultivators pay a consolidated assessment (for water and land combined) direct to Government.
- 82. I do not think private persons are in a position to construct irrigation tanks. It is doubtful if the realizations would pay such interest on the sum required for land compensation alone as private capitalists would look for.
- 33. The time has not yet come when the silting of tanks has caused much inconvenience. In the case of the Maini Tank, however, the bed has silted up to 14 feet above the outlet, the total accumulation of silt being estimated to he 29,824,660 cubic feet. It has already been faund nocessary to raise the dam and waste weir to compensate for the diminution of storage capacity. This tank was constructed as lately as 1873.

- 1. Q. (The President.) How long have you been Superintonding Engineer of the Southern Division?—For the last ten months.
- 2. Q. Where were you before that?—I was Executive Engineer, Nasik. I was re-called from leave for famine work. I was also for a short time in Kathiawar, and before that Executive Engineer of Dharwar in charge of rosds and buildings.
- 3. Q. You have had a good deal of experience of the Deccau altogether ? Yes, a fair experience.
- 4. Q. You ery, "As a rale, the people are content with the crops grown naturally; and if rains are good, the difference in velue between irrigated crops and those of the same kind grown on the rainfall does not appear to be sufficiently great to cover the cost of the water supplied and other expenses incidental on irrigation." Would it be worth lowering the irrigation rates: would it make any difference?—No; I do not think so.
- 5. Q. You say, "The canal irrigation is not ordinarily sapplemented by irrigation from wells, but wells are often found along the irrigated tract; and in years of scarcity they are need to supplement canal water?"—I was referring to Nasik.
- 6. Q. Where there are several wells, and an application is made for water, would you give preference to the man owning these wells or would you give it to the man who has no wells?—I would ordinarily give preference to men owning wells.
- 7. Q. On the Nira Canal, where a certain amount of water has to be conserved, the Irrigation Department supplies water up to a certain date; and the cultivators have to use their wells after that?—The system of stopping of water, at a certain date, and making people use wells after that, may be feasible in Poona and Khandesh, but not lore.
- 8. Q. Do you think that in some places such a process would kill came cultivation altogether?—No, I don't think it would; the people don't mind accepting a certain of risk.
- 9. Q. In Appendix D of your printed memorandnm there are some startling differences between cases of canol and tank irrigation. The highest average cost per acro irrigated under casals is for Chikali Canal Rs. 343; and the highest for tank is on the upper Man River works, where the average cost per acre irrigated is Rs. 2161?—On the Man River works heavy expenditure was incurred in constructing a berm, by famine labour, to the Pingli tank dam. On the Yerla River works, a large outlay was incurred in etrongthening, also by famine labour, the Nehr tank dam.

APPENDIX D.

Total Area irrigated and average cost per acre irrigated during 1900-1901.

Name of Work.	Area irrigated during the year.	Per acro irrigated.	Remarks.
Canals.	Acres.	Rs.	,
Krishaa Cannl	8,288 -717 537 10,508	1.59 3.21 . 3.43 0.80

Dambal Tank	144° 106 827	2·18 6·15 1·66	Area oa which
Asundi Mavinkop	168 185° 540°	19·48 9 12 0·38	assessment ie tevled.

- 10. Q. I sappose the large cost per sere on the Asundi tank was due to the same cases?—Yes; to unusually heavy expenditure.
- heavy expenditure.

  11. Q. We have had very little information yet about the Satarn district. Mr. Beale in his report quotes the views of Mr. Atkins, Collector of Satara, who ears: "the Man talnka is most in need of protective irrigation, hut new schemes would interfere with the water-supply to the Mhasvad tank, which irrigates lands in Sholapur." Are there in Satara many likely places for Ghat storage?—Yes; I think there are places where very fine storage tanks might be made on the Koyna River, but no definite information is available.
- 12 Q. (Mr. Muir-Mackensie.) Would that be a part of the Krishna Canal scheme?—The Krishna Canal weir is some little distance obove the juaction of the Krishna and Koyna Rivers. I would like to see first of all whether we can bring the water above the weir from the Koyna River at a moderate cost.
- 13. Q. Is the Krishna Canal capable of extension?—Yes, the original project was for 35 miles; we can extend it by ten miles, which will bring 10,000 more acres under command.
- 14. Q. You are not certain about the levels of this Koyna soheme?—Tho last thing dono was that levels were ordered to be taken, but they have not been sent in yet.
- 15. Q. Where was the hund to be?—That was not settled, but somewhere near Halwak there would be a good eito. Tho sites further east might have better eatchments; but a large amount of land would be submerged, and as you go lower down, the land gete more valuable.
- 16 Q. What force is there in Mr. Atkine' remarks that the now schemes would interfere with the Mhaswad tank?— The Jeshi tank would cut off 140 square miles from the catchmeat area of the Mhasvad tank.
- 17. Q. This is one of the proposed tanks which would deprive the Mhasvad tank of its water-supply. It forms an important part of the Mhasvad basin?—Yos.
- 18. Q, Probably it might be a good plan to store water for the sake of the Mhasvad tank if it was certain to be utilized ?—The Mhasvad water may possibly be fully used later on. I cannot say how often the tank would have overflowed, as the dam began slipping, and the waste weir was eat down. The weir so ont down has overflowed several times. If it had not been cut down, I am not prepared to eay if water would have gone over.
  - 19. Q. Was the dam shaky?-It began to elip.
  - 20. Q. I suppose it has been all right since?-Yes.

- 21. Q. Is the tank in Sholapur or Satarn?—The bund and tank are in the Satora district.
- 22. Q. (The President)—The Kriehaa River is, I undertand, so mach below the level of the country that it is difficult to utilize it?—As you go down east, the fall of the Krishna River becomes smaller and empler. Above Karad the fall is, I think, only 2½ feet per mile, opposite Satara 4½ feet, but in Bijapur it is 6 to 12 inches per mile. There is not much to be expected from it. The banks are 20 to 40 feet high.
- 23. Q. Would you encourage bandharas on the Krishnof Is there any flat ground neor the river, or in the valley itself?—Bandharas on the Krishna might be made in the Satura district or just outside the limits of it. A large body of woter could be let out, but it would have to be a grant weir, 500 or 600 feet long.
  - 24: Q. What would be the height ?- 20 to 30 feet.
- 15. Q. That would make o fair size tank la the bed of the river?—Yos.
- 26. Q. Turning to Bijapur, that unbappy place, which callers a great deal from famine, what can be done for it in the way of irrigation?—One good thing would be the extension of the Gokak Canal. Personally I am interested in seeing that scheme carried out. It has a better chance in my opinion than any other canal in this part of the country. It travels along the left bank of the Ghatprabha country. It tinvels along the left bank of the Ghatprabha River, and a very large area will be brought under its command.
- 27. Q. What is the soil?—I have not seen the soil; hut it is soid to be black but not very heavy.
- 38. Q. Do you say, with certainty, that the people would take water?—I should say so. It is m arid tract; and I quite bolievo, with the experience of recent drought that the people would gladly toke the woter.
- 20. Q. Why is not more water taken on the Krishna?—On the Krishna Canal all the woter is atilized in irrigation and the only bar to the extension of Irrigation is the want of water in the river. If the supply were sufficient, 25 per cent. of the area under command would probably be irrigated
- 30. Q. Whot is it that limits the demond on the Krishna Canalt I sit want of water or want of intelligence on the part of the people?—In the ordinary years there is an water; last year we had had an appreciable increase, the figures jumping from 4,000 to 8,288 acres.
- 31. Q. You say the Koyna Canel from the Krishna might be too low: in that case what would you do with the water?—We could pick up water from the Koyna storage lower dawn on the Krishna, opposite Tasgaon, for exemple.
- 32. Q. I think Mr. FizeGibbons said that the Gokak Canal will carry 408 feet per second?—The raising of the weir of the Gokak Conal by shutters will only provide enough water for the mills.
- 33. Q. Is 458 feet per second the maximum available from the catchment?—No. This is the quantity that could probably be rafely stored. If the canal were increased in size, more water could be let out in the mensoon without increasing the storage.
- 34. Q. Do you think it is worth il, why stop at 458 feet per second, when you can get 900?—That would involve a very heavy expenditure.
- 35. Q. The extension of the Gokok Canal is estimated at 91 lokhs of rupoes ?—That is an enormous sum to be spent in one particular part of the country.
- 36. Q. We have had evidence that in Bijnpur people are not keen on water. Mr. Beale mokes some remarks on the Muchkundi tauk on page 801 of his reports; coming to Muchkundi tauk on page 301 of his reports; colang to this district, is there any chance of the Magad tonk extension being carried out. Have you gone into the question at oil?—The dom of the Magad tank is enormous; the pitching is of 3 feet oube blocks; and everything is on a gigantic scale. The original idea was that the water level would have been 100 feet higher than it is at present.
- 87. Q. What is the land under it like ?—It is cultivated land, ond the Mysore Government may refuse to part with the land that would be submerged if the waste weir were
- 38. Q. It streek me from Mr. Bealo's map that the canal winds obant; but never gets into the famine district?—Not much of the district is affected by famine, only 10 per cent. of the villagers came to relief works.

- 39. Q. If it amounts to a question of locking up water in a country which does not want it, wo ought to store it in the Madag, and let it feed the Tungabhadra Rivor, and become a Madras schems?—One of the projects proposed for the Tungabhadra is for a canal from Heerur to Bellory? A suitable site for a wair could ricabably he found near A suitable A suitable site for a weir could probably be found near Hearur but the canal from it would not benefit hinds in the Bombay Presidency.
- 40. Q. Are there any profitable Ghot projects?—No, I know of none in Dharwar. There is a place suitable for a tank at Meundi near the Dambal tank, where Mr. Shirbatti says the people are very anxious for irrigation.
- 41. Q. In parsgraph 33 of year memorandum you say:—"The time has not yet come when the silting of tanks has caused much inconveniouse. In the case of the tanks has caused mach inconvenience. In the case of the Maini tank, however, the bed has eilted up to 14 feet above the earlet, the total secumulation of sult being estimated to be 20,824,560 cubic feet. It has already been found necessary to raise the dam and waste weir to compensate for the diminution of eterage capacity. This tank was constructed as Intely as 1870." Is there some inherent difficulty about that tank ?—There is all black soil in the catchment and I have noticed that small village tonks in black soil get silted un muldly. black soil get silted up rapidly.
- 42. Q. Why does the black soil silt up more easily than any other?—In oultivated black soil the fields are bare of jungle and grass and silt is, therefore, more easily produced, when there is a wash down.
  - 43. Q. It is moved more easily ?- Yes.
- 41. Q As a matter of fact, is a black soil streem or fleed more muddy then other streams?—It looks extremely
- 45 Q Would you advocate the making of sluices as a precaation against silting ?—For big works like the Gokak Storage Works, I should strongly recommend large sluices.
- 46 Q. I suppose you do not believe that clearing silt from tanks out be carried out economically ?- No clearence of silt by lobour ena be economical.
- 47. Q. (Mr. Higham.)—With regard to the Satara district what proposals are there for increasing the storage of the Krishne?—There was a proposal for a tank at Ambayadi.
- Ambavadi.

  49. Q That has been abandened f—Yes. Then there was the Tarla scheme. General Goodfellow reported in 1869 ogainst the scheme which Colonel Le Mesurier had recommended in 1885. Colonel Le Mesurier, while drawing attention to the risks attending the construction of lofty oathen dams, reported in favour of the scheme which according to his figures would yield a revenae of 8½ per cent. an the direct outlay. In 1888 General Goodfellow reported strongly against the scheme, drawing attention to the remarks by Colonel Lo Mesurier that there was a great risk attending any dam over 50 to 60 feet high. The dom was to be an earthen one 95 feet high. He pointed out that the only fessible dam would be a masonry one and gave certain figures which showed that the profits under those circumstances would be very small. He also drew attention to the feet that the distance fram Tarla to the Khodshi weir would be 20 miles, so that there would he heavy loss from evaporation and absorption.
- 49. Q The estimate of the total less was 420 million cubic feet !--Yes.
- 50. Q. The Krishno Canal weir is in the bed of the river, is it not  $P\!-\!Y\!es$  ,
- 61. Q What happened after that, was the work commoned?—No work was done. In 1895 Mr. Stronge reported that it would be better to give up the Tarlu scheme and build a series of weirs above Khodehi in the chape of bridges with openings of 30 or 40 feet spau with baulks or gates in the openings through which water could be gradually let down the Kriehna. One site is ot Mabuli, nuether of Gajegaon, and another at Bharampuri. The weirs were to be built at the rapids so as to make use of the fall which is about 10 feet.
- 52. Q. Could you get the water away from there ?-Bharampuri there is room for a small canal on the right
- 53. Q. The iden is to have a series of weils each storing a small quentity of water ?-Yes.
- 54. Q. What would be the aggregate storage ?-It has not been onloulated.
- 55. Q. Where would the water be utilized?-In the Krishna Canal.

Mr. Cameron 18 Jnn. 02.

Mr. Cameron 13 Jan. 02.

- 50. Q. How much would this storage increase the Krishna Canal supply?—The quantity has not heen calculated. It will not exceed one thousand million enbic feet.
  - 57. Q. Is that all you-want?-Yes, that would be ample.
- 58. Q. What cauld you do with that ?—We could extend to present canal by tea miles. With plenty of storage, we the present canal by ten miles. We could have n long left bank canal.
- 59. Q. Is that the only proposal put forward so far ?
- 60. Q. Is there any chance of a canal, taking off the Krishna, going out to the Athai talnka?—It would have to he very long; and we might not get enough of water for it 61. Q. Has it ever been surreyed?—No, it would have to he a very long canal and very expensive owing, to the large inasonry works that would be necessary, as it would have to he carried right across the tributaries of the Krisban.
- 62. Q. And you would aslo require heavy storage works to get the water, the anly storage project so far being that proposed by Mr. Strange?—There is one for the Koyna. The Kayna is a large river with a catchment in the Ghats. It would be practically certain to fill.
- 63. Q. Have they ony plans of that?—The Executive Eaglacer reported that levels were being taken, but femine came upon us and no progress was made.
- 64 Q. Are, there any sites?—I am certain that sites can be found on the Koyna.
- 65. Q. Has the Tarla scheme been shelved !- Yes, it has practically been ahandoned.
- 66. Q. Is there any other project you would like to recommend being completed for the Satora district apart from those !-No.
- 67. Q. Can any of these works he begun as famine works?—The works an the Krishna world he masonry which is unsuited for famine labour. Part of the dam for a storage tank on the Koyna might be of earth on which famine labour could be employed.
- 68. Q. How far has the Goragnoa tank progressed?— The puddle trench has been excavated, and the subsoil known locally as "Shadu" (a material which chemical analyzer has shown to contain 4 per cent. of salt) has been removed and the excavation partly filled in.
- 69. Q Only a small sum has been spent, compared to the cost. The total expenditure of the September last was Rs. 1,85,000?—That is famine expenditure; the normal expenditure would be Rs. 1,50,000.
- 70. Q. In regard to Sangegl and Hullur, what is proposed?—Large storage tanks are to be formed from which water is to be let out for irrigation. With the experience of Bijapur, I do not recommend the Sangegi tank. The people do not appear to be desirous of irrigatio, and 6,000 acres would be and the sangegi tank to the olinose of supplying water to another area. It is a serious thing to permanently throw out of cultivation a large area of land when there is no waste land to give out in exchange. in exchange.
- 71. Q. The Collector of Bijapur has recommended that the work should be campleted ?—I believe the Collector has said that the soil on the two sides of the Krishna is very different and that, while on one side the people will not take water, on the other they will.
- 72. Q. Do you think it is doubtful, whether the people will take the water if they could get it P—I think it would be a very doubtful experiment. It would snhmerge 6,000 nersa, and there is no land to give in exchange except in forest lands.
- 73 Q. Similar conditions apply to Hullur!—Yes, but that is a smaller work.
- 74. Q. Have you ever considered the question of irrigating in the Kolhapur State?—No. It will have to be irrigated by the Krishna or one of its tributaries?—Yes, if we carry out the Koyna scheme for storage, and if it be seasible to construct a canal to irrigate laads in the Athui taluka of the Belganm district, the pick-up weir will be in Satara and the water will pass through Kolhapur.
- 75. Q. You were a long time in Sind?—Yos, I was ten years in Sind.
- 76. Q. In Sind the water is given to the cultivators to take us they please?—Yes.
  - 77. Q. There is no application accessary ?-No.
- 78. Q. Do you think that the present roles, in regard to application in this Presidency might be relaxed?—I

- don't see how they can he relaxed. It is different in Sind, where without irrigation there is no crop. Here there is irrigation to a small extent; and at times there is searcity of water, so that it is absolutely necessary for the irrigation officers to know what the demand is going to he. If the people were allowed to take water as they liked from the tank, all the water would be drawn off at once, and all the using, all the water would be drawn off nt oace, and nil the crops would perish for want of water, when required most. I have known during the finmine in Nasik, people come to me and begue to give them water, offering to pay, even, if the crop tailed. Bot, if I had complied with their request, their crops would have failed, and, in addition, the people whose applications had already been accepted would have suffered.
- 79. Q. But that would not apply to the monsoon ?—No, not when the whiter is running to waste; but applications are also necessary to check frauds. The rule is that all applications for measoon crops should be received before the 15th Jaly.
- 60 Q. Might it not be possible that a man might want water after that date, who had no intention of taking it before?—It would lie with the Executive Engineer to charge him double rate, if water were taken without permission, and if he had reason to believe that the man intended to try to avoid payment. The matter is left to the discretion of the Executive Engineer.
- 81. Q. When you make a rule that double rate is to be charged, the Canal Officer is likely to charge i. !—Yes, but the oultivaters are aware of the penalty.
- 82 Q. Is there any objection to in man's taking water in the moneon without application?—No, except for the choice of fraud.
- 83. Q. Would you peaalize them f—As for as I nm concerned, if the man had sent an application, I would not, when there is plenty nf water, penalize him. I would only penalize for attempts to coaceal irrigation.
- 84. Q. But what do your Executive Engineers generally do ?—Some Executive Engineers would penalize thom.
  - 85. Q. I suppose every body knows that rule? -Yes.
- SG. Q. Have you considered the question of irrigation in Knthiawnr ?-No; I was only in Kathiawar for three wecks.
- As regards the question of wells for sugarcane you say the people don't mind accepting a certain amonat of risk. Dayou mean that they don't take the trouble to make wells to cusure a great risk?—I mean oven without a well they grow sugarcane even when there might be some risk of the crops failing.
- 83. Q. Even, if they understood, the water would not be guaranteed?—Yes.
- 89. Q. If we refused to supply water, after a certain date, would not that deter them from growing cane?—On new eanals it might. They would begin caue-growing very slowly at first, and if they found the water falled, they would step planting sugarcane, and other people would be choked off.
- 90 Q. On the Rewari Canal, is the snpply porennial?—I think it generally flows all the year round.
- 91. Q. That is a small caual ?-Yes, it irrigates only
- 92. Q. You say that on second class irrigation works the cultivators jealously guard their rights. Do you think if water from first class works was parcelled out to the villagers as a whole, that they would be equal to controlling the distribution among thomselves?—I he villagers. I fear, could not control the water for first class works. On second class works the question which was in villagers. I fear, could not control the water for urst class works. On second class works the onstom which was in force a hundled years ago is in vogue, but on first class works the people under them would not know what to do
  - 93. Q. I suppose it has never been tried?—No.
- 94. Q. Snpposo you were to give each village water-course a definite supply every teu days and told them to divide it among themselves, would they not be able to do so?—That would mean changing the assessment to consolidated rates.
- 95. Q. Suppose you try it where you have crop rates? Where we have crop rates the areas irrigated are usually small and scattered—mere specks in the midst of unirrgated fields, and I do not think there could be any combination among the irrigators. But on the small second class irrigation tanks the case is different. All the land under them that can be irrigated is assessed at consolidated rates, and the owners are required to pay the assessment whether they

take woter or not, and consequently each man asserts his right to his share of the water.

- 96. Q. I would give the water out in blocks?-In ordinary years the people don't want weter for dry crops and they wen't take it.
- .97. Q. (Mr. Ibbetson.)—You say io parsgraph 3 of your memorandum that there are hirgo troots of black cottonsoil which cannot be irrigated, and that there are tracte that can be irrigated. You don't mean that all cannot be irrigated ?-No, I was thinking of Belgaum and Dhorwar.
- 98. Q. Outside Belgaum and Dharwar do yea know of any soil that caouct be irrigated ?-The anirrigable tracts of black soil ore those to which we cannot give water.
- 99. Q. But would the truets you refer to take water if they could get it?—In the Bijapur district in the part near Bigalkote they would take water I think.
- 100. Q. Are there any other parts in Bliapar where you think water might be token? -I dee't know about the other paris.
- 101.. Q. De you know what conditions determine whother water is taken or not ?—It is perhaps a question of soil.
- 102. Q. Yon say in a famine year the water in all the tanks is less than the domand, but that in ordinary years all the water is not taken owing to the uncertainty of the supply. If the supply were assured, it is said they would take water for high class crops. Do you believe that !—I don't hold those views. The area under high class crops must be limited, and it is only in years of scarcity when the people can see that there is less water in the tank than usual that they cleaner for water. they olamour for water.
- 103. Q. I don't think I have made my point clear. If you could guarantee the supply throughout the season and for every year, near might be induced to go in for high class crops which alone makes irrigation possible in on ordinary year?—I don't think that any doubts about the water-supply prevent people from preparing their lands for high class
- 101. Q. Then you don't think that changing a precarious iato a perconial sepply would lead lo a great increase of irrigation in ordinary years ?-No.
- 105. Q. That irrigation has increased during the last two or three years is natural, but is there any reason to believe that the increase will be maintained in ordinary years?—I think not. For instance, in 1808-09 the irrigalion on the Krishaa tank dropped to the old figures.
- 106. Q. On the Gokak Canal tha people use every drop of waler they can get?—On the Gokak Canal the people have realized the advanlages of irrigation. In other parts in ordinary years crops de well without irrigation.
- 107. Q. The supply is peronnial, but that does not explain the difference of demand on the other canals?—No.
- 103. Q. Aboat sapplemental wells, when a man grows sugarcane under a canal the area is limited by the water in the canal; with well water if he could irrigate his erop throughout the year, is it not a waste of water to give him canal water when he can irrigate from his wells?—The cases I refer to are in the Nasik district, where the wells ore silted up and the people take canal water.
- 109. Q. If the demand is equal to the supply is it not better to give water to the man who has not get a well?— I don't think we ought to penalise a man who has sunk his capital lu a well.
- 110. Q. You don't penalise him. You let him have his well water and give caual water to a man observers who has not got any water?—I would give it to the man who had a well.
- 111. Q. Why exerified protection to the interests of the man who has a well?—If the water in the canal is at all liable to fail, I think that the man with the well should be given the preference.
- 112. Q Suppose you had two applicants, one who had a woll and another who had not; would you not refuse the man who had the well and give it to the man who had not?

  —In the case of on ample water-supply I should still give the preference to the man with the well.
- 113. Q. Taking the Nasik case if you had an ample water-supply would you give it to the man with the well?
- 114. Q. Referring to famine programmes we find in Bijapur they have been living from hand le month. You have the districts Belgaum and Dharwar in which famine

has not been very frequent, have you famine programmes ready for these two districts?—Yss.

- 115. Q. How were those prepared, who was consulted?— The Collector consults with the Executive Engineer and sends in the programmee for the approval of the Commissioner and Superiotending Engineer.
- 116. Q. Are current Public Works Deportment works included. That is supposing you were going to make a new read presently, you would not put that in the famine programme?—Current works are not included in the famine programms unless they are works which are not likely to be carried out at once from ordinary funds.
- 117. Q. As a matter of fact they are not included ?-
- 118. Q. There is nothing to show how you arrive at the numbers of noskilled famine lahenrers?—We calcolate the probable numbers likely to go on relief works by previous famines.
- 119. Q. When you have the actual figures of a severe and recent famine, don't you think the actuals should be included in your slatement?—Yes, I think the actual figures of the last famine should be shown on the lamine relief works programme which provides for six months. .
- 120. Q. Have you a map showing these works ?-Yes one was sent to the Collector.
- 121. Q. In the case of large works on the borders of the district which would probably attract labour from the neighbouring districts, do you make any allowance for that ?-No, we make no allowance for immigrants.
- 122. Q. Is there a separate list for Clvil Ageocy Works?
  -- Yes, the Collector propares that.
- 123. Q. Sopposing the Collector puts down repairs to tanks, is there unything to ensure that the best possible work has been selected?—As a rule the repairs to tanks are generally clearance of drinking lanks.
- 124. Q. Is no survey or projects required for these?-
- 125. Q. Are there no works of that sort in your programmes?—No. On works such as field embankments some levelling is necessary.
- 120. Q. Are there any siles in your district whore new irrigation tanks could be made prefitably ?—There are sites possibly for small tanks to impound water.
- 127. Q. Could not money be profitably spent on such works? Yes. I think so.
- 128. Q. You have not been consulted as to the list of Civil Works?-No.
- 120. C. Would it not be better if both liste passed through your hands?—They do pass through my hands. But it is difficult for me to give an epinion as to what small works should be taken in hand.
  - 130. Q. You have not had a survey made ?- No.
- 131. Q. Would it cost much P—It would require n very large establishment for a general survey and would take a great many years to complete.
- 182. Q. Could you examine certain sites only ?—It would take a much smaller establishment if the Momlatdars could tell os first what tanks require repairs.
- 133. Q. De you think their information would be counted much F-Yes.
- 184. Q. Could you safely leave it in their hands P-Yes, they could be trusted to de this.
- 135 Q. As regards the larger works entered in the list, are the projects ready ?—No, many of the projects are not
- 136. Q And so if famloe came, you would be unprepared to some extent f—Yes.
- 157. Q. Could you get these projects ready in the ordinary course during the last 18 months with any extra establishment?—Yes.
- 138. Q. (Mr. Rajaratna Matr.) You said that under existing circumstances it is impossible to abelish the application system; could you not make a sattlement with the cation system; could you not make a sectloment with the rayals for five years based on the average of the previous five years and repulate your supply accordingly, letting the villagers declde how much over each man will take up?—I don't think the Government would like the Executive Englacer to guarantee water for five years in advance. Bestder a man would say he did not know what crops he was going le grew in the next five years.

Mr.

13 Jan. 02.

Mr. Cameron.

- 139. Q. You will still charge crop rates but fix the area and guarantee the supply?—I don't think it will work.
- 13 Jnn. 02.

  140. Q. You say to each rayat you bave been irrigating 3 aeres of gardon crop and sugarcans, we will make a permanent mrangement to anpply you with water and charge you necordingly?—It would be a long process, if we had to coosult each landowner.
  - 141. Q. You have to do that now every year, under the present canal system?—No, we do not ask them; they apply to us.
  - 142. Q. Mr. Visvesvaraya has made some such proposal. You take the water in the tank in the worst famine year as a beets and gnorantee one-third of the supply; would you care to try that in the Gokak Canal?—At Gokak the people are only too eager for water, so that I don't understood what the object of thet would he.
  - 148. Q. You practically introduce n consolidated rate. You got a fixed rovenue and all hother about applications is abelished. I am speaking of causis of unlimited supply?—The Gokak Canal supply can fail. It did so in 1900 for seven weeks.
  - 144. Q. How does the system of application onable you to provent frauds?—The canal authority reports the date of the first watering.
  - 145. Q. If the application was not put iu, and the Canal Ollicor was giving water?—The frand would be detected by the supervisor; and there is a ponalty for taking water without leave.
  - 146. Q. Then you don't think that application chenld be abolished?—No. I don't think that the application on the printed form deters people from taking water.
  - 147. Q. Mr. Whiting told us that the Patkaris often favour jeople?—I have not come across each instances; but I don't mean to say that the casal establishment is immendate.
  - 143. Q. With regard to supplemental wells, in connection with tanks of uncertain supply, do you think that if the canal rates were reduced by 1, in regard to those people who had wells, would the number of wells increase?—I do not know; but we might reduce the rates on the condition that a well would be sunk.
  - 149. Q. If additional takavi were granted, would the rayats be induced to sink copplemental wells f—Yes; I think they would.
  - 150. Q. The Deputy Collector has told us that, if the Gokuk Canal could be carried across a certain na'la, it would irrigate a large area of dry land?—Yes, an enormous area.
  - 151. Q. Whot would be the cost of that work?—I cannot toll you what the cost of nu aquednet over the Nallah would be, as I have not the figures with me here.
  - 152. Q. The Deputy Collector thought that people want water largely for the kharif crop?—In the mouseon we could give any amount of water.
  - 153. Q. It could be carried out without waiting for the big scheme?—It will be investigated ehertly; hut, I believe, that it can be carried out without waiting for the bigger scheme.
  - 154. Q. I believe the stream is two furlongs wide?—Four hundred and forty yards would represent a very wide stream; and the scheme will be very expensive.
  - 185. Q. Yon say that the wasto weir of the Mhaswad tank was lowered; to what extent did this reduce the capecity of the tank?—I have not got the papers here; they are in the Sholapur Divisional office. The dam showed signs of failing; and it was out down.
  - 156. Q. Is there any proposal to relse the weir to its former level?—Yes; this was merely a temporary arrangement.

- 157. Q. On the Krishos River, Is it possible to irrigate any large area, by means of oil engines or steam pumps f—That is a question I cannot mover off-hand; because of the cost of pumping. Whether the scheme is puncticable can only be determined after very careful investigation.
- 158. Q. (Mr. Muir-Mackenzie.)—Is it true the cultivators refers to use the water on account of the sacredness of the river; and that they will not take the water pumped, as it will be tonehed by profane bande?—I have not heard of that.
- 159. Q. (Mr. Rajaratna Mdlr)—Certain dotes no fixed for application; and we were told that water is not allowed for irrigation before that date?—Before the dates fixed, the rayats are not allowed to take water.
- 160. Q. If they asked water for two seasons, they will have to pny crop rates for two seasons?—Yes.
- 161. Q. Supposing a man applies for kharif crop early in January, you would not give him water before the 15th Juno?—No, certainly not, the hot weather supply is most volumble.
- 162. Q. What are the hot weather rates?—The ho weother rates are as follows:—

On seven works, Rs. 8 per nere.

On two works " 6 "

Ou three works ,, 4 ,,

- 163. Q. (Mr. Muir-Mackensie.)—The Pudkalkatti Canal would not go into the famine area f-No, only to the borders.
- 164. Q. Would it be advisable to slart the canol work, in anticipation of the tank heing made?—No, I would prefer to see the tank made first, as the causi would be useless without it.
- 165. Q. If you have the eanal complete, you, have only to etart the tonk?—I would rather put in the puddle trench first.
- 166. Q. But that would be further from the centre of labour?—It would. But I do not think the distance would be objectionally great.
- 167. Q. Yon have two sets of eight monthe' crops?—Yes, it depends on the time, at which the waler is taken. The first is up to the 16th January, and the eccond ect is up to the end of February.
- 168. Q. When must the applications for the first set be received !- Any time before the reason ends,
- 169. Q. By what date are you pledged for the eight months' crop?—At about the end of the moosoon.
- 170. Q. How for is the Irrigation Department pledged by the area under eight mentile' crops f—For the eight moeths' crops water is not pledged beyond Fohrnary.
- 171. Q. Is it pledged for a longer time for rabi crops?
- 172 Q. There are large pools of water in the Krishan, can they be ntilized P—No.
- 178. Q. Do you know any cites on the Warno River ?-
- 174 Q. I should like to see all these projects thoroughly investigated. You would not recommend the etoppage of the works on the Sangogi and Hullur tunks?—No; I think they are loss unprofitable than any alternative.
- 175. Q. Are you against the employment of famice labour on field emhaukmonts ?—No. But before they could be undertaken a complete scheme of these field cohemes would have to be got out. It then might be possible to make them in groups by famine lebour.

Witness No. 87,-Mr. H. F. BEALE, Superintending Engineer on Special Duty with the Irrigation Commission.

Mr. Bcale. 19 Jan. 02.

- Q., (The President.)—We are much chliged to you, Mr. Benle for the valuehole help you have given us; and for your carefully prepared report of irrigation works in the Bombay Presidency. It was a great pleasure to have ballyon associated in our investigations up to the borders of the Madrae Presidency.
- Mr. Beale.—It has been n great pleasure for me to have given such information as lay in my power; and I should like to add the following fow remarks:—

Repairs to 2nd class irrigation works, small tanks.

When the Poblic Works Department has repaired such to ake there should not be a recurrent annual charge for

meinleannee, because Gavernment have raled in Public Works Department G. R. No. 34 Wel—419 of 5th March 1895 that all petty repairs shall be carried out by the villagers. The petty repairs ore described as "filling in ratificles, making up banks worn down hy cattle troffic, closing smull water courses and similer petty earth work repairs," and the Revenue Department were directed to issue the necessary instructions in the matter to village officers and Circle Inspectors.

In practice, however, according to the Belgaum Executive Engineer's evidence, the petty repairs are often not done and the Revenue authorities cannot legally enforce

the carrying out of such repairs. Some legislation would, therefore, appear advisable, to secure a reasonable amount of care and attention being paid by the villagers to the uplant of the small teacher. keep of the small tanks.

### · B.—Bandharas in various districts.

There are numerous rakka bandharas in Khandesh and Nasik and it is stated (page 140 of the Roport for Bombay) that these were constructed and maintained by the Mahomedan Government. Before their construction there were undoubtedly temporary bundhams in their places.

The Bombay Administration Report, 1890-1900, shows that the "other sources" (besides wells and tanks) from Which water is drawn for irrigation are as follows:—

	Collectorate.			Pakka.	Kacha.
	Khandesh Nasik		."	. 70 . 234	37 244
				301	281
1	Ahmedungar Poona Satara	•	:	20 74 70	471 388 5,201

The proportion between pakka and kacha works of this Mr. Beale. kind may perhaps be due to the Mahomodau influence having been less strong in the latter districts, and partly also to some difficulty with foundations. But it is probable that in a large number of cases a masonry structure could be substituted for the temporary dams which are erceted annually at a cost of Rs. 50 to Rs. 100, and that the area of irrigation could thereby he improved and extended.

### C .- Irrigation of high class crops.

I have advocated in the report the encouragement of high class crops under irrigation works: but where it is not high class crops under irrigation works: but where it is not possible to increase the water-supply to a, canal, by fresh storage reservoirs, I would not recommend the encouragement of such crops to the exclusion of grain and fedder crops. It would, I think be advisable to give water to a "permanent" area of rabi irrigation, that is: to ascortein how much the cultivators will Irrigate from year to year, and let this be a first charge on the water. The remainder might be wholly given to perennial and garden crops up to the limit of the assured annual storage. Any excess of water in good years could be made use of as required. By this means a more or less certain area of irrigation might be secured, and the annual variations (except in the case of tanks with very uncertain supply) should be comparatively small. amall.

### Supplementary Memoranda, etc.

# (1) Mr. D. W. Hernert, Assoc. M. Inst. C.E., Under Secretary to Government, Public Works Department.

Answers to printed questions.

Mr. D. W. Herbert.

Proliminary Remarks.—I served as Executivo Engineer, Khaudesh district, throughout the Tamino of 1899-1900, but have never been in charge of irrigation works except in Sind, and am therefore not in a position to give much useful evidence.

5. Provincial Irrigation Works.—All the irrigation works in the Bombay Presidency, with the exception of the Gokak Storage Works, are financed from Imperial funds. The question of provincializing these works has several times been considered and abandoned. As land revenue is mainly Imperial, it would appear to be appropriate that the expenditure on works, which so greetly affects it, should also be Imperial.

It is believed that the majority of the large irrigation works in the Decean were constructed either for the purpose of relieving famine or as protective works, and the financial responsibility, for these and for completing the irrigation works commenced as founder relief works, could not, I presume, be undertaken by the Local Government under existing financial arrangements.

7. Wells.—Apparently the difficulty of obtaining fedder for the exen interfered in Khindesh to a certain extent with the usefulness of wells for irrigation purposes during 1900.

10. Programmes of Relief Works.—I would recommend, for the Hombity Presidency, that an Executive Engineer with three Assistants and about twenty subordinates be appointed for the purpose of getting up projects for famine

relief works. The above establishment would probably be able to complete a twelve mouths' programme in about two years at a cost of about one and-a-quarter lakks per annum. After the completion of a twelve mouths' programme, the number of assistants and subordinates night be reduced and a further reduction might be made after the completion of a two years' programme. The remaining establishment would be permanently employed for the purpose of maintaining the programmes, revising estimates, inspecting bench marks, rain ganges, tools, etc., and as a reserve in the event of a ismine. The Executive Engineer might also prepare a famine maunal including complete task tables and ready reckeners; he would, in districts where that difficulty is met with, propare a list of the places where water is obtainable in years of drought near the proposed works. He would arrange for the supply and distribution of a reserve of tools, and would carefully prepare and keep up to open of a famine.

Rhandesh was considered practically immuno from famine, and all the arrangomouts, programme, establishment, tools, etc., were sufficient, before the famine, for about a tenth only of the number that had to be relieved. Anyone who has experienced similar difficulties would be satisfied of the necessity for some such arrangement as proposed above, especially in the Bombay Presidency, where the Public Works Department establishment is short of requirements oven in normal times.

## (2) Mr. H. S. Lawrence, I.C.S., Acting Director of Laud Records and Agriculture.

#### MEMORANDUM.

1. The points upon which information is required are detailed in Government Momorandum No. P.-1053, dated 21st September 1901, and the appendix to Government Resolution No. 2275, dated 26th October 1901, and are referred to in the margin of this report.

2. It will be convenient to separate the districts not merely into Gujarat and Deccau, but as shown nuder, into-

Gujarit," Karnatak Konkan. Deccau. Khándesh. Belganm. Thina. Alimedobad. Lijapur. Kaira. Panoh Mahals. Kolúba. Nasik. Aluneduagar. Dhárwár. Rotnhgiri. Poona. Broach. Kaoara. Sholapur, Surat. Sátára.

3. Up to 1985-1886, irrigated areas were shown under The existing state and progress the general heading "Irdaring the last 30 years or period for signted garden lands on which information is available, of tanks, water-courses, otc." irrigation by smaller lanks, dams, water-courses, otc. "From 1885-86 tn 1892-93 miror works of irrigation.

Channels, well of rightion. They were divided under Gevernment Memorandam No. P. the headings "Canals" 1053.

From 1892-1893 the following sub-division has been made:—

(1) Government canals, (2) private eanals, (3) wells, (4) tanks, and (5) other sources.

This classification is, however, only approximately correct, as when an area is irrigated partly from wells and partly from tanks and canals, it is entored under the head which is the principal source of irrigation.

Table I gives the information available from 1892-88, and an abstract according to agricultural divisions is odded in Table II.

Attention is invited to (1), the failure of tank irrigation in 1899-1900, which in Gujarat fell from 14,182 acres in 1898-99 to 693 acres, and in the Karastak from 92,355 to 24,480 nores.

(2) The large expansion of well-irrigation, especially in Gujarát, from 93,601 in 1808-99 to 183,216 acres in 1899-1900.

It is to be observed that in 1896-97 the rainfall, though so unseasonable as to cause famine, was not below the average throughout the country, while in 1899-1900 it was

exceedingly deficient. In consequence there was a sufficient supply of water for the Government canals, tanks, and phits in the first year, but in the second, when the need for protection was still more urgent, these sources proved ineffective. The figures strikingly illustrate the superior value of wells as the most reliable method of protection.

4. The gross and culturable areas in each district and the proportions of the latter which are protected by Government irrigation the proportion of irrigated areas to culturable areas.

Trigation Commission Memorandum, paracraph 2 (1).

Gross and culturable areas and the proportion of irrigated areas to culturable areas.

Lago works and by wells respectively, are entered in Table III.

5. The character of the soil in the various tracts is fully Irrigation Commission Memorandam, paragraphs (1). Character of the soil.

31 of Mr. Mollison's Text Book on Indian Agriculture, Vol. I.

In briof, in Gujarat the seil varies from sand, in Ahmedabad through alluvial leams, in Kaira to the black clay leam of Breach and Surat.

In the Decean the ralloys contain "medium black soil of moderate depth with murnm or trap as the underlying stratum;" the uplands have thin soil of disintegrated trap.

The Karndtak has clay leams of great natural fortility.

The Konkan has stiff ferruginens clays for rice, light sands for gardous, and poor stony uplands for dry-crops.

6. Nowhere is cultivation solely dependent on artificial irrigation Commission Memoran. irrigation. In all cases dum, paragraph 2 (3). Dependence such irrigation is in aid of natural rainfall used for the production of more valuable crops.

7. Statistics for ten years as recorded at the head-quarter Indigation Commission Memoran stations of districts are dam, jurgaraph 2 (4). Hainfall. ontered in Table IV. Pages 3 and 4 of the Statistical Atlas of the Presidency, may also be consulted.

Trigation Commission Memoraudum, paragraph 2 (6) and (0). Is there ordinarily a demand for mater in Cultarit during south-west memoon? What are the crops which require irrigation, etc.?

Gorerament Memorandum No P.,

A. The system of ascessment on wells was handed down from the Maratha rule, and having been from the earliest days of British rule recognised as a tax on improvements effected by the mynt has been gradually transformed or abolished.

No additional charge whatever is imposed on the construction of a new nell.

The system under which the land nesessments now in larce were imposed ratios in different tracts.

In dry and arid districts of the Decean (such as Iu-dunar and Madha) lands found under irrigation from wells at the original scittement and then assessed on garden land were assessed within the maximum dry-crop

Lands under new wells, that is, these constructed during the original settlement, were as cosed at the ordinary diy-

In the districts of the Decean and Southern Maratha Country with greater command of subsoil water and where well hirigation was found to have been carried on on on extensive scale, lands with wells, whether old or new, that is, whether existing from a date anterior to the introduction of the original sottlement or constructed since, were

classed a little higher an account of command of water and nesessed at day-crop rates, the asso-maent in no case exceeding the noll assessment previously levied.

Act IV of 1886 amending the Land Revenue Coda laid down (Section 10.1) that when a general classification of the soil had been mode a second time, or any original classification had been approved by Government as final, no future change of classification should be made. This now covers all cases; the Surres Department has been abolished, and the utilisation of water advantages is entirely free from any risk of fature enhancement.

10. In the Gujarat districts a subseil water rate was substituted for all assessments on wells, in accordance with the fullowing survey rule :-

Where in any tract in a viltage which is well defined and of uniform character of sait, the subsoil water is shown by that of the wells existing in it to be of uniform quality, every survey number in theirrost, though as yet without a well, shall have its subsoil water classed in the same order as that of the survey numbers which have wells."

No addition was made by this subsoil assessment to the total receive demand of a village, but when that domaind had been determined on general considerations, the subsoli-nessesment merely increased the share of the total demand imposed on those fields which possessed superior irrigational potentialities.

When the asses ment of a field had been calculated When the assessment of a field had been calculated according to the mothed of soil classification penuliar to the Bombay system, a percentage was added which varied according to three factors—the factility of the soil to be irrigated, the depth at which unter was obtainable, and the quality of the water. The percentage varied accordingly from 2 per cent, to 50 per cent. It is impossible to acceptain the incidence of this sub-oil water assessment in all cases, but from the ligarest entered in the subjoined statement, it appears that in representative thinks of the Kaim and Surat districts it amounted to from 3 to 7 per cent, of the ordinary assessment. the ordinary assessment.

11B. Dhekudi or Budki is a pit or well in the bank of a river, nala or tank connected therewith by a channel.

In the Decean and Southern Maratha Country since 1874 "lands within a certain distance from a stream from which water could be obtained by means of a budki were classed at a higher rate and assessed at a rate not exceeding the maximum dry-crop rate in the garden had existing at the time of the last settlement and at the simple dry-crop rate on the land under wells or budkis constructed since that settlement.

In the Gujarat districts of Panch Mahols, Ahmednhad and Knirn, subroil water assessment has been substituted for the special rates formerly obtaining.

In Surnt where the rivers do not change their course, and dhekudis can, therefore, se unde permunent, a percenting addition is unde to the accessment of fields within 30 chains of the etream, this addition varying according to the depth to water in the dhekudi, and the percential or seasonal supply of water.

12C. Tanke,-Irrigation from tanks takes place on a and seed, except only in the District of the Karastak, where in 1898-90 some 82,000 acres received it (ride Table I). The assistance derived is included in the classification value of each field, so many annas for comwand of irrigation being added to so many annas for soil fertility, and a consolidated rate is imposed accordingly.

18D. Canals and channels.—Patasthal assersment is fully treated in a note by Mr. Ozanne, late Surrey Commissioner, printed as an Appendix to Government Resolution No. 712 of 28th January 1897, on which the following summary is based :-

"Under the existing law there are three different forms, Three different ways of charging in any one of which rates for the use of water, right to which verts in Government, are chargeable, viz.:

- (a) By the Irrigation department under the provisions of the Irrigation Act, provided no rate is charged under either section 55 or section 101 of the Land Revenue Code.
- (d) By the Collector under the provisions of section up, provided no rate is charged under either the Irrigation Act or Section 101.
- (c) By the Survey Department under section 101' Land Revenue Code, provided no rate is charged under either the Irrigation Act or section 55 of the Land Berenvo Code.

"The Irrigation Department leries the water rate in the Irrication Department system; of form of a crop rate, rating. Crops the amount of water required, and the charge is taken in full only when a full supply is given.

"The rates charged under section 55 are also generally Raicrehared under section as of in the form of crop rate. Land thereare Code.

These rates have always been treated as temporary and lasting till the imposition of a Ragait assessment under section 101, or, if the water is supplied from works constructed and maintained by the

Irrigation Department, the imposition of rates under the Mr. H. S. Irrigation Act.

"The assessment fixed under section 101 forms an integ-"The assessment fixed under section 101 forms an integ-Fiche the pitaethal area and its ral part of the ordinary sassament. In a revenue and is in-oluded in the guarantee given at the time of settlement. It is fixed on an average and is leviable irrespectively of the actual water-supply available in any one year and irre-spectively also of the actual are made by the rayat who is at liberty to irrigate any part of his field whether less or more than the area assessed as parasthal garden, for this is not a definite demarcated area, but an average area according to the judgment of the survey officer." the judgment of the survey officer.

The latter survey assertment is a consolidated soil and water rate assessed according to the quality of the soil and the ordinary permanence of the water-supply.

Irrigation Commission Memorau-dum, paragraphs 3, 4 and 5.

14. No exact information on record.

Paragraph 6 (t) and (2).

By whom district or sillage works are constructed and controlled? humber of such works and agengate extent of cultivation dependent on them.

15. District or village works are represented by tanks. They were constructed for the most part originally by former rulers; the statistics (vide Table V) show ma increase of 27 per cont. in their number from 8,748 to

their number from 8,748 to 11.115 between 1886-87 and 1896-97, but this is probably due to imperfect classification of tanks in Kanara, which irrigate half an acre apiece, having been reported to have increased by 1,500 or 50 per cent. In Belgaum also there was an increase from 445 to 559, and in Ahmednagur a decrease from 135 to 6. The causes of these variations are not on record in this office, but outputy is being made.

In the Karnatak a considerable number were constructed and are controlled by private owners. The more important table are controlled by the Public Works Department which repairs them.

The average arreage injigated was 102 acres; this average is the result of figures so divergent as in Breach, Khamlesh and Kangra one-half an nore, and in Panch Mahale and Bijapur 105 and 107 acres per tank.

16. The responsibilities of Government in regard to their

lerigation Commission Memoran-dum, paragraph 6 (3).

Responsibilities of Revernment in connection with the maintenance of district or sillage works as fired at former settlements.

Constituent in regard to their maintenance were discussed by Committees which were appointed in 1892. The orders of Greetmuont upon their recommendations issued in Government

Revolution No. 34 W. I.—419 of 5th March 1895, Public Work- Department. It was decided to revise the list of tanks from which irrigation revenue was derived, to ahandon such as would require an excessive expenditure to place in efficient order (and where necessary to reduce the assessment accordingly), and to entrust the repairs of the remainder to the Public Works Department.

Number of new wells.

Wells used for irrigation wells viewed by.

Enquiry is being made as to the number new next steam, and the information will be furnished to the Commission at the end of the month. Commission at the end of the month.

Irrigation Commission Memoran-dum, paragraph 7 (3).

Extent io which construction has been assisted by advances from Government.

During the ten years ending 1899-1900 advances for canstruction ond repair amounted to Rs. 57,61,746. The repair of an old well may roughly be estimated to cost Rs. 50, and the construction of a new well Rs. 200. If we assume that oos-fourth was spent on the repair of old ond the remainder on the construction of new wells, the number of wells newly constructed will amount to 21,610 and those repaired to 28,808, or, raughly, 60,000 in all.

23. Freedom from enhoncement of assessment. Irrigation Commission Memoran. porhaps doubtful whether onlivators have complete constructors of new wells. concession, though the fact that they have taken leans of Rs. 57 likhs for the purpose

would appear to show that they were free from any serious apprehensiaus. The distribution in villages of vernacular notices on the subject, a measure which is understood to have been adopted with success in the Central Provinces, would perhaps stimulate construction.

These points are not perhaps within the reference to this Department, but it may be Irrigation Commission Memarandom, paragraph (6).

Is it possible or desirable to attained the condition of advances repear to be saffimalate the construction of new weite by more liberal advances or inducesplitty of diminishing advances of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition of the condition o

Previous to 1891 takevi

the etress of disastrous seasons, the system has expanded enormously. In the different tracts there are considerable

differences in the purposes for which the leans are Mr. H. 'S. Lawrence. demanded.

Of the total amount of 1043 lakes of rupees advanced, 62 per cent. was devoted to irrigation, and 37 per cent. to other land improvements, and I per cent. unspecified.

In Gujarát before 1899-1900 the same advanced did not exceed Rs. 43,000 in any year, owing, it is believed, to the excellent credit possessed by the Patidar class and the easy terms on which they received accommodation from the money-lender. In 1899-1900, however, Rs. 6 lákhs were taken in Gujarat entirely for the construction of

In the Decean in the famine of 1826-97 Rs. 17½ lakhs were given for this purpose, and in the ten years the total amounts to Rs. 39½ lakhs.

In the Kurnatak the expenditure on wells and other works of irrigation was inconsiderable in comparison with the expenditure on the construction of embankments and other methods of Field improvements, such as the uprocting of Weeds.

29. The subjoined subsidiary statements summarise these variations :-

30. The statistics of the yield of crops prepared in 1897 are entered in Table IX. Government Memorandum No. P.-1053., Crop Statistics. The method in which they were prepared is explained in the fellowing extracts from the Memerandum by Mr. Muir-Mackenzie, then Survey Commissioner, which accompanied the report :-

"The general result has been that in the Deccan the estimated yields are considerably below the formula figures of 1882. The yields new returned were in the first instance worked out by the Deputy Director of Agriculture, Mr. Mollison, on the basis of the formulæ, crop experiments and personal observation. They were then observed by myself and further revised in discussion with Mr. Mollison. Lastly, Mr. Hearn, the Superintendent, Konkan Survey, was consulted regarding our final estimates. Mr. Hearn has probably taken more experiments and knews more of the yields of the ordinary crops in the Konkau and parts

of the Decem than anyone in the Presidency. He fully discussed the yields with Mr. Mollison and agreed with those at which he and I had arrived. Mr. Hearn, who was one of the framers of the original formule, admitted that the low yields of the poor soils and precarious climates were not enough allowed for in some districts when the formulæ were prepared.

The yield of irrigated crops has been mere closely ascertained and stated. Experiments and results on the Poena Farm have brought accurate knewledge of the yield of sugarcane. There can be no doubt that the tendency hitherte has been to greatly under-estimate the production of cereals under well irrigation."

The crop experiments which have been conducted since . 1897 have, awing to the abuermal seasons and the absorption of efficers on famine duties, not been sufficiently numerous to justify any alteration of these figures.

Mr. H. S. Laurence.

Norr.—As rice generally gots only a few waterings at the close of the season, no figures for irrigated rice have been separately shown.

Information on some of the points mentioned in the mamorandum of questions by the Irrigation Commission, embodied in Government Resolution No. 2275, dated 26th October 1901.

τ.

2. The gross area in the district is 3,742,671 acres.
The culturable area in the district is 2,511,017 acres.

A statement comparing these acres for the last five years is attoched (1).

The soil of the open country ranges from deep black loam to light-coloured grovel; in the hilly country (? laterite) soil is found in places. The general geological formation is Deccan trap.

Nearly all kinds of kharif and rabi arops grow in the plains, especially wheat, hajri, jowari, gram and sugarcsne, etc.; rice also grows where it gets abundant canal water.

The soil of the rainy hill country produces rice, nagli varái, tur and udid. Whest, bajri and gram are also grown on this soil, but only to a small extent.

Extent to which cultivation is dependent on artificial irrigation.—Statement No. II will show the extent to which the different crops are dependent on irrigation.

#### RAINFALL.

The average ruinfall of the Néaik district at headquarters during the rainy season is about 30 inches and at taluka head-quarters it is as undar:—

					Inches.	Cents.	
Sinnar					. 26	28	
Igatpuri					. 143	83	
Dındorl		·			. 31	39	
Niphád				·	25	31	
Chandor			•	•	. 27	84	
Yeola					. 24	53	
Malegnon		•			. 23	27	
Nándgaoi	1				. 28	74	
Báglan					. 21	40	
Kelwan					. 27	69	
Peint	_				. 91	32	

The average is for elevon years (1887-1897) as found by the Survey Commissionar and published at page 88 of the Bombay Government Gazette, Part III, for 1900.

How the distribution of water is controlled.—In the case of bandharas in obarge of the Rovenno Department, i.e., the revenue of which is credited to Land Revenue, the distribution is controlled by the village and taluka authorities. They see that the irrigators take water on fixed days and at fixed bours and irrigata only anthorized parts of the fields.

In the case of handheras in the charge of the Public Works Department, i.e., the revenue of which is credited to that Department, the distribution is controlled by the officers of the Public Works Department and also by village officers concerned, to whom information about the grant of water is supplied, and they control the distribution accordingly. Petitions are received by the officers of the Public Works Department for water for a particular zero, and they dispose of them according to the cupply of water in particular year.

In what form the irrigation revenue is collected.— The phrase "Irrigation Revenuo" is applied only to the bandham revenue creditable to the Public Works Department. This revenue is realized in the form of water-eess which is fixed by the Public Works Department according to the nature of crops for which water is allowed. The collection is munaged by the Ravanno Department. Village officers collect the revenue and romit to the Taluka Trensprice on receipt of statements annually from the Public Works Department.

- In the case of Revenue handharas the assessment is collected by the village officers with other items of Land Roycune.
- 6. By whom district or village irrigation works are constructed and controlled.—District irrigation works are constructed and controlled by the Public Works Department and village works by the Civil Department.

Number of district or village irrigation works and the aggregate extent of cultivation dependent on them.—The following is the number of district and village works:—

						٠.	713.

Nandgaor	l	•	•	•	•	•	2
						•	
					Total		282

Besides these there are the Paronl, Ozar, Tambat, Pal-khad, and Wasali Canals.

In all there are 280 canals of varying size.

Responsibilities of Government in connuction with the maintanance of district or village works as fixed atformer settlement.—In the interest of the irrigation revenue Government must keep the works in constant repair, as if the scorce of irrigation falls the revenue must be remitted.

In the case of the older works the repairs of the channels and water-courses are carried out by Government agency, but 10 per cent. of the cost is recovered from the irrigators. There is no dicticet unthority for this precedure. Repairs to the main heads, tanks, etc., ere, however, carried on entirely at Government expenses. It is to be observed that not a few of the minor dams (bandharas) are at present ailted up and necless.

Have new district or villaga irrigation works been constructed of lato years otherwise than as famine relief works?—No new district or villago irrigation works such as would be useful to onlivation have been constructed of lato years. The Khirdi Sathe, Olel and Chankapur tanks have been begun but not completed.

Noither private land owners nor the District Local Boards have undertaken or can undertake such works: nor can Government afford money for loans to them for such purposes.

The works constructed in the late famines as well as those existing before them have considerable value as sources of water-supply for men and cattle without raference to irrigotion.

The following sums were expended on village tanks in the late famines of 1899-1900 and 1900-1901:--

					Rs.
1. Hiswni Tank					1,267
2. Sherul Tunk.					1,758
3. Dowolghat Tank				1	723
4. Khadke Tank					2,332
5. Dapure Tank			•		1,929
6. Sayane Tank					4,968
7. Zodge Tank .	,				3,065
8. Palasdare Tank					380
9. Chikhalwahal Tu	ık				1,838
10. Kalamdari Tank					135
II. Pokhri Tank					929
			•		193
12. Ménikpanj Tenk					132
13. Raugari Tauk		•			1,619
					21,288
				΄, '

la. Mapurwadi Tank		٠,٠		· •	6,578
16, Sonaj Tank			•		6,615
		,	٠ َ و		<u> </u>
			-	٠,	49,279
-#		•			

Of the above-mentioned only two were completed before the mensoon of 1901, viz., the Maparwadi and Sonoj tanks.

As the rainfall of 1901 was inadequate, it is not yet possible to soy how far the works will be usoful.

The protective value of the Docan irrigation works during the famine of 1897 was considerable, but in 1899, 1900 and 1901 it became less and less in each year as the rains were less heavy and the subterronean springs gradually failed.

No accurate statistics, such as can be relied on as data for a scientific inquiry, are available as to the areas irrigated in the year 1897 and subsequently, but in Statement No. 1 rough stotistics are given.

Fomine relief was necessary to some extent in the form of omployment on relief works and also in the form of gratuitous relief in most of the villages protected by irrigation works. In the case of agricultural lobourer and non-agriculturists residing in sooh villoges, as in the years of drought they could not get usual field-labour to the follest extent owing to the high prices of groin and the diminution of area cultivated, agriculturists foiled to employ the usual number of labourers and did much of the work themselves. Such labourers and their dependents had therefore to be relieved at the works or by dole. It is beyond doubt, however, that the cest of famine relief would have been more if the irrigation works land not been in operation, as in that case a greater number of agriculin operation, as in that ease a greater number of agricul-turists themselves would have resorted to relief works.

· Statement No. I showing culturable and irrigated area, Násik Division.

#### Explanation.

Column B represents the total area of the district.

Column 4 inclodes not area cropped (after deducting the area cropped more than once), current fallows and
assessed and massessed area available for cultivation.

Column 5 represents area commanded by Government canols directly managed by the Irrigotion Department and

the revenue derived from which is exclited to that Department.

Column 7.—The figures in italies in column 7 show the area in acres noder well-irrigation, while the reman figures represent the percentages of this area with reference to the total outurable area. This information is given only with respect to well-irrigation which has been taken to mean "artificial irrigation."

Column 9 represent area—advantaged.

Column 9 represents area under pais and bandhares managed by the Revenue Department and the revenue derived from which is credited to that Department.

Statement No. II showing the names of crops irrigated and the number of waterings they require.

## Answers to printed questions.

- 1. The onswers helew refer to the Nosik district.
- As I only came to this district in April 1901 and have never seen it before, I cannot say that I am well acquainted with it as yet.
- 2. A stotement chowing the average rainfall in each month of the year at the head-quarters of the district and also at the head-quarters of each of the talukas in the district is uttached.
- 3. Practically there is no obstacle to the extension of irrication arising from-
  - (1) Sporsity of population.
  - (2) Insufficient supply of cattle suited to the cultivotion of irrigoted lund. In the famina of 1899-1900 a large number of cattle died in the district, but this mortality did not tell upon irrigators as lu irrigoted londs the cultivators had reaped the usual khondya and kodyal orops for their cattle and caved them.
  - (3) Insufficient supply of manure. I de not think this would prove un obstacle.
  - (4) Unsuitability of soil (e.g., black cotton soil) to irrigation. In this district cetten soil exists in soveral tálukse and irrigated crops are grown in it. Generally speaking, the soil of the plain is suited to irrigation.
  - (5) Uncertainty of water-snpply. There is something in this. Canols and reservoirs not fed direct from the miny regions of the Ghonts are alreys liable to give out early, and well-sinking is nlways somewhat of a speculation in the Decean. Even where weter is found, it not unfrequently rans short in seasone of drooght.
  - (6) Capital would have to be berrowed for the most port. Whether it would be procurable would largely depend on the extent to which Government could give tagai and on the effect produced by the recent amendments to the Land Revenne Code. These latter will for a time canso a lock-up of lesnoble capital.
  - (7) Fear of enhanced rent or revenue assessment does not deter or discourage irrigators from oxtending irrigation, as they are willing to pay n proportionate share of the preduce they reclize from improvements.
  - (8) Uncertainty of tenure or defects of the Teooney Law.

The tensney in this district is the Alirási tenure, under which the cultivators have no feor of their lond clisnging hands except through their own funlt in net paying the assessment or incurring debt. Caness 5 and 6, viz., the uncertainty of the empty of water, otc., or lack of copital, expenditure, etc., have, however, often acted as obstacles to the extension of irrigation.

- 4. In section 107 of the Land Revenue Code provision has been made to safeguard the improvemente made by cultivators to their own leads at their own expenses.
- 5. Losns under the Land Imprevement Loons Act are taken freely fer the extension of irrigation by 'the people who cm furnish security, s.c., generally by those whose lands are not mortgaged, etc. I do not recommend any of the messares (1) to (6).
- 6. The extension of irrigation does not tend to injure the remaining collivation by attracting its cultivators to the irrigated tracts. Still I have no doubt that the people of this district would welcome the extension of means of irrigation to their unirrigated land.

- 7 and 8. The irrigation increases the value of the produce of land-
  - (1) by rendering it possible, to cultivate two harvests instead of one;
  - (2) by leading to the substitution of more far less ' . valosble crops er varieties;
  - (3) by increasing the yield-
    - (a) in a year of ample rainfall;
    - (b) in a year of scanty rainfall;
    - (c) in a year of drought.

It is difficult to say to whot extent sxactly irrigation increases the value of the produces of the land, but from local inquiry it uppears that in the first ease it increases from 50 to 100 per cent.; in the second from 25 to 75 per cent.; in the third (a) from 25 to 50 per cent.; in the third (b) from 40 to 75 per cent.; ond in the third (c) from 50 to 100.

I can give no trustworthy estimate on this point.

9. The annual rate per acre paid on account of irrigation by the owner of land to Government varies from Rs. 6 to Rs. 20. This rate is paid to the form of a water-rate and is recovered either along with the rent of land or separately as irrigation revenue.

The annual rate per acro paid on account of irrigation by the cultivator to the owner of the land varies from Rs. 10 to 25. In these cases the rate is not payable on the area actually irrigated during the year. The cultivators and owners of land fix a sum of enuol rent by mutana agreement on one or more survey numbers contoining irrigated and unirrigated land, and the agreed amount of annual rent is paid by cultivators to the owners of land.

In reference to the cause in charge of the Rovenou Department, the rate fixed by the Survey Department is poid annually. This rate is not changed during the period of settlement.

With reference to the canals in charge of the Public Works Department, the rate for water is paid according to the rates fixed for each kind of crop sown in a particular area and not for whole numbers, etc.

10. The extent to which privite expenditure is necessary to bring water to the field or to prepare any land for irrigotion is dependent on the quality and situation of the land.

This expenditure is generally incurred by the landlord in the first instance, but when it is incurred in special cases by temants the period of tonnecy is comparatively longor without a preportionoto incresso in the rental, which secures bim against losses.

- 11. No appreciable domage resolted to the people or deteriorotion to the soil from irrigation without manner, from too profuse or too extensive irrigation in this district.
- 12, 20 and 21. (1) Conals or groups of conals of intermittent flow in the Nasik district are supplied with woter from nolas, across which temporary doms are thrown up by the rayate at their ewn expense and the channels are also kept clean by thom.
- (2) The irrigator is allowed to take water upon the condition that he does so without stopping or injuring the current and only when his turn comes. Turns are fixed by the village panch. No instances have come to native in which the rights are mismmoged in only one village, though there have heen cases in which two oramore different villages have disputes about the proportions of water to he taken by each, and the Civil Courts are a sufficient remedy ogainst these.
- (3) (a) In years of ample rainfall water is maintained generally from November to February

Ronus.

- . (3) (b) In years of sennty rainfall it is maintained from November to the oud of December.
- (3) (c) In years of drought during November (if the naise continue to flow) or perhaps only during September and October. .

Answers to queries Nos: 13 to 19 may be deduced from the answers to Nos. 7 to 11 above mutatis mutandis, though the advantages of an intermittent flow must of course be less than those of a caual of continuous flow.

22. There is no necessity for encouraging and assisting the construction by private persons of further canala, as wherever there is a possibility of extending or introducing irrigation in any locality by kacha dams the people have never neglected them.

Where, however, tacha bandhams are necless, puere ones are beyond the power of the rayats; and I have observed in several places pueca dams which have silted up and become nseless.

#### TANKS.

Nov. 23 to 33. There are only two irrigation tanks in the district (Waghad tank and Pared tank), but no direct use of the water of the former tank is made for irrigation.

It is a storage tank supplying the Palkhad bandhara, from which the water is distributed for irrigation by channels.

In the case of Paraul tank the water is supplied direct to three villages of the Malegam Tolnka by menns of a channel.

Both the tanks are formed by damming rivers. The chief source of apply is the floods in the rainy seasons.

The water of the Waghad tank and its tributary channels does not generally fail even in years of drought, though of course it is much list in these years; whereas the Parsal tank rans dry during years of scaoty rainfall vory soon after the monsoon is over.

24 to 28. See replies above mulotis mulnadis.

29. The expenditure is home by the tenant.

The management of the canals is entirely in the hands of the Irrigation Department, and the Irrigation Act is cofficient for all practical purposes.

31 and 32. There are no private tanks, and none can be assisted or expected.

83. Can best to answered by officers of the Irrigation Department.

31. The district of Nasik is divided in two parts, plain and billy.

There are very few permanent walls useful for irrigation in hilly tracts.

The following information relates to the wells in plain

(1) The depth of permanent wells varies from 15 to 40 feet.

- (2) The nature of samply is generally from springs, Mr. A. R. but these near rivers and nalas or tanks get supplies by percolation also.
  - (a) In an ordinary year it is not generally liable to
  - (b) But in years of drought it is liable to fail, or at least to get low in many wells.
- (3) The cost of coestruction varies from Rs. 400 to Rs. 1,200.
- (4) The duration of a well varies from 10 to 40 years.

  The duration is chiefly dependent on construction. There are come wells said to be 100 years
- (5) The water is usually raised by means of leather buckets, called sacts, drawn by two ballocks.
- (6) The average area attached to and commanded by a well is three acres.
- (7) The average area irrigated in an ordinary year is about three acres, and in a year of drought about one acre.

Answers to Nos. 35 to 37 will be found above (7 to 11), although irrigation from walks is less liable to produce water-logging than channel water.

- BS. Seriene difficulties are encountered-
  - (1) in the selection of a spot in which a supply of water will be obtained;
  - (2) in the actual construction of well, as the cultithe actual construction of wen, as the cuntralors or experts in villages have an oye for such springs and do not generally fail. The average village mason is fully competent to build an ordinary well. No assistance has ever been offered by Government or by local bodies in the chape of expert advice. In the last in the shape of expert advice. In the last famine tagai was given only to those owners in whose fields trial shafts showed water. This district po-sesses a boring apparatus, but I am not aware to what extent it was used in the famins of 1890-1900.
- 39. Under the recently introduced non-alienated tenure, Government may with advantage construct wells in private lauds, but not in lands held on the ordinary toute. The construction might be iffected either by tagai loans, or else in the same way as ordinary public works.
- 40. Temporary wells are not commonly used in this district. They are not a protection against drought us the soil is annuitable for any except pueca wells. In a few places bloudlis have been dag in the beds of nales, but they are of little use in times of drought when the sunles do not even provide sufficient drinking-water for men and entile.

Statement showing the average rainfall in each month of the year.

Mr. A. R. Bonus. III.

Supplementary Note on point No. 7 of the Memorandum of points to be considered by the Indian Irrigation Commission.

Total area irrigated-

				Acres
(a) in ordinary years	•	•		81,472
<ul><li>(a) in ordinary years</li><li>(b) in years of drought</li></ul>	•	•	•	91,200

The former figure is an overage for five years from 1891-92 to 1894-95, and the latter is also an average of two years, viz., 1896-97 and 1899-1900. In the former year 108,385 acres of land were irrigated and in the latter 74,086 acres only. The water-enptly was abundant in 1896-97, while in 1899-1900 it was scanty. Number of new walls constructed annually during the last ten years

1901		,	•		. 1,089
					-
					6,855

Construction of wells was assisted by Government to the following extent:—

Advanced for constructing wells in 1899-1900 . . . . . 1,34,241 . Advanced for constructing wells in 1900-1901 . . . . 1,26,452

No concession other than that loid down in section 107 of the Land Revenue Code is given to the constructor of new walls. Till the expiry of the sottlement for the time being in force no water-rate or hagait assessment is levied on land irrigated from new wells in a survey number. Though it is desirable to stimulate the construction of new wells by more liberal advances or inducements, it is not practicable under existing circumstances to do so to any great extent. Under the present rules for granting tagal which require substantial scentity, comparatively few grants can be made. There are no trustworthy dots to show the extent to which wells were affected by successive droughts for 1899 to 1901.

Last year, Mr. Moore, whils on tour in Môlegaon, collected statistics of wells that had run dry. In six villages out of 329 wells, 240 had become dry hy the middle of December 1900.

Most of the wells which had run dry were deepened, and the results were partially successful, a temporary increase of supply being obtained in about three cases out of every four.

The average distance of water helow surface level varies from 10 to 30 feet and, the cost of wells used for irrigation varies from Rs. 400 to Re. 1,200.

The area served by each irrigation well in normal year varies from 5 to 15, or in rare cases 20 acres.

#### (4) Mr. R. A. Lamp, I.C.S., Collector, Ahmednagar,

Answers to printed questions.

Mr. R. A. Lamb.

I was Collector of Poona during 1897-1898 and of Ahmednegar from the end of October 1899 to the end of May 1901. I served as Assistant Collector in Khaudesh for about 61 years.

- 9. The uncertainty of the outply is a defect which, in my judgment, applies not only to wells and village works as Mr. Bronden points ont, but also to all works which are not fed from an area of assured rainfall. As yet there are no works in the Nagar District which are so fed. I submitted some months ogo a separato report to Government indicating where I thought such works might be constructed [Question 3 (5)].
- S. I am doubtful of the propriety of granting any remission in the case of failure in the attempt to obtain water [Q. 5 (4)] and of moking Government grants-in-aids of private wells [Q. 5 (6)].
  - 4. Question 6 (1) No.

(2) No.

(3) Yes.

- Section B. There are none in Nagar. The immense value of such canals was very manifest in Poona in 1806-97, to anyone passing through the villages, nuder the Nira Canal.
- 6. Section C. Under this section fall not only the village works regarding which Mr. Breudon has furnished information, but also the Ojhar and Lakh Canals which are Public Works Department works. The uselessness of these canals in years of scauty rainfall and of drought will be cured when the Makaladeri tank is completed. I concur generally in what Mr. Breudon says regarding village works.

- 7. Section D Q 23 (1). One Bhatedi tank is supplied with water by the surface flow of several nales all lying within the area of uncertain rainfall.
- (2) The water is distributed to the land by canals and
- (3) (a) I do not know.
  - (b) The supply ceases before the end of the cold weather, earlier or later occording as the rainfull is more or less scanty.
  - (c) In a year of drought there is no supply.
- (4) The area irrigated can be obtained from the records.

  8. Q. 2.—I have no knowledge of the working of the tank in a year of ample rainfall. In years of seanty rainfall one crop may be raised on a restricted erea or there may be no crop. I do not think that canal-watered land is ordinarily watered from wells also. (Q 26). There are not to my knowledge any tanks constructed by private persons, nor is it necessary to encourage such construction (Qs. 31 and 32.) The tank silts up badly. (Q 33).

  9. Section E. I concur generally in Mr. Brendon's report on wells. I do not consider the extension of well-digging a
- O. Section E. I concur generally in Mr. Brendon's report on wells. I do not consider the extension of well-digging a sound protection against fomine, because in years of drought or of continued soanty rainfall the subsoil water falls so low that only a restricted area or none can be irrigated in the fomine years, and because the tendency is to allow all but the hest wells to full into disuse during years of good rainfall, so that when famine comes a considerable or great number of constructed wells are no longer nvailable for irrigation. The selection of a spot in which to sink a well is largely a matter of luck (Q 38). I do not think it is the business of Government to sink wells in lands which are private property, or in occupied louds.

(5) Mr. B. P. Milson, M.I.C.E., Executive Engineer, Sholdpur District.

Answers to printed questions.

Mr. B. P. 2. The character of the soil of the district, generally speaking, is muramy in the higher-lying portions of the district, with black soil in the valleys.

The average rainfall is shout 20 inches.

The crops that require watering are-

- (i) Perennial, such as sugarcane, plantains, gardenland, etc., require water all the year round—36 to 48 waterings.
- (li) Eight months' orops, such as superior class rice, ground-nut, chillies, onions, tobacco, and tur,
- require water from June to January-about 16 waterings.
- (iii) Monsoon dry crops, such as bajri, maize, dry rice, rala, require water from June to October—3 to 6 waterings.
- (iv) Rahi crops, such as jowari, wheat aed gram, require water from October to Jonnery—8 to 10 waterings.
- (v) Fodder requires water from January to June-10 to 15 waterings.

. .

Distribution is controlled by Departmental Agency, there being karkons employed one for overy 15 to 20 miles of canals, and nudor them Patkoris, one for from 5 to 10 miles, occording to the oxtent of irrigation onticipated; the whole being under the supervision of the subordinate in charge of the tark in charge of the tank.

The revenue is realized by the Civil Department on figures furnished to thom by the Public Works Depart-

3. The undersigned has had very little experience of tanks constructed in black-cotton soil. There are a number in the district, but all so small as to be more in the nature of pends than tanks, holding not more than 3 to 5 feet of water, and chiefly used for watering cattle, etc.

So for as undersigned can offer an opinion, it is that high earthen dams cannot be constructed of black-cotton soil alone, and even with masonry core walls, would not be likely to prove satisfactory.

In black soil there is no demand for water, except in cases of prolonged drought, and in cases where a large area of such soil is under command, the revenue is more precarious than in eases of tonks commanding other classes of

So far as undersigned is aware there has been no desire shown for irrigation works on the part of owners of black Roil.

4. Descriptions of existing Government irrigation works and their tofol annual irrigating opacity have been farnished to the Superintending Engineer on special duty, and will, coubiless, he furnished to the Commission by that officer.

In the cases of all four of the tanks in operation in this district, vie., Mhasvad, Ekrak, Ashti and Koregaen, it cannot be said that they can be depended on in a season of drought, as during last year very little irrigation was possible from any of them (compared with what they should be capable of) on account of short storage of water.

- 5. Cannot answer.
- G. Connot answer.
- 7. Connot answer. The Collector will probable to ablo to give this information. In the epinioniof the andorsigned, it is most desirable to stimulate the construction of new wolls in every possible way.
  - S. Cannot answer.
  - 9. Relief labour was employed on-
    - (i) Improvements to reads and metal-breaking.
    - (ii) Railways, earth-work and ballast-breaking.
    - (iii) Large irrigation works.

The amounts expended on each class will be intimated Actor

Of the incompleted large irrigation works, the undersigned considers that it is most desirable to complete Pathri and Wadshivna tonks at once : the estimated cost of these is—

•	•			Rs.
Pathri		•	٠,	1,22,000
Wadshirma				40.000

The following sams have been already speat on those two

				Rs.
Pathri		•		8,29,000
Wadahiyna	•	•	•	1,71,000

and so long as they remain incomplete, no benefit is obtained from this large expenditure, and the work already done must deteriorate very considerably.

If completed, it is probable that these works would Mr. B. P. mitigate the effects of any future famine in their immediate vicinity, and in the case of Pathri, it would also render possible a permanent water-supply to Barsi town, where the present supply is, at times, very far from adequate.

Moreover, the work romaining to be done on these two tanks is, most of it, not suitable for the employment of fomine labour, it being, for the most part, the completion of outlets, capals, etc.

The sums mentioned above as having been spont on and being required to complete Pathri and Wadshivna tanks, show the vulue of the work at normal rates.

12. (i) and (ii). Information on these points from 1891-92 has already been furnished to the Superintending Engineer on special daty, and he will, no doubt, sapply it to the Commission. A statement, so far as information is evalleble, for years previous to 1891-92, accompanies for works now in operation.

13. The scale of water-rates is as follows :-

		Uh t	iol ank			kro			ihi ink			rcg no k	1011
		R	۵,	p.	R	۵,	p.	2	a.	p.	R,	6.	p.
Perencial crops	•	12	0	0	10	0	0	12	0	0	٥	0	0
Eight months' crops		4	0	0	4	0	0	4	Ô	0	2	ð	0
Rabi crops		2	0	0	2	9	0	2	0	0	2	Ð	0
Monsoon dry crops		0	12	0	1	0	0	0	12	0	2	0	Ð
Hot weather crops		0	0	0	ß	0	0	4	0	0	2	ð	0

Applications for woter are received annually for porennial crops, and for others, during their seasons. Applications are entertained in order of receipt, so long as woter is avail-

In years of favourable rainfell the demand for irrigation, and, it also follows, irrigation revonne, falls off very con siderably, and the effect on the following year depends ontirely on the mensoon intervening.

Tanks are not, by any means, always empty at the end of the irrigoting season.

Undersigned finds it diffioult to orrive at a conclusion as to whether irrigation works got a fair credit for the increase of revenue due to their construction, for there are so many indirect advantages that dwellers in the violaity enjoy; but on the whole he is mable to show that they do not

Charges for maintenance ond establishment are quite foir; no one is employed on snything but the tank concerned.

The question as to whether the Rovenno Accounts may be accepted as correctly indicating the financial results nttained by each work, depends, to some extent, on whether each work is considered to get a fair credit for the increase of revenue due to its construction: if it is thought that this is the case, the Revenue Accounts may be accepted as correctly indicating the finencial results attoined,

14. Undersigned is of opinion that three, at least, of the irrigation tanks in this district (he has no knowledge of Koregaan) did, to a considerable degree, mitigate the offects of the recent famine in their violatry. As to the other points embraced in this question, the Collector of the district is in a better position to roply than the undersigned.

In conclusion, undersigned would beg to state that his experience of irrigation works is so very limited, that he ventures to suggest that the Commission will kindly bear that fact in mind whon considering his memoranda.

Milsom

Mr. Il Il. Milion

Mr.Gokhale. (6) Mr. Nilkante Govind Gonhale, Retired Assistant Engineer, 1st Grade, Irrigation Department.

T

#### Answers to printed questions.

#### A .- GENERAL.

1.—The Decan districts and Gnjarát, Poona, Satára, Nagar and Násik, Sholspuz, Khándesh and Belganm. I was in charge of some of the principal irrigation works in the districts named above. I aurveyed come, constructed and managed others, especially the Krishna canal works from the beginning to the and; Chikhli canals; Mhasad tank canal No. 2; Mayani tank and canal; Yerala water works; Ner tonk; Mutha canals (Ponna); Lakb and Ozar canals (Nagar and Násik); Ikruk tank nod canal (Sholspar); Jamda canal; Hartala tonk and umal (Khándesh); Hatmati canal (Gujarát); and other old petty channels. I have also inspected the Ganges canal and the Káveri canals and compared the existing systems of irrigation in those provinces with that which systems of irrigation in those provinces with that which obtaine here

- 3.-(1) Yes. On an average the labour of three porsons per aere is available under command of the Krishna canal (Satara district), while the labour of only one man is available for 26 acres on the Lakh and Ozar canals (Nagar and Násik districts).
- (2) Yes. There is an insufficient supply of cattle for want of grazing land free of charge or at a moderate rate. When there were no stringent rules of the Forest Department, people had large numbers of cattle, but since then the number is reduced to a minimum.
- (3) Yes. Inadequate supply of cattle has naturally cortailed the scores of manure. Even bones are experted.
- (4) Yes, to a certain extent; but this can be partly remedied by an abundant supply of manuro in black cotton
- (5) Yes, very great obstoole: for crops fail and people are rained doubly. They lose their seed end labour and there is no prospect of a erop. By too late commencement there is an antimely outply of water, which only becefits late crops. Too carly occasion is also ruinoos, but it can be partly remedied by a profuse use of cowdung and osh
- (6) Yes, it is. In the first place, the cultivators are too poor to opend. In the second place, if some of them have money, they are afraid of spending it for fear of enhancement of water-rate and also land assessment. Some may have funds to spend on expensive cultivation of irrigated crops, but they are afraid of the uncertainty of timely and sufficient water-supply. Also they fear that the return they expect is not proportionate to the fitful enhancement of rates, which they anticipate on account of the nucer-tainty of land tenure. They, therefore, naturally wish for a permanent settlement.
- (7) Yes, quito so. They heartily wish for a permanent
- (8) Yee. Uncertainty of tonnro discourages coltivators to spond large some of money on land improvement.
- (9) Poverty, wont of oredit with the Sawkars, ignorance, no improvement in the est old methods of irri-gntion, the rough conservatism, want of proper scientific directions by Government or poblic hodien or experts as regards varieties of manore appropriate to different crops.

#### 4.-No such exemption, as far as I am aware.

5.—As far as I am mare people do not largely take advantage of this loan for improving their lands for the following reasons:—They complain that they do not actually get the exact amount advanced and against the heavy rate of interest. Sometimes it impress that the advance made goes to recover arrears of land revenue. The terms on which the meacy is advanced are bord. The inte offered on promissory notes may be charged on the advance made. I would like to recommend one or more of the requedies pointed out in the question as individual cases. remedies pointed out in the question as individual cases permit.

6.—No case has some to my knowledge. Yes. There is a atrong desire to have irrigation extended. It is growing stronger and etronger on account of the unequal distribution of the rain and increase of population.

#### B .- CANALS OF CONTINUOUS FLOW.

It is true. Two crops instead of one rich crop, but they are of inferior kind and the laboor required is therefore greater. Hence there is no appreciable increase in the value of the produce of the

- (2) The answer is the same as for (1).
- (3) (a). If there is timely and ample rainfall, artificial irrigation does not increase the value of the yield. It is in that case absolutely superfluous.
- (3) (b). Yes. It is necessary even for a normal yield, and on necount of the failure of crops in unirrigated lands the value of the yield of irrigated lands is necessarily increased.
  - (3) (c) Much more so in the case of droughts.
- 8.-(1) The increase is in proportion to the difference between the value of indifferent crop and foll erop and vaties according to the market rates on the demand and sapply principle.
- (2) There is almost no irrigation in the Decean in a year of drought, nuless the canals are provided with supplementary reservoirs.
- -9.-(3) The rate per acre varies according to local circumstauces.

11.—Yes, damage results to both people and soil. By irrigation without manure the soil is epoiled, the salta occing out. By too profuse irrigation it is spoiled by anturation. By too extensive irrigation damage results on account of the inability of the cultivator to bestow on his land adequate labour and mesonra. By too frequent irrigation the soil deteriorates for want of a sufficient empty of manure. From water-laysing the salts in the soil come up manure. From woter-lagging the calts in the soil come up nund sale efforescence damages crops and soil. This can be remedied by proper drainags. The extent of the damage depends on the local circumstances. Inadequacy or excess of any one particular thing is sufficient to damage the crops and spoil the land. The Krishna canal irrigation is of over 20 years' standing, and the svil stood for nearly years or more until it was minimised by drainage; and this I say from my own personal experience of the Krishna canal, the Mutha canal and the Gokák canal.

#### C .- CANALS OF INTERMITTENT FLOW.

15.—Well-irrigation is taken advantogo of only during the periodical cosmion of water from the canal. This is absolutely necessary to save crops when the cosmion extends over a number of days.

21.—As far as I am aware no private persons have constructed hig canois, nor are they allowed to do so by Government.

22.—Yes. This could best be done by encouringing private capitalists under cortain guarantees as in the case of certain Italiway Companies. When the capital so invested is paid off with interest at a fixed rate, the property in the cause must lapse to Government, the difference between the present revenue to Government from unirrigated land and the revenue after irrigation being paid to defray the enrrent expenses and those of construction,

#### D. - TANKS.

#### 24 to 32.—There is no appreciable difference.

33.-There is some inconvanience in as much as no water can be stored up for enlitivation on one hand, but, on the other, nilovial soil is some gain, though with a small reduction in area. The silt is not removed by dredging or otherwise; as, for instance, the Katraj tank (Poona) and many n tank in the Madras Prosidency and Mysore. No a steps seem to have been taken anywhore to remove the silt. It can be economically romoved by famine labour.

34.-In the Decean generally-

- (1) The average depth of wells is from 16 to 40 feet. .
- (2) The natural sopply is from spriogs and they are fed by percolation.

In ordinary years it does not fail or become so much saline as to be useless for oultivating crops, e.g., chilli crop which yields better crop by saline water.

- (3) That depends on the nature of the ground; generally it requires Rs. 500.
- (4) Permanent. It, however, vories according to the
- (5) By a mot—a large leather bag holding about four to six cubic feet of water, or a Persian while or seconing.
  - (6) Two to five acres according to local facilities.
  - (7) Two to five ocres.

. 37—(2) From annes 8 to Rs. 4½ per acre over the assessment for a jurnit acre fixed by Survey Sottlement necording to the capacity of the well. The rates are paid on the arch attached to and commanded by the well.

38.—(1) .Yes. There are professional men called Pánabude, who pretend to know the under-corrects of water. No boring is taken, and many people have therefore to lose labour and money spent on a well.

39.—(2) Difficulty of finding monoy. None that I am aware of. Gratuitous help is never given. Free use of tools and implements with free labour is the only inducement to make it successful, and when successful a certain percentage of the total cost may be borne by the collivator.

· 11.

Supplementary Memorandum of Evidence to be given before the Irrigation Commission.

Large works like the Mutha canals have done great good, but much water is lost by perceletion from the carals; and it can he picked up with great sdvantage. I have suggested such pickup-weirs, large and small, when opportunities occurred for so doing while in service. I suggested, for instance, a pickup-weir for using the waste water from the Gokák Mills in my report at the close of my service. The water-supply to the Gokák Mills runs waste, and it is so great that a canal may be maintained out of it. A

pickup-weir below Mhaswad Canal No. 2 was also suggested. A small pickup-weir to divert wntor from n Nnlla in Vadgacu Budruk into Mutha Canul was suggested. Small pickup-weirs on Vithalwddi Nulla and Nana Sankarshet Nulla below Mutha right bank canel were constructed, and so much water was saved. I recommend that pickup-weirs, wherever possible, may be constructed on the system of Khandesh Class II Irrigation Works. The works can be entrusted to village communities, and the maintenence charges would be small. I now suggest a pickup-weir on the Mula Mutha River. There is already a weir constructed for the Bund Gardon, and it can be utilized for making a left bank conal from the weir.

2. I also recommend the construction of small tanks, not so much for irrigation direct but for feeding wells, by increasing the underground supply. I was in charge of the Islampur water-supply tank. In addition to the direct use it serves, it has made the supply of wells below it unfailing, and people are greatly benefited. I recommend, therefore, that small tanks, wherever possible, be constructed, as they will give useful work for famine labour near the homes of famine-stricken people, and be a permanent benefit to the country.

3. My experience is that the sofficiency of water in the Krishna canal largely depends on the rainfall at Mobdbaleshwar. Whenever there is 300 inches or more of minfall there the supply is ample, but when it is less the supply is proportionately reduced. A storage tank, therefore, will improve the prospects of the canal which are already good.

(7) MR. NABATAN VENEATESH CHANDAVAREAR, Mdmletder of Bedemi, Bijapur District.

Answers to printed questions.

1

#### A .- GENTEAL.

- 1. The following answers refer to Hijapur district and I have answered them from my experience as a Mambatdar.
- 2. The average roinfall in each moath of the years 1900 and 1901 is given in the following statement:-

Statement showing the average rainfall in each month of the years 1900 and 1901, Taluka Badami, District Bijapur;

Years	,	- January.	February.	April.	May.	July.
1900 .		0·0 0·02	0 0 0 0 0 0 1 0 0 1 0 1 0 1 0 1 0 1 0 1	0-60 0-77	1·73 3 · 2·57 3	48 2·61 01 053
Yeara.	Angust.	September.	October.	November.	Desember.	Torat.
1900 1901	1·34 0·73	4·60 0·78	2·67 2·97	0.0	00	17:30

- 3. There is obstacle to the extension of irrigation arising from—
  - (3) insufficient supply of manure. The only manure now used is of cowdung. The ryote are not allowed to get leaves from forcets, besides there are no trees in the forcests, the leaves of which can be used;
  - (4) unsuitability of soil (black cotton soil) to irrigation, as the water of the tanks in such soil is likely to seak in;
  - (5) nnoertainty of the supply of water no the rainfall is very uncertain, and hesides this, there is no cortainty of finding water in the wells, if dug ont. The water is found in a well to p

depth of from 40 to 60 feet, and much exrense and labour to get the water for irriga- Chandarartion is required;

- (6) lock of capital for the initial expenditure or of funds for the more expensive cultivation of irrigated crops. There are very few among entitivating class in a position to spend a large nmount for this purpose. The other well-todo persons outlay their capital on interest, etc.
- There is no obstacle arising from (2) insufficient supply of cattle suited to the cultivation of irrigated land as they can be got in the district;
- (7) fear of enhanced rent or revenue assessment.

  Generally no amount is spent by the tenant on the lands belonging to the owners. The owners of the lands get a fair amount of produce from the lands irrigated to pay off the assessment even if enhanced.
- (8) uncertainty of tonnre. Up to the passing of the Land Revenne Code Amendment Act the occupants of lands did not think of the uncertainty of tenure as they knew that the lands were allowed to continue in their possession for ever, although the assessment is liable to be altered after a period of 30 years; but I think the occupents would heatate to spend on this account, as there is no gnarantes under the Land Revenne Code Amendment Act that the lands onea forfeited would be restored to them without fail and to no one olee.
- 4. No enhanced assessment for lands irrigated subsequent to the original Enrey Settlement is levied up to the expiration of the term of Settlement (30 years). Generally no tenants spend anything at their own cost for lands leased to them by the owners. The existing provisions in respect of usussement are not sufficiently liberal. I would respect fully suggest that if the lands not formerly irrigated are once assessed, they should not be liable to any enhanced assessment if they are irrigated at the cost of the occupants.
- 5. Loans under the Land Improvement Act nre not freely taken by the people for the extension of irrigation, as there is no certainty of water being found in wells and generally the black soll is not suited for tanks and the rainfall is nacertain.
- (1) The reduction of the rate of interest and (2) remission of the interest would not encourage the ryots to obtain

Mr. Gokhale.

Mr. Chandavarkar.

tagái loans for soch purposes. (3) Partial rombsion of the advance and alec (5) extension of the period of repayment (both in one and the same case) and (4) total remission in case of failure would, to some exent, encourage the ryots to obtain loans.

6. It is true that the ryots are sure and certain that they would get a fair portion of produce in the fields to be irrigated even if there is no rain. Still I do not think that the extension of irrigation would tend to injure the remaining collivation by attracting its oultivators to the injured tracts. irrigated tracts.

The rainfall in this district is very uncertain and there are very few wolls or tanks having natural springs, and the water-supply is thoroby scenty and consequently the people desire to here means of irrigation extended at the cost of

I would further soggest for encouraging the ryats to oteln tagái loans that if lands are farfeited under the Land Rovenne Codo Amondment Act, there should be a graroutee that they should he restored to the owners of the land without fail and to no one clse.

#### D.-TANKS.

23. There are some tanks in the Badami Talnka; the names are given below :-

- (1) (a) Halo Mahakooto Houd in Gowanki village.
  - (b) Arakeri in Nilgond village.
  - (c) Banshankri Houda in the village of Cholachgud.
  - These tanks have natural springs of water.
  - } in the village of Tim-(d) 1. Dodakori 2. Sannakeri
  - (c) 1. Irawakori 2. Gonjikeri in Khanapur village.
  - (f) Tank in the village of Kendur.

These tooks are filled up with water during mouseon, het have no natural eprings.

- (2) Government have fixed certain rules for regu-lating the water-supply that each khâtedar should take a certain quentity of water for a certain period.
- (3) The tanks which have natural springs of water e takes when nevo natural springs of water oupply water to the leads under their com-mand all round the year in a year of amplo rainfall, in a year of ecanty rainfall and also in a year of drought.
- The tanks in the villages of Khanapur and Kendur emply water for a period of uine months in a year of ample minfall, four months in a year of scanty rainfall, and in a year of drought the water is not sufficient even for one barvest.

The tanks in the village of Timesgar supply water far a period of nearly four months only in a year of umplo rainfall.

(4) The area irrigated from each of the touks is given helow :-

			Arra.		Assersmen		ıt,
			٨.	G.	Rs.	a.	p.
(a) Hale Mahakoote	Hon	d	14	16	98	0	6
(b) Nilgand Arkeri			3	15	11	1	0
(c) Cholachgud Bana	shanl	kri					
Houd .		•	40	14	295	12	0
(d) Timesgar—							
Dodakeri			7	214	295	12	0
Sannakori			84	39	91	9	11
(e) Khanapur-				ŧ			
Iranakeri			82	2.	353	9	0
Gnnjikeri			44	19	136	0	0
(f) Kendurkeri	•	•	256	16	1,436	13	6

26. The irrigation is not ordinarily supplemented by irrigation from wells given to the same land

- 28. (1) There are no canale owned by private persons.
- (2) The average annual rate per acre paid on account of irrigation to the owner of the land by the tenant is double the produce generally to be got in fields not irrigated.

- (3) Generally the highest rate per acre far Khuski land is Rs. 1-4-0. It will be seen at what rats the owners of the lands are required to pay to Government in the form of cahancement of revenue, etc., from the amount of resessment given against the area irrigated and shown in purgraph 23 (4).
- 29. When lands are leased out to a tenant, it is generally decided that the tenant shauld spend any amount that would be required to bring the water to the field or to prepare that loud for irrigation. The expenditure in this connection is very small, as no channels to flow water are constructed with atones, etc. This sort of labour is taken into consideration in fixing the amount of rent.
- 30. The maintennace is generally done by the Public Works Department. The approximate amount of cost per aero irrigated cannot he given, as there are no records. Every year such repairs, etc., are not executed by the Public Warks Department.
- 31. There are no tanks constructed by private persons in
- 32. I do not consider it advisable to encourage and assist the construction by private persons of further tanks, as there is no certainty of woter being found, and the ryots would not undertake to construct such big works.

#### E .- WELLS.

- 31. (1) The average depth of permanent wells is from 40 tn 60 feet.
- (21 There are very few wells having natural springs in this part of the district. The water, if found in a well, is brackish and is not at all cultable for irrigation.
- (3) The average cost of construction is from Bs. 1,000 to Rs. 4,000.
- (4) The average duration of a well is for a period of 20 or 25 years. Subsequently the construction work will have to be repaired.
- (5) The water is generally raised by the assistance of cettle. A leather bag containing some 4 or 5 gallons of water is prepared instead of ghada and is used for drawing water from the wells.
- (6) and (7) The average area insignted is nearly 8 acres
- 37. The average annual rate per acte paid on account of irrigation is Rs. 2-3-0 on account of gardees by the owner to Government, and Rs. 10 to the owner by the tenant. No paddy or jowari crops, etc., are raised here by irrigation from wells. The only produce reliable is raised by the use of water from wells is vegetables and sugercane, etc.
- (2) Nothing is paid to Government by the owner in the shope of enhancement of revenue if wells are dog out after the original Survey Settlement is introduced till the settlement period is over

These rates are paid on the area actually irrigated by the tenonis to the owners and by the owners to Government on the total area commanded by the well.

39. Serious difficulties are often encountered in the selec-39. Serious dimenties are often encountered in the selec-tion of spots in which a supply of water will be found; but none in the actual construction of the wells. I have not seen my instances in which assistance was affered by Government ar local bodies in the shape of expert advice. In some places there are experts who celect sites where water can be found, and their advice is generally acted up. It is can be tound, and their active is generally acted up. It is advisable to have a supply of boring tools in the centro of a district or in some convenient place for the use of the ryots of two or three talukas. The ryots who desire to make use of them should be given them free of charge.

39. I am not in favour of the construction by Government of wells in lond which is private property. To irrigate lands from the use of water from wells requires a large expenditure constantly to be incurred. This is not possible for most of the ryots to incur, and consequently the ryots would not like to have them in their fields.

40. The temporary wells are not used in this part of the district, and in a year of scanty minfall they will be of no neo for irrigation purposes.

It is most difficult to find out water in temporary wells enflicient even for drinking purposes.

3. If small tanks be constructed in hard black soil and not in soft black soil, water will hold in them, as water in such soil does not generally submerge; but earthen dams without mosoury core will be of no use, as black soil is easily washed away by heory fall of min. There is no demand for water during seasons of overage minfall, but only in case of prolonged dronght; but in cases of gardens, even in rainy season, there is always demand for water. The red soil requires constant rain or water from tanks, but in the case of black soil—if there has been once sufficient meiature to a depth of one and a half feet -no water from tank is required.

There are two tanks which irrigate black soil in the village of Timségar, but no water-rate is levied, os the use of water was taken into consideration when fixing the assessment on lands to be irrigated, and therefore it cannot be said that the irrigoted orea shows a falling-off in Jears of good rainfell and the revenue is precatious.

In this district the rainfull is very necertain, and consequently the owners of black soll would like irrigation works, and the construction of irrigation tanks for black soil is considered as remunerative as the crops in black soil grow more than those in red soil, and the produce such as rabi, jowari, cutton, etc., is sold at a higher rate than that in red seil.

7. I doubt very much whether the rrots would like to construct now wells by the use of tagai advances for irrigaling their fields, as wells require a very large amount in

this part of the district; besides it is not certain that they would succeed in getting water. Only few ryots who are Chandanar-well-to-do would like to construct wells eafely for the har.

purpose of gardens.

There ere some wells in some villages of this talka, the water of which is safely used for gardons. There was no scarolty of water in these wells during femine years of 1899—1901.

During the years 1899-1901 email same of Rs. 75 and Rs. 90 were granted for deepsning the wells, and the owners of the wells got a foir quantity of water.

Generally water in wells is found to a depth of 50 to 60 feet, and to dig out n well that would irrigate some 8 acres would require from Rs. 2,000 to Rs. 4,000.

- 8. In this taluka there are ue instances in which lande or crops ore injored by woter-logging, and no drainage worke ore required.
  - 10. I have no remark to offer.
- 14. No irrigation works were constructed during the famine of 1897 and subsequently. The famine relief works found necessary in the form of employment on relief works for those who con work, and of gratuitous relief for those who are unable to do any sort of work.

#### (8) Mr. R.-M. KENPEDY, I.C.S., Acting Commissioner, Sonthern Division.

#### Memorandum by Witness.

As the Commission has now arrived in the Southern Division, I have the honour to submit a short note on the needs of this division.

- 2. As I have received charge in the middle of November after an absence from India of 18 months, I am nuablo to speak from personal experience.
- 3. Belgaum District .- The areas liable to famino ·here aro-

The Athni taluka, the Gokek taluka excepting the pertion under Canal Irrigation, and the Parasad tainka including the Margod Petha.

To irrigate the above areas as a protectivo measure I would suggest as follows--

Athniand Gakik talukm (1) The present Gokak Canal may be extended towards Athnita meet the Krishna river to the

north, and (2) a rouel may be constructed from the Krishno so as to serve the eastern and northern villages of Atlank.

Bijapur District .- The whole of the district is liable to drought. The following works are suggested.

. The Sangogi tank under construction may be completed

For Ind and Sinds: the which will sorve parts of the Indiand Sinds: talkas.

The Buttary value which will sorve parts of the Indiand Sinds: talkas.

The Hulber tank under construction may be completed. For Bagawadt täluka (in part).

A canal may be constructed from the Krishna in the Bilgi For parts of Bilgt Peiha, Bijapur, Bagewall, Bagalkot and Muddebihal Makas.

Petha. For Padimt Hungand and Bagalkot talukse in part. A canal may be constructed from the Malaprabha river in the Norgand Petha of the Dharwar district.

Dharwar District .- The major portion of this district is ordinarily immane from famine. The parts liable are the Navalgund talaka Including the Nargand Petha, the Gadag taluka including the Mondargi Petha and the Ran

A canal constructed from the Malaprabha river Mr. R. M. in the Nargand Petha will serve the Petha itself, and Kennedy. parts of the Navelgund and Ron talakas.

I would recommend also the putting in thorough repair of all the existing tanks in this district.

I have italicised the works I consider most necessary.

- 4. Unless it is known what enms can be made available both in lump and annually it is impossible to recommend definite proposuls. Moreover, I am not aware that any definito schemes have been propared except that for Sangogi
- 5. On the Sangogl tank Rs. 2,44,000 hove been expended. The estinate provides for an expenditure of 12 lakhs.
- 6. Personally I would odvocate canal irrigation in preference to tank irrigation. It is true that generally there is some van, though owing to its being unscassemable there is scarcity, but searcity is generally accompanied by drought and ia the Bijápur district the total ramfall is often very insufficient. Under these circumstances tanks may fall when they are most wanted. Rivers, however, being dependent on the rainfall at the watershed where rain is alreast durays plantiful are not liable to where rain is almost always plentiful are not liable to dopletion.
- 7. Unfortunately the soil of most of the affected area is black soil which, as far as I have observed, is less suitable for irrigotion purposes.
- 8. Canol irrigation is, howover, successful in the neighbonring Satara district (in the case of the Krishna Cauel), and I am hopeful of good results in the Athni and Gokak tulnkas of Belgaum.
- 9. I doubt, however, the success of irritation works financially. The existing water-rates cannot, I fear, bear onhancement and to culture them would to make them unpopular. They would not, however, cause much loss ultimately, and that loss would be more than covered by the inercased prosperity of the people by partial protection from recurrent fommo.

## (1) Mr. G. L. MacGregor, I.O.S., Assistant Collector, Kanara.

#### Answers to printed questions.

- A. 1. (i) To the whole of North Kanara.
- (ii) I have had one year's tour in each division.
- 8. (1) The population is very sparse indeed except on the coast and on the Dharwar Mysoro hurder.
- (2) The cattle are of a vory small breed. Whore "weingan" rice is grown in heavy soil they use buffelors. In these cases the faud is flooded and then ploughed while under water.
- (3) Leaf manner is plentiful; owing to the comparatively small nambor of cuttle rich phosphates are not obtainable for any increase of cultivation.
- (4) The sell is sufficiently spitable.
- (5) The south-west mensoon is the only roul rainy Mac Gregor. senson; a few honey showers, however, fall in late April and early May. The rainy months are June to September. Latterly there has been a follure of rain in September.
- (6) All the cultivators are poor. The capitalists are few and none of them take the smallest interest in the improvement of agriculture. I do not think expense is any drawback. I fancy there ore few more expensive cultivations than gardon crops, ond .everybody is reody and anxious to turn his riceland into garden.
  - (7) I have not heard of such foar.

Mr. G. L.

Mr. G. L. MacGregor.

- (8) The tenant law ond tennre are all right.
- (9) The remain taw out termine and right:

  (9) The main objection to the extension of irrigation is the extent of jaugle. Very nearly all available land—except in the melarious ottip near the west of the ghuts io under cultivation and most of it under rice, an irrigated crop. The soft is not, I think, rich oneagh to grow anything else. On the stony hills "regi" is sometimes grown, but such land would not be suitable to irrigation and ragi is a dry crop.

#### I-BELOW GHATS.

5. Leans are generally taken by the people who live on the coast and principally for excluding water from their lands. A few wells are sank with the help of tagāi in the larger towns for the growth of mengo, jack, and coconnut trees in the gardens of the larger houses.

Tagui dishursed does not exceed Rs. 20,000 a year if it reaches that figure. The reasons are—

- (i) The ignorance and backwardness of the people which provents their doing unything which their forefathers did not do.
- (ii) The nutural water-supply is so extraordinarily good that irrigation is not in demand. The people draw and deflect the monatain streams on the coast at very little expense.

#### II-ABOVE GHATS.

In Haliyul and Muudgod the reasone irrigation is not extended are:-

- (i) The poverty of the people and the upathy of the Sawakar.
- (ii) I do not think many other sites are uvailable for tasks and there are no rivers to tap. I do not know the depth of the subseil water from the surface of the ground.
- (iii) As a rule, in each village there is one tank which irrigates some of the lunds, perhaps 80 acres on the average. These lands are in the hands of many holders. To improve the tank would benefit more than one holder and the cost more than a single holder will undertake. There are no philanthrophiets to undertake this work, and there is great difficulty in getting the people to take takevi on command guarantee. I do not know if it has been tried extensively, but I know of one case on the coast where matters came to a deadlock. If you go to a Huliyal or Mundgod village, they will ask you to improve their tanke, hot I do not think many villages will take takavi for it, as they seem to be under the impression that Government ought to do it. The Public Works Department if they have funds repair tanks where the people coatribute is of the cost, but it is difficult even to get them to do that much.

#### REMEDIES.

Nothing short of partial romission of the advance, say, 20 per ceat., will be of any use.

- 6. There is so little artificial irrigation in this district that its effect is inappreciable. I should say no. The people who live in the village cling so tensciously to their homes that they rarely go away even when the village is over-populated for the area under cultivation.
- B 7.—There are no cause of continuous flow in North Kanara.
- C 12 .- This form of irrigation is confined to the hilly tracks.
- (1) and (2). The dams are thrown acrose little mountain streums. A little trench is then dug which is led along the top of the field and the water is distributed on to the land from this by holes made in the banks.
- (3) The empty is generally maintained, I believe, for about 8 or 4 months. Laterice is invariably grown with this water and is generally planted in December. When the rainfall is low as in 1899 no lete rice is attempted to be grown. Actual drought is unknown.
- 13. (1) It is rurely that 2 crops are grown on the land. On the coast a second crop of vegetable is sometimes grown

in a patch, but not with irrigation and from streams but from holes sunk in the sand.

- (2) Rice and angarcane only are grown with irrigation.
- (3) Rice only heing grown, and as it will not grow without water, the field is not appreciably increased.
- 14. When the rainfall is unfavourable the villagers do not uttempt to grow any late crop rice. The monsoon is generally sufficient for the early crop.
  - 15. The irrigation is not supplemented by wells.
- 16. I cancot give any estimate and I doubt if thore is eny increuse.
  - 17. There is no rate paid for irrigation from streams.
- 18. The annual expenditare is trifling, not more, I should say, than Rs. 10 for each stream which will irrigate 30 acres. The actaal expense is nil, as the wood is applied free by the Forest Department and the only cost is the labour. This is generally borne by the tenant. He has no seemity and needs none.
  - 19. I cannot answer this question.
  - 20-22. Those perhaps do not upply to this district.

#### D.-TANKS.

- 28. These are found in the east of Haliyal, Sirei and Siddapur talnkas and the Mundgod Petha.
- (1) The tank is generally the head of a slight depression in the ground which is hundred up The extenment area is only a few acres.
- (2) The bund has a slaies from which the water is distributed over the uppermost levels; it flows down to the lower etretches from holes in the terraces.
- (3) (a) In a year of ample minfall the supply is maintained till the middle of April. Some of the larger tanks never dry up.
- (b) When the rainfall is scanty the tanks dry up in February.
  - (c) An actual drought has never occurred.
  - (4) The area irrigated will wary from 10 to 100 acres.
- 24. (1) The tanka that I have seen do not last long enough to grow a second crop. I have never seen a second crop. I have not seen the Mavinkop tank.
- (2) It increases the yield in a year of scanty rainfull only by admitting cultivotion of the higher lands. I have never seen them in a year of drought or of ample rainfall.
- 25. I do not know about the too late commencement of the rain, which generally commences pretty regularly. Early cessation of the rainfall means that only the low-lying terraces get onflicient water, as the tank is only an assistance to rainfall and much crop is grown above the reach of, the tank water.
- 26. No. When the tank race dry pits are dug in the bed of it, bat not for irrigational purposes.
- 27-29. I caunot answer these questions.
- 30. Nothing in the way of conservancy is due that I know of.
- 31. Private persons only construct little tanks to irrigate their own field or fields.
  - 32. I do not think there are many available sites.
- 33. The tanks frequently get choked with silt und weeds. In the hot weather when the tank dries up 'the people very occasionally usk district officere to remore it. "Repairing a tank" generally coasists of thie. If the Patel, which is rarely the case, is an infloential man, he persuades the villegers to do the work themselves.

#### E.-WELLS.

Wells are not used for irrigation except for the small palm and froit gardens in the compounds of houses. Heles are occasionally due in the beds of streams and water raised to the crop on the bank by means of a counterpoise. The average cost of construction is merely the labour involved, are of li wood, etc., is supplied free. They are not in general use except on the coast.

Note on the extension of Irrigation from the Malag tank, Dharwar Collectorate, Bombay Presidency.

The Madag tank is situated on the southern border of the Dharmar Collectorate of the Bombay Presidency and it in Mysere territory, the frontier passing over the centre of the tank dam.

#### Situation .- 75°27' East, 14°21' North.

- 2. The dam was constructed, it is believed, some three canturies ago, but, apparently, shortly after its conctruction the low enddle between two hills which was apparently need as a wiste-weir scoured out, rendering the dam, which is about 150 feet high and 1,300 feet bed width, practically needes.
- 3. The waters of this tank were not used till 1870-71. An ontiet through the dam and also the right and left bank canals were constructed during the years 1861 to 1867.
- 4. Mr. Joyner in 1886 submitted three alternative projects for raising the water level of the tank by 54 feet, 49 feet and a slightly increased level than at present, respectively.
- 5. The first two projects are at present out of the question, as they would involve the submergence of 12,000 acres in Mysore or occurry a whole talaka, the compensation to be paid for acquiring this site would amount to between Rs. 13,00,000 and 14,00,000 and the Mysore Government have refused to part with the land. The only possible extension is, therefore, on the lines of the smallest project and the following information is in apport of the advisability of a detailed survey being undertaken.
- 6. The discharges gauged in the river below the maste-weir from the year 1869 to 1893 chew that there is practically a continuous discharge of 100 ensecs available from June 20th till November 20th, in addition to the discharge drown off by the existing canals, which may be roughly taken at 15 casees, during the above period, though at times the canals are closed when there is no demand for water.
- 7. Table showing records of 25 years gauging of 100 cueses or over flowing to waste.

(Each month is divided into three periods of approximately ten days).

pictory tox			_		
	Mosth.			Period,	Namber of years to which 100 curees or over her been recorded during whole period tu 25 years.

Ostober	•		. {	Ist 2nd 3rd	24 22 21
November	•	•	. {	1et 2nd 3rd	20-5; 19 14
December	•	• ,	.{	Ist 2nd 3rd	8 5·6 3·6

<sup>8.</sup> The period of cortain empty corresponds with the vice enlitivation season, and journ's is also grown during this period, but requires water aclote as the end of October, the supply in October being liable to curtailment in about three years out of 25.

- 9. The above is the case on the Dharma Canal situated near Hangal about 30 miles to the north-west, and this canal is situated in a wetter zone and cultivates nothing but rice, and a faw garden (fruit trees, coconnuts, etc.) lands. This canal is entirely successful, and is about 19 miles long excluding branches.
- 10. After the year 1893 till the present day the discharges have not been gauged, but records show that the waste weir has flowed continuously from 20th June till 31st December with only one break of ten days in November and in another year the whole of December.
- 11. The average discharges worked out from 1872-1884 are as follows :-

	Mon	th.	Атстадо спясон.	Maximum un one day.	
May June July August September October November December	:	•		20 270 2,028 1,338 801 666 353 70	Cuscon. 323 6,651 44,376 8,752 5,731 4,948 4,947 358

- 12. The above averages are only for a period of 12 years, but they show that on the average, 250 cusees may be relied on from 20th June till the end of November, and as rice does not require much water in the early steges of its growth in this district (no rice is transplanted), 250 casees may safely be rolled upon as available for irrigation without any storage whatever, during the rice and javari sesson.
- 13. The existing canals cultivate the lands near the village of Masur which has a fairly heavy rainfall. It is possible to take the water much further, however, to a far drier area and the attached tables and charts\* illustrate this.
- 14. The months of heavy rainfall at Meaur are June, July and October, whilst at Ranibeaur it he heavy falls may be expected only in October. Ranibeaur is worst off during August, when there is the createst amount of water movible for irrigation. There is, therefore, a better chance of water being utilized regularly near Ranibeaur than at Mosor. The area at present outlivated near Masur by irrigation is about 800 neres, but there is a distinct tendency to increase this area in years of scanty rainfall, such as 1891 and 1899, in which the areas are the lergest and the rainfall the least during the last ten years.
- during the last ten years.

  15. The rainfall at Birckerur is given to show the rapid falling-off in rainfall outside the Masur Volley.
- 16. Hirekerur is only 7 miles to the north-west of Masur. The reinfall returns for Masur, Hirekerur and Ramibenur all show that there may be a total failure of ruinfall during any month of the year. The meaths of June and July being least liable to failure. Any extension of irrigation would, therefore, be useful as protestion against famine.
- 17. The left bank canal may be onlarged to carry 200 cusces as a normal full supply discharge with a margin of 1 to 2 feet over this as possible maximum ierel and extended to near Ranibsonr. The bydraulic gradient may be made 7 82" per mile which is two inches in excess of that of the Dherma Canel which gives no trouble from weeds or silt.
- 18. A survey to locate the line oud for the preparation of the estimate is necessary.
- 19. The above proposals can all be carried out without any increase on the storage of the tank, but to allow for a possible shortage or break during the monsoon and to give nu increased head to the Regulater at the head of the canal, it is desirable to approach the Mysore Government with a view to their permitting a modified form of Regulation: as indicated by the bar dotted line on the strached sheet.\*

  No. 3 showing curves of water level in the Mudag Tank above weir-creat.
- 20. The weste-weir is already provided with piers and alits for planks, but the British Government have never been allowed to insert the planks.

- Mr. H. B. 21. The Regulation proposed cannot possibly da my Shoubridge. harm to the landa that would be solvenged, because they are liable to a submergene- up till 15th November of as unch as 5 feet and only 1' 6" is asked for on that date, after which only 8'.
  - 22. The shove proposals would provide water sofficient at normal full supply level to irrigate 10,000 acres with a duty of 50 acres per ensec, which is not a high duty where rain falls to nn appreciable extent, whilst the canal could carry, when the water level was 2 feet over F. S. L., enough for 15, 000 nores.
- 23. The right bank canal would be retained as a perennial canal as at present, and ofter the 15th November it and the 1st six miles of the left hank canal would be alone entitled to draw on the storage of tha tank as long as the waste-weir was not flowing. The area under command is about 45,000 acres.
- 24. The proposal is wall worth the serious consideration of Government, and there is no reason why it should not sacceed us well as, if not better than, the Dhermin Canal which it is shortly proposed to remodel to irrigate 12,000

(11) Minutes of a Conference held with the Hon'ble Mr. J. Monteath, C.S.I., I.C.S., Member of Council, Bomboy, Poona, 30th December 1901.

#### PROVINCIALIZATION OF TREIGATION WORKS.

J. Monteath. teath, if you would give us the beneat of your opinian on the question of provincializing the Irrigation Works of this Presidency.

Mr. Monteath.—At present the only Provincial Work is the Gokak Canal which was made in connection with n mill contract with a private company. The Secretary of State ordered it to be so classed. Generally the object of provinalalizing is to provide a check on expenditure, but it does not exist in this cose, as everyhody wants to extend irrigation. I see no objection to provincializing irrigation works, nor do I see much advantage. The receipts from these works in the Presidency proper are small and are chally recovered as land revenue; the direct receipts are very small; the accounts are complicated, and provincializing small; the accounts are complicated, and provincilizing the works would save correspondence in this respect, and applications for sanction, etc. As to increasing the interest which the Local Government toke in the works, I do not think that is passible.

Mr. Higham.—Might you not found the receipts from the minor works so as to provide means for their improvement f

Mr. Monteath.—Not very well in Bombay; there are no no direct recepts from minor works. The water revenue is consolidated in the land revenue.

Sir Colin Moncrieff - Under the present arrangement he water rate is Imperial and the land rovenue Provincial. Might not the Province be given the whole of the water share of the laud revenue so as to increase its interest in the

Mr. Monicath.—If we get the water share—say four-fifths of the land revenue—it would perlups result in the tanks being maintained in a more efficient state, but I doubt if there would be any increase in laterest; our officers could not be more keen in the motter than they are nt present.

#### MAINTENANCE OF TANES AND SMALL ISBIGATION WOLKS.

Mr. Higham .- If the Govarnment of India were to give the money required for making small works, could the local Government undertake their maintenance if it got credit for all the increased lend revenue? At present it only gete one-fourth as its share.

Mr. Montcath .- I think the water share of the revenue would suffice to maintain the works. There is no difficulty as regards mointaining these small works; some are not worth maintaining and might he hunded over to the people to keep up or not as they choose.

Mr. Higham .- Would you first put them into an efficient state of repair ?

Mr. Monteath .- Not those which are not worth repairing; I would leave that to the people and generally reduce the assessment on land under them to dry rates, but in some onsess where the warks are to utilize at no great cost n natural advantage of water, I would make some charge for the water. No charge should ordinarily be made in the case of small tanks made by private individuals.

Mr. Higham.—You say that there is no difficulty as regards mointaining the works, but in the case of the selected works which are to be maintained by Government, the Local Government will got only one-fourth of the land revenue, and if it spends money on repairing the works, its interest in the returns an the expenditure will be noly one-fourth of the whole.

Mr. Monteath.—I meant that there would be no difficulty if we got the water share of the assessment, and I was speaking merely of the cost of maintonance. The Government of India would have to give the money required to put the works into a proper state in the first instance.

Mr. Ibbetson.-You said just naw, Mr. Monteath, that no sharge would be made for the water of small tanks made by private individuals. Is not a royally charged? I generally agree that the water in the property of Govern-ment and that a charge in feir; but is it, do you think, judicious to impose a charge in places like the Deceau, where it is desirable that all possible means should be taken to execute a individual. to encourage irrigation?

Mr. Monteath .- Much depends on circumstances ; there are cases in which the water advantage is exceedingly small and obtained at the cost of the cultivator, e.g., surface draining canglit by bands; in such axes I would not obarge. But I would not relinquish the charge nitogether; would, for instance, charge the people living on the hank of a running stream.

Mr. Ibbelson .- Even if the abolition of the charge would atimulate the use of the water?

Mr. Monteath .- It would hardly do that -- the chergo is Mr. Montath.—It would hardly do that.—the chergo is small as compared with the adventage. In many cases on running streams where the water advantage is considerable it is reasonable to make people pay; it would not be equitable to let them have for nothing so great on advantage over their neighbours; at the same time I would be exceedingly lenient and do everything possible to stimulate the use of the water.

Sir Colin Moncrioff.—What is your opinion, Mr. Moncoath, regarding the 10 per cent. contribution which the cultivators must agree to before their tank is repaired? I see that the Public Works Officers refer to the difficulty arising from this rule of repairing the tanks in groups.

Mr. Monicath .- Some officers have advised that it should not. ba abandance, as the offer of a coatribution is evidence

that there is a real desire for the water, but if a full assessment is charged oo account of the tank, it seems hardly right to aharge more. On the whole, I think that the rule . daes mere horm than good, and I would obelish it.

Mr. Ibbetson.—De you think that it would be possible to make the rayots carry ant tha petty repairs themselves?

Mr. Monteath .- I do not see how this could be enfarced; it would be difficult to fix the responsibility.

Mr. Ibbetson.—If the necessary powers were given to him by legislation, could not the Mamlatder orrange? This is done to a very large extent in the Punjab, where o man pays dauble the market value of the labour if he fails to carry out his share of the repairs.

Mr. Muir-Mackenzie.—On our Bundharas the people da carry out the repairs; each man has his allatted work; but much dapends on the individuality of the Civil Officer in getting the repoirs fally carried aut.

Mr. Monteath .- There would perhaps be no difficulty in proportioning each man's work according to his area—tho difficulty would be in enforcing the execution of his share of the work, which he woold probably contend was not a fair share owing to greater or less distance of his land from the tank, and such reasons.

#### SEPARATE ESTABLISHMENT FOR IRRIGATION WORKS.

Sir Colin Monerieff.—Whot is yaur opinion on the question of forming n separate Irrigation Department. During our tour in the Bombay Presidency we have been much struck by the fact that the superior officers of the Public Works Department have so much work of other kinds to nitend to that they have not sufficient time to attend to matters of irrigation.

Mr. Monteath.—If there were money enough to spend on works, no doubt it would be desirable talhave a separate branch for irrigation works.

Mr. Migham -- Every Province in which there is irrigation on any considerable scale has a separate Engineer and Secretary for irrigation.

Mr. Montenth .- The last three Public Works Secretaries in Bombay have come from Sind, where they gained special experience in irrigation.

#### PROTECTION AFFORDED BY ISBIDATION WORKS.

Sir Colin Monerieff.—Can you give us any idea of the extent of the protection offered by Irrigation works during the famine ?.

Mr. Monteath.—I hove seen great good dooe in famine time even by such irrigation as we have. In the arrly part of 1900 near Ponno where there was canal irrigation one can the difference; the villages with irrigation were well off; but that was where irrigation was available in the famine time. I think also that much can be said in favour of small tanks. Peaple say they foll when they are most wanted, but in a year of drought there is often early rain which is sufficient to fill them and carry craps to maturity.

Sir Colin Moncrieft .- We have naticed a very striking rise in the famine year in the orce irrigated.

Mr. Ibbetson.- Especially in Ahmednagar.

Mr. Monteath .- In Gujarot also there was a considereble risa.

Mr. Ibbetson.-Yes, owing to the construction of kachekn wells.

Sir Colin Monerieff.—Can you give us any idea of the protective value of irrigation works which fail is a very dry year?

Mr. Monteath .- I bave no information.

Mr. Muir-Mackenzie.-Wo chall get that in Shola-

Mr. Monteath.-Also in Dharwar.

Mr. Ibbetson.—That is chiefly in the ghat portion of the district?

Afr. 1 district.

Mr. Monteath.—The tanks are scattered over the whale district.

Sir Colin Moneyief.—Our enquiries tend to show the wast importance of constructing storage tanks in tracts of assured rainfall.

Mr. Monteath.—Yes, I hope that more canals like the Nim may be possible.

Mr. Higham .- The Mahladevi tank promises well and will, I hope, 'Irrigate'a larga area.

Mr. Montouth.—It should afford good protection if the 'available water is distributed over a wide area.

Air. Higham.—Take a village of 500 people with the usual orea of dry cultivation; if we irrigated 100 acres would it save the people from the necessity far famine

Mr. Monteath.—I think it would have that effect. I noticed in the famine that in villages in which there was a considerable irrigated area, not only those who held that area, but the whole population, seemed to be better off than in other villages.

Mr. Higham.-Woald you ever get the whale villege on famine relief?

Mr. Monteath.—Yes, if the works are close, sometimes virtually the whola population comes on a wark.

Mr. Higham .- What woold be the average number on

Mr. Monteath.—Thirty per cent. as an axtreme figure. The 100 cores of irrigation would not only probably keep 150 people of relief, but with that omount of irrigation I think that no one in the village would have to go on relief, if the water were well distributed.

Mr. Muir-Mackenzie,-Mr. Visvesvaraya says that on the Nira caoal deriog the famine time the people then selves arranged that each holder should have n small patch under irrigation.

Sir Colin Moncrieff.—I suppose it would be difficult to estimate the maximum area to which the benefits af irrigation could be extended. Some af our witnesses have stated that not more than 10 per cent. of the culturable area could be protected by wells.

Mr. Montenth.—It would be difficult to say; the proportion that could be protected varies greatly in different districts. In the Eastern Deccon probably not more than one-tonth could be protected by wells and tanks dependent on scanty rainfall. In Gujarat probably semowhat more than one-tenth could be protected by wells; in the Western Decan districts, large tanks constructed in the Ghât range might greatly raise the proportions.

#### TAKAVI LOANS.

Sir Colin Moncrieff.—We have heard very various opinious expressed an the question of taken grants, and as to the probable effects of lowering the rate of interest, or of charging interest and not recovering the principal, or of giving a grant and recovering by increasing the assistment.

Alr. Monteath.—I think that in any case the demands for takavi will now be heavy and as high as we con meet. The rate of interest has had no effect in discouraging applications.

Sir Colin Moncrieff.—If Government were to forego interest for, say, five years?

Mr. Monteath .- I doubt if it would have much effect.

Sir Celin Monericff .- As regards delays in obtaining takavi?

Mr. Monteath .- I think that some anquiries are necesrary before granting an odvance; for instance, in and case after an advance had been given it was found that tha land did not belong to the borrower; mather man claimed the lend and were his asse, and na recovery from the land was possible.

Mr. Ilbetson.-Under the law is not the land responsible for the loon?

Mr. Monteath .- I do not think so; the low officers have held that where there is a decree hanging over the land when the loan is given, the Government demand does not take procedures of the unexecuted decrea.

Mr. Ibbetson.—If money is speat on a well and improves the land and the secority, would it not be foir to legislate and make the advance a first charge an the land?

Mr. Montcath .- Yes, I think it would be reasonable to make the advance the first charge whore the money is really apont on the land.

Mr. Muir-Mackenzic.—The Records of Rights, on which we are beginning to work, will assist us a great deal.

Mr. Receiver.—Our whole experience in India goes to show that the amount of takers which we fail to recover is very small. I think we might venture more where the risk is so small.

Mr.J. Monteath. Mr. Monteath. Mr. Monteath.—Yes; in this Presidency also the people generally make no difficulty about repaying taken; but the naventages ore now very widely uppreciated and we can easily attlize as much as can be made available.

easily ntilize as much as can be made available.

Mr. Ribelson.—The difficulty is to ensure that the money is really spent on the well. One suggested cure is that the money should be given in small instalments; this is bed in some ways; it leads to some delay, and there is more risk of some of the money not reaching the horrower; but it is effective, as a second instalment would not be given until the first had here properly spent.

Sir Colin Moncrieff.—The law allows 20 years for the recovery of takaoi, hat the district officers allow much less; why ere they harder than the law?

Mr. Monteath.-I do not know.

Mr. Ibbeteon.—It is just the same in the Punjab; the idea is to save the borrower from heavy interest charges.

Sir Colin Monorieff.—It has been suggested to take payment of interest only and not to recover the dobt.

Mr. Monteath.—I would not go so fur; it would become a bereditary debt.

Mr. Ibbetson.-Yes, and the well might fall in.

Mr. Muir-Mackenzie.—We might take the risk; our stone wells last for ever with very little repair.

Mr. Monteath.—I think that liberality should be exercised in susponding repayment in hod years, but I would not go further.

#### KATHIAWAR.

Sir Colin Monerieff.—Have you had any experience in Kathiawar?

Mr. Montoath.—I visited it in the famine, but have not served there.

Sir Colin Mancrieff.—Do you consider that political difficulties, arising from the latermingling of the States, are likely to give trouble in connection with irrigation works?

Mr. Monteath.—I suppose there will be difficulties, but I think they might be avercome.

Sir Colin Moncrieff.—Then there is another difficulty as regards the owners of laad in the heds of tanks. No compensation by measy payment will satisfy them; they must have land in exchange and there is no lend available.

Mr. Ibbetson.—It is losing the proporty in the land that they object to; could not that he left with thom ?

Ms. Monteath.—What they are most joalous about parting with is their jarisdiction.

#### FAMINE WORKS

Sir Colin Monorieff.—Whot, in your opinion, is the best form of employment for famine labour?

Mr. Monteath.—Large tanks; where the work is concentrated, discipline and supervision are easy. Village works, which, according to the last Famine Commission, should be the backhone of relief, are, in my opinion, impossible in this Presidency on a very large scale. No arrangements can be made for expervising a very large number of such small works as the repairs of village tanks. There is no village organization, and no one in the village who can be trusted to supervise the work; there are no panchayete except for settling caste disputes and no coperation except for very epocial purposes. For the want of mything better a great deal has been done in breaking road metal by famine relief leboar; but here the question of the subsequent maintenance of the road arises; a metalled road is the worst road of all nuless it is kept in repair. I don't, however, agree that here here all value of the of common of employment; it has a great advantage in simplicity as regards individual poyments.

Sir Colin Moncrieff.—Would you complete now, by ordinary labour, such works as the Visopar tank which we saw the other day?

Mr. Monteath.—When work is so neor completion us to pay interest on the cost of completion and the maintenance charges I would finish it; but if much remained to be done, I would leave it till the next famine.

Sir Colin Monerieff.—I fear that the puddle in the treach would deteriorate and become useless if left dry for a number of years.

Mr. Higham.-Yes, I think there might be that danger.

Mr. Monteath.—One objection to large tanks for famice labour is that the people cannot be sent a long way; so that unless projects for large tanks can be found scattered throughout the district some other form of work becomes necessary. In Broach we could not induce the people to go from the Broach tank to more useful work. In some cases also volnable land is taken up, worth more than the irrigation will bring in—the Broach tank for iostance.

Sir Colin Monerieff.—Speaking generally, what do you consider will be the best classes of work for protecting the precarious tracts?

Mr. Monteath.—Works for extending irrigation; now that eaongh railways have been mode to prevent obsolute want of food in any part of the Presidency, but an establishment is necessary to prepare and examine projects. We have often had to emplay famine-stricken people on tanks which were reported to be very promising, but after a great deal of money was expended, detailed examinations showed that they could be completed only at ecormous cost and would he of comporatively little protective works and even would not hold water for any length of time.

(12) Questions for Revenue Officers including Officers of the Public Works Department who have had experience of the administration of water-supply.

N. B.-Officers are requested to answer those questions only regarding which they can give information from personal knowledge, or from anthenlie source.

#### A.-GENERAL

- 1. To what district or tract do the answers below rofar?
  What opportunities have you enjoyed of becoming acquaintad with it?
- 2. Whet is the nverage rainfall in each month of the year?
- 3. Is there any obstacle to the extension of irrigation arising from-
  - (1) spareity of population ?
  - (2) insufficient supply of cattle suited to the cultivation of irrigated land?
  - (8) insufficient supply of manure?
  - (4) unsuitability of soil (e.g., block cotton soil) to irrigation?
  - (5) uncertainty of the supply of water or its too late commencement or too early cessation?
  - (6) lack of copital for the initial exponditure or of funds for the more expensive cultivation of irrigated crops?
  - (7) fear of enhanced rent or revenue assessment?
  - (8) uncertainty of tenure or defects of the Tenancy Law P
  - (9) other reasons?

- 4. For what period, if any, is land which is irrigated from works constructed by private capital exempted from enhancement of assessment on account of the irrigation? How is the exemption secured in practice? Is any similar exemption from enhancement of rent extended to tenants who have extended irrigation to their holdings at their own cost? Do you consider that the existing provisions in this respect are sufficiently liberal? If not, what alterations would you suggest?

  S Are been ander the Land Landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landauer of the landaue
- 5. Are loane nader the Land Improvement Act freely taken by the people for the extension of irrigation? If not, why not, and what measures would you enggest for the encouragement of these loans? Would you recommend—
  - (1) reduction of the rate of interest?
  - (2) remission of the laterest?
  - (3) partial remission of the advance P
  - (4) total remission in cose of failure of the attempt to obtain water?
  - (5) extension of the period of repayment?
  - (5) extension of the (6) grants-in-aid?

6. Does the extension of irrigation tend to injure the remaining oultivation by attracting its oultivators to the irrigated tracts?

can you give any instance of this which has come to your knowledge? Is there eav strong desire evinced among the recolo of your district to have means of irrigation extended to it or increased?

- B .- CANALS OF CONTINUOUS FLOW.
- 7. To what extent does the irrigation increase the value of the produce of land-
  - (I) by rendering it possible to cultivate two harvests instead of one ?
  - (2) by leading to the substitution of more for less valuable crops or varieties?
  - (9) by increasing the yield-
    - .. (a) in year of ample rainfall?
      - (b) in a year of scanty minfall?
      - (c) in a year of drought ?
- 8. Can you give an approximate estimata of the increase in the total numual value of the produce per acre due to the irrigation-
  - (1) on the average of a normal torm of years?
  - (2) in a year of drought ?
- 9. What is approximately the average annual rate per acre paid on account of irrigation -
  - (1) by the cultivator (or the owner?) of the land to the owner of the caeal in the form of water-rate or otherwise?
  - (2) by the caltivator to the owner of the land in the form of enhancement of reat or otherwise ?
  - (3) by the owner of the land to the Government in the form of enhancement of revenue, water advantage rate, owner's rata or atherwise ?

In each case please state whether the rate is paid on the area natually irrigated during the year, on the area ardinarily irrigated, on the whole irrigable area, on the total area of the helding, or how.

- · 10. What, if any, private expenditure is necessary to bring the water twithe field or to prepare the land for irrigation? Is this generally incurred by the landlord or by the tenant? If by the latter, what security has he for recompmont P
- 11. Has noy damage resulted to the people or deteriora-tion to the sail from irrigation without manure, from too profuse, too extensive, or too frequent irrigation, from water-logging, sait efforcessence or otherwise? If so, what water-togging, rate emorescence or otherwise? It so, what is its form, its extent and, in your opinion, its cause and the possible remedy? Of what standing respectively are the arrigation in gar-tion and the evil which has sprung from it? Is the letter increasing? What is your experience of the results of draining irrigated land?

#### C .- CARALS OF INTERMITTENT FLOW.

- N. B.: Small terigall in channels, supplied by temporary dawn thrown server hed, are included under this beading.
- 1 12. Please describe generally-
  - (1) the manner in which the (or group of causts) in the district is supplied with water;
  - (2) the manner in which the water is distributed to the land :
  - (3) the period for which the supply is ordinarily majotalned-
    - , (a) in a year of ample rainfall;
    - (b) in a year of scanty ruinfall;
    - (c) in a year of drought.
- 13. To what extent does the irrigation increase the value of the produce of land-
  - (1) by rendering it possible to cultivate two harvests instead of one?
  - (2) by leading to the substitution of more for less rainable crops or varieties ?
  - (3) by increasing the yield-
    - (a) in a year of ample rainfall ?
    - (b) in a year of scauty rainfall ?
    - (c) in present drought?
- 14. How for is the value of the irrigation diminished by-
  - (1) the too la'e commencement?
- : (2) the too early ossiation of the supply ?
- 15. Is the irrigation ordinarily supplemented by irriga-tion from wells given to the same land and, if so, how far is this associal?
- 18. Can you give an approximate estimate of the increase in the total manual value of the produce per acre due to the irrigation-

- (1) on the average of a normal torm of years?
- (2) in a year of drought?
- 17. What is approximately the average annual rate per nore paid on account of irrigation-
  - (1) by the cultivetor (or the owner?) of the land to the owner of the causl in the form of water-rate or . otharwise ?
  - (2) by the cultivator to the owner of the land in the form of enhancement of rent or otherwise
  - (3) by the owner of the land to the Government in the form of enhancement of revenue, water advintage rate, owner's rate or otherwise ?
  - (4) hy the ewners of the canal to the Government in the form of royalty ?

In each case please state whether the rate is paid on the area actually irrigated during the year, on the area ordinarily irrigated, on the whole irrigablesures, an the total area of the helding, or how.

18. What, if any, private expenditure is necessary to bring the water to the field or to prepare the land for irrigation? Is this generally incurred by the landloid or by the tenant? If by the latter, what security has he for recoupment?

19. Has any damage resulted to the people or deteriora-tion to the soil from irrigation without manner, from ton profuse, too extensive or ton frequent irrigation, from waterform, its extent and, in your opinion, its eause and the possible remedy? Of what standing respectively are the irrigation in question and the evil which has spring from it? Is the latter increasing? What is your experience of the results of draining irrigated land?

20. How is the maintenance (repairs, silt clearance and the like) provided for, and what is the approximate annual cost per acre irrigated? Does the system work fairly well and is noy legislation required?

- 21. Were any of the canals constructed by private persons? Has any trouble arisen in such cases in regard of the supply of nater by the owners of the canal to other owners of land, or of the realisation of dues for the same? Has it been found accessary for Government to take ever the management of any private canals, and If so, why?
- 22. Do you consider it advisable to onconrago and assist the construction by private persons of further canals, and, if se, how could this best be done?

#### D.-TANKS.

- 23. Please describe generally-
  - (1) the way in which the tanks in the are supplied with water ;
  - (2) the manner in which the water is distributed to or utilised upon the land;
  - (3) the period for which the supply is ordinarily maintained -

    - (a) lu a year of supple rainfall; (b) in a year of scauty rainfall;
    - (c) in a year of drought.
  - (4) the area ordinarily irrigated from a tank.
- 21. To what extent does the irrigation increese the value of the produce of land-
  - (1) by rendering it possible to cultivate two harvests instead of one?
  - (2) by loading to the salstitution of more for less valuable crops or varieties?
  - (3) by increasing the yield-
    - (a) in a year of stuple rainfall?
      (b) in a year of scanty rainfall?

    - (c) in a year of drought ?
- 25. How far is the value of the irrigation diminished by
  - (1) the top late commoncement?
  - (2) the tao early cossation of the supply ?
- 26. Is the irrigation ordinarily supplemented by irrigation from wells given to the same land and, if so, haw far is this essential?
- 27. Can you give an approximate estimate of the increase in the total annual value of the produce per acre due to the irrigation -
  - (1) on the average of a normal term of years?

- (2) in a year of draught?
- 28. What is approximately the average annual rate per acre paid an account of irrigation—
  - (1) by the cultivator (or the owner?) af the land to the owner of the canal in the form of waterrate or athorwise?
  - (2) by the cultivoter to the awner of the land in the form of enhancement of rent ar otherwise?
  - 3 by the awner of the land to the Government in the form af enhancement of revence, water advantage rate, awner a rote ar atherwise?

In each case please state whether the rate is paid on the area actually irrigated during the year, on the area ordinarily irrigated, on the whole irrigable area, on the total area af the halding, ar how.

- 29. What, if any, private expenditure is necessary to bring the water to the field or to prepare the lond for irrigation? Is this generally incurred by the landlord or by the tenant? If by the latter, what security has he for recoupment?
- 30. Haw is the maintenance (watching, repairs, silt olearance and the like) provided for? What is the approximate annual cost per nora irrigated? Does the system work fairly well and is ony legislation required?
- 31. In the case of tanks constructed by a private person ar persons how is the distribution of water to the other awners of land regulated or arranged for? Has my tranble erisen in this respect or in connection with the realisation of water dues? If so, is Government assistance advisable and is any legislation required?
- 32. Da yan cansider it advisable to encourage and assist the coestruction by private persone of further tanks; and if so, how could this best be done?
- 33. Io much inconvenience experienced from the liebility of tanks ta eilt up? Cun you give any statistics as regards the doth of silt accumulation per annum? Is it the custam to remove the silt by dredging or otherwise? If not, what steps are taken to prevent the ultimate silting up of the Whole tank?

E.-WELLS.

- 34. Please stote generally for each of the main tracts into which the district is divided.-
  - (1) the overage depth of permanent wells;
  - (2) the nature of the supply, whether from springs or from percolation, and whether liable to feil or become too saline to use-
    - (a) in an ordinery year;(b) in a year of drought;
  - (3) the average cost of construction;

- (4) the average duration of a well:
- (5) the manner in which the water is usually mised :
- (6) the average area attached to ond commouded by a
- (7) the average area irrigated in any ane year.
- 35. To what extent does the irrigation increase the value af the produce af land
  - (1) by rendering it possible to cultivate two harvests instead of one?
  - (2) by leading to the substitution of more for less valueble craps ar varieties?
  - .(3) by increasing the yield-
    - (a) in a year of ample rainfall P
    - (b) in a year of ecanty rainfall ?
    - (c) in a year of draught?
- 36. Can you give an approximate estimate af the increase in the total anumal value of the praduce per acre due to the irrigation-
  - on the average of a narmal term of years?
     in a year of drought?

- 37. Whot is approximately the average annual rate per nere peid on account of the irrigation-
  - (1) by the cultivator to the awner in the chape of
  - enhancement of rent?
    (2) by the awner to Government in the chape of enhancement of revenue?

Are these rates paid on the tatel area attached to and commanded by the well or an the area actually irrigated during the year, or how?

- 39. Are serious difficulties often encountered-
  - (1) in the selection of a spot in which a supply of water will be obtained?
  - (2) in the actual construction of the well?

Hes assistence over been aftered by Gaverament or by local badice in the shape of oxpert advice, trial borings, the use af hering tools, or otherwise? If so, how far has assistance been made use af and found successful? If not, do you think it would be useful and how could it best lo given?

- 39. Are you in favour of the construction by Government of wells in land which is private property? If so, how would you work the scheme? If not, what objections do you perceive P
- 40. Are temporary wells commonly used in the—district? How far no they a protection against drought? How would you propose to oncoarage their construction in a year of scenty rainfall?
- (13) Memorandum of points to be considered by the Irrigation Cammission in Sind.
- 1. Average area irrigated by each group or system of canals as compared with the onliveble area commanded.
- 2. Proportion of flow to lift irrigation.
- 3. Grawth of irrigated area during last 20 years, separately far onch year for Right und Left Bank Canals but not for each system.
- 4. Variations in total area es compared with variations in Bukkor gauge, or fluctuations in river supply.
- 5. Areas that might be brought under irrigation by proposed extensions af axisting canals or according to
- 6. Relation of the total irrigated area to total cultivable
- 7. Area depending on well cultivation massisted by
- 8. Canale which are ordinarily able to obtain a perennial ar cold weather supply.

- 9. Extont to which the supplies to the canals have been affected if at all by the withdrawals for new canals in tha
- 10. Has the necessity far a weir at Bhakkar, as proposed by Sir E. James, been felt?
- 11. What canals would be benefited by the construction of such a weir, and to what extent?
- 12. Hove any investigations been made to show the practicability of such a weir?
- 13. Da the results so far uttained on Jamraa Canal indicate that it will be as successful and that it will irrigate ns large an area as anticipated in the revised estimate?
- 14. Areas, if any, irrigated from private canals, which are not under cootral of Irrigation Dopartment or referred to in the Administration Report.
- 15. Generally, what ecopo is there for extensions of irrigation in Sind including Kolat arother fareign torritary and in what order should they be considered?
- (14). Momorandum of points to be considered by the Irrigation Commission in the Bombay Presidency.
- 1. The gross and culturable areas in each district and the Culturable and irrigable proportions of the latter which ore protected by Government irrigation works, by private ar village works and by wells respectively. Character of the soil.

Extent to which cultivation is dependent an artificial irriga-tian. Rainfall. Is there ordinarily a demond for water in Gnjarat during south-west monsoon? What are the crops which require irrigotion and haw many waterings do they require, and at what times of the year? How is the distribution controlled, and in what form is irrigation revenno realised?

- 2. Experience as rogards black soil. Do small tanks.

  Black cotton soil.

  Constructed in such soil held water, and can high earthen dams be made of it without masonry cors walls? When the land irrigated is a black soil, is there any domand for water during seasons of average rainfall or only in case of prolonged dronght? In such soils does the irrigated area show a falling off in years of fair or good rainfall owing to slack domand and is the revenue more precarious on this account than on tanks commanding other classes of soil? Has there been a desire for irrigation works on the part of sowners of black soil, and is the construction of tanks for such soil considered as remunerative or as important as for other classes of soil?
- S. Description of existing Government irrigation works.

  Government irrigation Total annual irrigating capacity, and range of variation Ato these works to be depended on in a proposed works as in the memorandum by Inspector Goneral of Irrigation, dated 7th May Question of utilising the waters of the Narbuda, Tapti and Salarmati for irrigation of Gujarat districts. Any other possible sources of irrigation.
- 4. Number and capacities of the Provincial irrication works. Expenditure on new works and on maintrunnes during last ten years. New Provincial works, if any, sanctioned or proposed. Extent to which provincial revenoes laws been applied to the construction of new irrigation works and the limitations to such application. Hoes the Province get the whole of the increase of foreme due to the construction of such works? Have present arrangaments under the Provincial settlement the effect of encouraging or discouraging the application of Provincial revenues to works of irrigation? Is it do-irable that Provincial revenues abould in future by doyoled to the construction of such works, or should all new works be constructed from the provincial Finds? In what cases should now irrigation works be undertaked as a charge against Provincial Finds?

5. By whom constructed and controlled. Number of plathet or village works. Such works and aggregate extent of cultivation dependent on them. Responsibilities of Government in connection with their maintenance as fixed at former earliements. Average annual orporaliture, if any, incurred by Government on these works excluding expenditure on relief works during late famines. Is any irrigation realized or are temissions of land revenus given when the works fail? Have new works of this class been constructed of late years otherwise than as famine relief works? At such works and artaken by histrict flouds or by private land-owners? Is it desirable that District Funds should be expended on such works? Has it been the practice for Government to encourage the construction of such works by loans to District Boards or to land-owners? Can the protective value of these works be increased by devoting more money and greater attention to their up-keep, and by encouraging the construction of new works? Enforcement of local responsibilities in this connection. Value of such works as conversing village water-supplies for mon and cattle, without reference to irrigation.

6. Total area irrigated by wells in ordinary years and in wells.

Wells.

Wells.

Wells.

Wells.

Wells.

Wells.

Wells onstructed mountly during last ten years. Extent to which construction has been assisted by advances from Government. Concessions, if any, given to the constructors of new wells. Is it possible or desirable to stimulate the construction of new wells by more liberal advances or inducements? Extent to which wells have been affected by the droughts of 1820-1901. Were any of those which ran dry deopened, and if so, with what results? Namber failed or abandoned. Average depth of water below surface and cost of wells used for irrigation, and item served by each. Reports by Mr. Orling and Geological Officers on possibility of artosiau wells in Gajerat.

7. District or tracts in which lands or crops are injured by water-legging or excess of water in very not gener. Are additional drainage works required, oithor on sanitary or agricultural grounds P Source from which funds would be provided for such works. Would they result in any increase of revenue, or in preventing less of revenue now remitted after seasons of flood ?

8. Classification of the works on which relief labour was supplyed in the districts affected and amount expended on each class, say Roads and Road-metalling.

Railway work, including collection of ballast—Irrigation works—Villago tanks and other water storags works—Miccellancous—.

Works incompleted at and of famino which it is considered desirable to complete as a charge against Provincial on Imperial revenues. Reasons for proposing their early completion and results anticipated. Results attained on completed irrigation or storage works, especially village tanks. Have they been found to hold water and to improve or conserve the resources of the village for watering cattle, etc. ?

9. Districts for which programmes have and have not programmes of relief been prepared. Examination of programmes, especially for districts most liable to famine, with reference to the number of units provided tor, the distribution of the works over the district and their utility. Arrangements for maintaining, extending or completing the pregrammes.

10. General enquiries will be made in regard to irrigation works in Kathiawar, with reference more particularly to the works carried out during the late famine as in paragraph 8.

11. Enquiries will be made as in Gujarat as in presgraphs

Statistics for typical 1 to 8. In addition statistical information will be required regarding all the larger or typical irrigation works in the Decoan as below :—

I.—Initial statistics—
Area and nature of catchment.
Assumed average annual rainfall.
Full supply capacity of tank in m. c. feet.
Percentage of capacity on assumed average rainfall.
Water spread at fail supply.
Maximum height and total length of dam.
Cost of dam, waste weir, sluices.
Compensation for land submerged by tank.
Cost of canal and distributing olumnels.
Total capital cost.

II.—Annual statistics for each year since completion—
Rainfall of the year.
Amount stored during year.
Amount run over waste weir.
Total run off for the year.
Percentage of tun off on rainfall of the year.
Area trrigated during the year in acres.
Quantity of water, if any, left in tank at end of irrigating season and available for next year.

Initial statistics of the same kind should be given for all new projects which have been sufficiently investigated, the proposals for which will be considered by the Committee.

12. Scals of water rates an major and minor works. Are implications for water received annually, and how is distribution controlled? Effect of years of favourable rainfall on the demand for irrigation revenue. Are tanks always empty at end of irrigating season, or do any carry supplies on to following year? Do the irrigation works get a fair credit for the increase of revenue due to their construction, or is this increase limited to the amount realized as water rate. Are the obarges for unintenance and establishment fair or exaggerated by reason of the same establishment being employed also on civil works? Generally may the revenue accounts of these works be accepted as correctly indicating the financial results attained on them?

Value of works in reducins during the famine of 1897 and subsequently. Areas irrigated. Was fumine relief necessary either relief extended in the original properties of famine relief works or of grataitous relief extended in the villages protected by these works, of can any estimate be formed of the extended in the of the cost of famine relief would have been increased if these works had not been in operation?

88 Mr. K. G. Gupta, Commissioner of the Orissa Division, Cuttack	. 178—180

#### FIRST DAY.

#### Bankipore, 24th October 1902.

WITNESS No. 1 .- Mg. J. G. Couring, Collector, Paina.

- 1. Q. (The President.)—You are Collector of Patna, I understand?—Yes.
  - 2. Q. How long have you been here !- 1} years.
- 3. Q. Where were you before that P-I have been in Bhagalpere and Eastern Beagal; in the early part of my service I was in North Bihar.
- 4. Q. Have you ever had anything to do with the famine question P-No, except for a very short time in the Midnapore District.
- 5. Q. You say in your memorandum in reply to ques-tion No. 3 with regard to the character of the soil in Dibar "heavy soil on the whole; much of it cotton soil suited to the river system of irrigation." What is this exactly; is it black cotton soil, as it is elsewhere in India?—It is locally known as cotton soil; it is very friable, boggy in the rains and oracks in the dry wenther.
- ö. Q. Is it black?-Some of it is black; a portion of it is light in colour.
- 7. Q. You say "it is sulted to the river system of irrigation." What do you mean by that system ?—I mean the system of irrigation in the Bibar Sub-division where water is collected in these reservoirs.
- 8. Q. I presume it is called cotton soil, because it is suitable for the growth of the crop?—I am not aware of that. It is simply a local name.
- 9. Q. Does it take irrigation ?- I do not know enough about that to say.
- 10. Q. (Mr. Muir-Maokenzie.)-I understand that this soil that you call cotton soil is, as a matter of fact, irrigated, is it not? - Yes, it is irrigated.
- 11. Q. Whother it is the same as in other parts of India and proves refractory to irrugation you are unable to say? -Yes.
- 12. Q. (The President.)—In answer to question No. 7 you use the term nuchatra; what is that !—That is, more or less, a fortnight.
- 13. Q. You say in answer to question No. 9 " no special measures are required for private works, as the zamindars themselves keep their bunds in order." Is that general? Are there any complaints on the subject?—In the Bihar Sub-division there are no complaints. The bhack system Sub-division there are no complaints. The bhaoli system is in force there, and it is to the interest of the landlord to keep op the supply of irrigation.
- 14. Q. The bhaoli system is payment of the tenant in kind?—Yes.
- 15. Q. A proportion, not a fixed quantity?—There are varying arrangements according to which it is paid; sometimes according to proportion; sometimes by provious assessment.
- 16. Q. It is all called bhaolit-Yes, it is a general term for payment in kind.
- 17. Q. (Mr. Mair-Mackenzie.) Sometimes the tenant rays so many maunds !- Yes, in some cases after it has oeen settled what the proposed result will be.
- 18. Q. (Mr. Allen.)-It is called by different names?-Yes.
- 19. Q. (The President.)—You say in answer to question No. 8— As for Bibar, the whole sub-division is most keenly No. 3 -- AS LOS DIBER, the Whole sub-division is these Reonly alive to the concervation of water, not simply for the increase of produce, but for getting any produce at all." Where do they get their water from now; the Sone Caual or where?—Bilmar is, entirely watered by rivers that flow from the Gyn District, with a northerly and easterly trond; from the livers pains are taken and then reservoirs are constructed. From these reservoirs expenses channels load 4.4 the stracted; from these reservoirs separate channels lead to the tields.
- 20. Q. When you talk about zamiadars keeping the bunds in order, do you mean bunds across the rivers ?-I allude to bunds of reservoirs, not of rivers.

- 21. Q. Who makes the bunds ?- Zamindars.
- 22. Q. Is that done satisfactorily generally ?—I cannot say; the only way we are concerned with it is that it is a source of constant quarrels between the neighbour-
- 23. Q. Do you consider there is any necessity for legislation on the subject, in order to provent these disputes?—It is very difficult for me to say.
- 24. Q. You have not been long here, I recognize that ?— I certainly think it would be a good thing if the Collector had the power to interfere at the beginning if he thought it proper to do so; and when he thought he could settle a disputo which otherwise meant years of litigation.
- 25. Q. Has any ramindar the right to put a bund across a stream to divert water into his chanuel?—At present nothing new is done; it is laid down by prescriptive custom or decree of the High Court; overy bund has a dooree of the High Court about it.
- 26. Q. I didn't know whether there was a fixed number of bunds?—The number now is fixed. Any change at the prevent moment would be resented by every body.
- 27. Q. It must be a very rough-and-ready system as regards the proportion of water for distribution?—Yes, that is my impression.
- 28 Q. Are bunds made right across the rivers or are they merely directing groupes? I don't understand if the river is bunded right across again and again?—Usually they have a small channel which takes the overflow to the lower recohes; in some places the bund of a small river is stopped up entirely.
- 29. Q. You say in reply to the same question-" But I would recommend a thorough survey and examination of the schemo for a large recorvoir at Ghora Katora on the south of Bihar, whereby the entural drainage from the Gya range of hills could be utilized." Has this reservoir espan ange or mile could be unived. The time reservoir scheme been gone into at all?—It is at the extreme end of the range of hills in the Gya District, and about three years ago was examined by way of recommissance, after which it was proposed that a proper survey should be made; the then Collector has since left the district and left no note about it. I discovered it quite by neoident, and on looking up the papers found that it was proposed to irrigate 300 neres at a cost of Rs. 12,000; it could have been lot out at a rate of Rs. 5 per bigha. At present it is all scrub and jungle.
  - 80. Q. It is a small schemo?-Yes, quite small.
  - (Mr. Allen.)-For irrigating a Government estate.
- alt. Q. (The President.)—I suppose you would say as regards faming that your district is immune? Faming is not to be provided for to any great extent?—That is correct as a general statement. The South Bihar Sub-division is akin to the Gya District, and there are parts for which in past years a good deal of anxiety has been felt; the rest of the district is either on the bank of the Ganges or is commanded by the Sono Canal system. The district is practically immune from serious famine.
- 32. Q. Do the lands commanded by the Sone Canal system fetch a larger price than others?—I have no partionlar knowledge on the subject.
- 38 Q. Has the fact of steady, constant irrigation raised the quality of rice in these districts. We have heard in some places that a distinctly superior style of crop was grown?—The irrigated rice is very fine, but I cannot say how far it has improved.
- 34. Q. Have you any complaint of the mischief done by canal water, comparing the irrigation done by the Sono Canal with the irrigation by chars or wells? The reason I ask is that Mr. Tytler, formerly of the Onium Department, says in a noto—"Canal water is chiefly good for paddy, for which crop, however, it is, if irrigation is required, a necessity, as it fleeds the land, and paddy

. Mr. J. G. Cumming. 24 Oct. 02.

Cumming. -24 Oct. 02.

- Mr. J. G. thrives standing in water. For most other descriptions of orops it is more or less injurious, while the harm it does is progressive, icoreasing each year the water is 24 Oct. 02.

  Which for cereals and for the coil is barmful, hecause it which for cereals and for the coil is barmful, hecause it is colder than the atmosphere, nud so far as I know is devoid of fertilising properties owing to its pareness." Have you heard anything about this?—No.
  - 35. Q. Yon say in reply to question No. 11 that "well-cultivation is largely practised in the higher land for poppy and vegetables. Especially it is noticeable in the potate-growing area in the neighbourhead of Potaa." I suppose rice is never grown under wells?—I think not.
  - 36. Q. The greater part of your district is rice; it is hardly worth taking into account other crops?—All along the hank of the Ganges rice is the least important.
  - 37. Q. What other crops are there?—On the banks of the Gaugee they depend in the early spring, the rabi, crop They also have a very good bhadei.
  - 38. Q. Would they merely water from the overflow of the river?—Immediately to the south of the East Iudian Railway line ie a large tract which is fleeded almost overy year; that grows an excellent crop of rabi.
    - 39. Q. It does not require welle?—No.
  - 40. Q. Are there any takavi advances given for sells?—There is no demand for wells. I have tried to posh advancee, but there is no demand.
  - 41. Q. You say in roply to the last question—"I believe in offering joint advances to villages when they are hard pushed for water, in order to construct many temporary kachcha wells, but permanent wells must be left to the foresight of the zamindars or of the Local or District Board take an interest in mether 2. No not in wells for irrection. in irrigation matters ?-No, not in wells for irrigation.
  - 42. Q. Are these wells mostly for village purposes ?-Yes.
  - 43. Q. (Mr. Muir-Mackensie.)—You say in reply to question 5A "there is no record of a serious famine within the last 25 years." Is there any record of n previous famine?—I cannot find any.

- 44. Q. Has a record-of rights been introduced into the Patua District yet?-No.
- 45. Q. You sey there were these disputes about the management of the pains. Do you think the record-of-rights in woter might profitably be introduced at the same time as the record-of-rights in land ?—Yes. It would be n good thing to record the decisions as regards rights in water.
- 46. Q. Could that be dooe without legislation?—That is difficult for me to say. If I was a Settlement Officer, I would certainly do it.
  - 47. Q. You have been Sottlement Officor?-Yes.
- 48. Has it ever been your practice to record rights of water?-No, because the case did not arise.
- 49. Q. You say that the management of these bunds lead to disputes; if they have gone to the High Court for every important bund, what is there that remains to be disputed over?—They wou't respect the High Court's ruling. At the present time I have got a special police force in three villages.
- 50. Q. The special force is necessary to enforce the High Court ruling ?—Yes.
- 61. Q. Having regard to the existing amount of irrigation in these ports of the district, which ore not served by the Sone Canal, is thore much room for extension?— In the Bihm Sub-division, as far is my experience goes, I think we have done all that there is to be dooe.
- 52. Q. You don't think it would he worth while serveying the country to see if anything more could be done?— Certainly not.
- 53. Q. You don't think by o liheml provision of takavi that much extension would result?—I think not.
- 64. (The President.)—Have you got any famine works programmes?—We have no more than provision for the mising and repairing of existing roads.
- 55. Q. Is the District Engineer responsible for that ?—
  It is he who has prepared this.
- 56. Q. Is it kept up to date?—I have brought it up to date at the present time.

Witness No. 2.—Me. Ran Anugran Nabayan Singh, Deputy Collector, Patun.

Mr. Ram Anugrah Singh.

24 Oct. 02.

Note on legislative measures for interference of the Collector in the matter of irrigation disputes and imposition of irrigation cess.

I ngree with Mr. Oldham that to prevent disputes and breaches of the peace in the matter of irrigation dis-putes and in the interests of pooler and weaker landlords, the Collector's interference would be necessary. The richer zamindare as well as poorer zamindars would welcome the decision of the Collector who knows all about his district. His decision will be obtained at once and without cost cod save them the law'e delaye and rainous costs. The payment of small cess by lands protected by the canals and water-works and hencetted by them will not be gradged gradually, though there may be some pinch felt in the beginning. In a year of drought the gratitude must be nekoowlodged and payments of other years well recouped.

#### Note on Karamnassa-Bhabua Irrigation Water Scheme.

From what I know of Bhaban and the adjacent tracts of lands in Sasamm and United Provinces, I am very confident of the success of the scheme to catch the sarplas water of the Karamassa into a big reservoir or small reservoirs as may be decided upon professionelly by skilled engineers. There is a very large tract of land which is lying waste and which can be converted into good paddy-producing tracts by means of irrigation from the artificial

producing where an included in the same amount of certainty on regards other schemes,

#### Note on the Queries of the Irrigation Commission.

- 1. In my capocity as Deputy Collector and Mogistrate I know the districte of Saran, Gyn (including the Subdivisione of Anrangabad), Shobabad (with the Sub-divisions of Sasaram and Bhahoa), Champaron, Darbhonga and Putus where I hold lauded property.
- 2. It is monifest to every one interested in lend—land-lords, farmers, tenure-holders and teoants—that the canals and the village irrigation works consisting of water reser-

voirs, with conduits and other sorts of village channels, are great protection against famine.

- 3. The districts of the Patus Division to the south of the River Gauges, viz., Patue, Shahahad and Gya, are fortunate to have the Sone Causle besideen net-work of village irrigation channels, and so they are less limble to feel the pinch of famine and scoreity, except in portione of tracts where these facilities do not exist.
  - 4. (Q. 1.) Answered by District Officers.
- 5. (Q. 2.) High lands (hilly and jungli lands) where irrigation is not possible on neconnt of non-existence of wolls or water-courses are liable to famine or scoreity.
- 6. (Q. 3.) The circumstances vary in different districts generally; the kewal coil is enitable for paddy and wheat and the sandy soil is for bhadoi and rabi crops.
- 7. (Q. 4.) Generally on wells and upon the supply of water in the water-courses (dependent on rainfall) and upon the mointenance of the dams and banks of reservoirs.
  - 8. (Q. 5.) Charts furnished by District Officers.
  - 9. (Q. 6.) General answer.

Soll. Crop. Whee sown When reaped. Rice Low land Jnne-July. November-December. Highland { Bhadoi, May-Juac. maize. September October. Rabi, November March-April. Both (Rabi, November. wheat, December. gram.

10. (Q. 7.) General answer.

Bhadei crops (maize-Fwo), etc., from May to September. Kedo-Poriedical showers, May to September.

Aghani rice-Every nachchatra.

(Shown in tuble accompanying this note shewing agricul-tural operations in the year) except one from May to Soptomber.

Poppy—Continuous irrigation in Ostober, November and December.

Wheat-Light showers from October to January.

Rabi orops—Rain wanted in September, October and Docember.

Sngarcano-Specially in April, May and June.

11. (Q. 8.)-General.

Irrigation, as at present carried ont by local zamindars, is premature and in places dangerous to reads and railways. If the damming of streams in undulating country, reservoirs in hill tracts and minor canal schemes were carried out on engineering principles, they would be extremely beneficial and would avert to a great extent famines in future.

- 12. (Q. 9.) The District Boards might take over larger irrigation works in villages. Government may appoint a Special Irrigation Engineer to advise the Local District Engineer. Works of ordinary nature would, in most cases, be carried out by local rich landlords. Where poorer zamindars are concerned, a grant-in-aid by Government or District Board should suffice.
- 13. (Q. 10.) Alars or reservoirs are made in the undulating country by raising endaukments on three sides, the high side requiring none. Rain water is caught in these reservoirs and carried to fields by means of conduits or village channels. These reservoirs are constructed and controlled by zamindars. The small embankments often collapse when rainfall is heavy, especially when repairs are neglected. They are very premature in their make and sometimes source of great danger to reads and susceptible of great improvement. If made on originaring principles, they would be less expensive to the zamindar in the long run and prove works of great utility.
- (Q. 10x.) Reservoirs belong solely to zamindars, and no assistance is granted from Government.
- (Q. 10b.) No concession is given for construction of water reservoirs by zamindars.

- (Q. 10c.) Obstacles to extension of water-works.
  - (1) Want of knowledge as to the best means of utilising the water in the rivers, streams, etc., in the country.
  - (2) Want of assistance on behalf of Government.
  - (3) Want of means.
  - (4) Want of combication among local zamindars owing to after dispute or to the partition of water.
- (Q. 102.) No restriction of any kind is imposed by Government in the matter of the construction of new works. Streams are dammed haphazard, causing jealousies and often disputes between zamindars, which involve them in expensive law-suits.
  - 14. (Q. 11.) General.

Well cultivation is used in higher lands for poppy and vegetables.

- (Q. 11a.) The average depth of water varies very much. Generally it may be put down as 40 to 50 feet in the dry wenther.
- (Q. 11b.) Kachcha wells cost about Rs. 5 or Rs. 6. Good wells would cost about Rs. 100.
- (Q. 11c.) About 2 acres is the area commanded by one lever.
- (Q. 11d.) In very dry weather the water level is very much lower in wells than in other seasons, so the difficulty of keeping the water free for use increases. Good pakka wells do not dry up.
- (Q. 1)c.) The Opium Department makes advances for construction of new wells.
- (Q. 11f.) It is desirable to stimulate the construction of new wells by more liberal advances or inducements.

Mr. Ram Anugrah Narayan Singh.

24 Oct. 02.

- 1. Q. (The President.)-You are Deputy Collector?-Yes.
- 2. Q. Of what district ?-I was in Patna. I um uoder orders to go to Muzafforpur.
- 3. Q. You say in your noto "I know the districts of Saran, Gyn (including the Sab-divisions of Aurangebad). Shahahad (with the Sub-divisions of Sasaram and Bhabna), Champeran, Derbhanga and Potna." In fact, you know the whole of this Division ?—Yes, except Muzassarpur.
- 4. Q. Have you come across famine ?-Yes.
- 5. Q. Whon was that ?-In 1878-1874.
- 6. Q. When Sir Riebard Temple was Lieutenent-Governor i—Yes.
- 7. Q. If the Sone Cauals had more water then they have would there be no icorcase of irrigation? Is there enfor the wants of Patco?—We wont more distributaries. Is there enough
- 8. Q. Would the people take the water?—Yes, where the distributaries reach the fields.
- 9. Q. If there was double the present amount of weter would there be double the area of irrigation?—Yes.
- 10. Q. Are you aware of ony had effects produced by this irrigation?—The canal water is very honoficial for paddy, but for rabi it is too oold.
- 11. Q. Are these carcals not . irrigated F-There is no extension of well irrigation. They depend on the dews of the winter months.
- 12. Q. You heard Mr. Cumming's evidence just now; is there anything you would add to it in connection with disputes !- I have only to say that all cases do not go to the High Court; only the rich zamindars can take them up; the poorer zamindars cannot go in for civil litigation; it is poorer zamindars cannot go in for civil litigation; it is very expensive, and they would hail with dolight the appointment of the Collector to decide disputes.
- 13. Q. You think some legislation would be of value? Yes. I have read with luterest o mper by Mr. Oldbom, Collector of Gya, and I know that several cases came before me where the poorer zamindars did saffer from the action of
- 14. Q. (Sir Thomas Higham.)—Are you speaking of Government canals !- No, private irrigation, embankments, Pains, otc.
- 15. Q. (The President.)—Is land more valuable on the Sone Canals than elsewhere?—The growth of raddy is assured just where the Sone Canal passes, and so the valoe has increased; that was not the case prior to the existence of the Sone Cauni.
- 16. Q. It is an insurance against unfavourable seasons?-Yes, exactly.
- 17. Q. You are aware that the cause have not returned much revenue to Government P—Yes.
- 18. Q. Supposing there are cases where conals are mode by Government to afford protection against famine or less of crop, but which would not be directly remunerative, take, for instance, a district like Bhabua Sub-division which suffers periodically, would the people there accept a cess as a sort of insurance in a year of drought?—In the first year or so it would not be liked, but in the long run it would be. In Bhabua there is a large tract of land that you could covert into paddy fields; if water is extended to that, the people will not begrudge a water cess.
- 10. Q. You say in reply to question No. 9 "the District Boards might take over larger irrigation works in villages. Government may appoint a special Irrigation Engineer to advise the Local District Engineer." Do you mean for purely small local works?—Yes, on account of ignorance on the part of the people, dams are put up haphozard which do considerable harm. An uninterested party should give pro-fessional advice as to where to put a dam, so that everyone would be benefitted.
- 20. Q. Would the zamindars accept the decision of the District Board in that matter?—They will accept the decision of the Collector. In Bihar he is always the Chairman of the District Board.
- 21. Q. Do you think District Poards might be induced to take more interest in irrigation P-They ought to, and I think they will.
- 22. Q. I suppose these rivers which go from the Gya hills must be very often silted up; is the silt eleared out by anyone ?- No; the old bods oud water-courses are cleared ont by the zamindars where they receive rents in kind.

- 23. Q. I suppose sometimes zamindors further down the Mr. Ram stream suffer?—Yes.

  Anugrah
- 24. Q. Coold District Boards interfere usofully in a case of that kind ?-Yes.
- 25. Q. (Sir Thomas Higham.)—You propose these minor irrigation works be taken over by District Boards. Do the District Boards in Beugal have irrigation works belonging to them P-Not at present.
- 26. Q. (The President.)—Mr. Alleu oxplains that the District Boards are precluded from interforing in irrigation' metters, as funds are all car-marked and there is no surplus.
- 27. Q. (Sir Thomas Higham.) Where would the district get the money from P—They have to lery a cess for the maintenance of roads.
- 28. Q. That would not apply to irrigation works?-We woot special legislation.
- 29. Q. In that case do you think the District Boards would be the proper agency P-Yes, at present they manage not only reads, but dispensaries, schoole, etc.
- 3). Q. Have District Boards to do with irrigation works?-Not of present.
- 31. Q. Would not the money obtained from the cess go to benefit only a very few individuals ?—Not necessarily; they maintain all the roads.
- 32. Q. I want to know where they are to get the money?—They realize cortain cesses by which they maintain roads, dispensaries, solvols, otc.
- 33. Q. But your irrigation works will be for the boucht of a few samudors, out for the benefit of the district as a whole ?- There will be better except.
- 31. Q. You propose to cess the whole district for the benefit of a few P—Whot I intend is for the benefit of those protected.
- 35. Q. Oat of the proceeds of the cess you propose to make the works?—Yes.
- 36. Q. You think there will be no difficulty in intro-ducing a cres of that kind?—No, the persons benefitted would pay.
  - 37. Q. That would require legislation? -Yes.
- 38. Q. You say no restriction is imposed in constructing on bunds?—No, the zamindar can construct a bund now bunds ?whorever he likes.
- 39. Q. If he outs off the supply from people lower work—Then he is prosecuted crimically under the Indian Penal Code.
- 40 Q. Is that not sufficient?—That is merely the thin ond of the wedge; litigation goes on and oosis lokhs and lokhs. If the Collector has the power to interfere, he would go to the spot and settle disputes; the people would bail with delight such a change of law. It would be been field to the year. ficial to the poor.
- 41. Q. Would you propose that no oue should be allowed to obstruct the stream without the permission of the Collector P—The Collector should have the power of inter-
- 42. Q. Will that not be after the mischief is done? zamindar knows when his rivel is going to put up a dam, and he would at once go to the Collector and sattle the matter. The Collector just now has not the power to do anything, except to issue an executive order to prevent a broach of the peace.
- 49. Q. (Mr. Muir-Mackensie.)—Do you thick that irrigation is capable of much extension in the tracts with which you are acquointed?—Yes.
- 44. Q. In which particularly !- In the Bhabua Subdivision of Potun
- 45. Q. Do you think irrigation could be much extended with adventage in Patna ? You.
- 46. Q. Mr. Cumming, the Collector, soid just now he did not think it could; that all hed been done that could be done?—He speke of another part.
- 47. Q. Could it be done by private effort, if money were advanced to the zamiadars?—Yes, I think so.
- 48. Q. You think they would be glad to take takevi?-
- 49. Q. Do you think the machinery for advancing money is satisfactory ?—No.
- 50. Q. Why do you think it is not ?- I think those who wish to give advances should go to the Mofusil and on the

Singh.

Anugrah

Narayan

Mr. Ram Anugrah Narayan Singh.

24 Oct. 02.

spot pay the people either in each or by cheque whichever was convenient.

51. Q. At present a man has some difficulty in getting an advance ?—Yes.

52. Q. He has to go to the Collector's office ?-Yes.

- 53. Q. And vory often that is at a considerable distance ?
- 54. Q. So that considerable delay results in his getting the money ?-Yes.
- 55 Q. Do you think the rate of interest requires reduc-
- 56. Q. (Mr. Rajaratna Mudaliar.)—The rate of interest is 61 per cent.?—Yes, that is fair.
- 57. Q. (Mr. Muir-Mackenzie.)—Is there room for extension of well irrigation?—Yes.
- 58. Q. Where in the Patas Dietrict?—My answer would apply to the six districts in which I have been. There is a great deal of room.
- 59. Q. What prevonts it extending now?-Want of monoy; want of enterprise; want of knowledge.
- 60. Q. Is want of capital the reason why irrigation does not extend?-Yos, that is one reason.
- 61. Q. The President asked you whother a cess would be cheerfully acquissed in if irrigation works were introduced. I don t think the President meant a general water-rate or cess on the land; there would be no objection to such a cross r-No, not on the land that benefitted.
- 62. Q. Would they be willing to pay revenue even in a year when they did not require water?—Yes, because prices would be raised in a famino year.
- 63. Q With regard to the management by District Boards of irrigation works, you don't think that would occasion a certain amount of delay !- Not noncessarily. In case of emergency the Listrict Board can pass orders in anticipation of sauction.
- 64. Q. le not the action of the Dietrict Boarde merely the action of the Collector ?-Not now.
- 65. Q. le an intelligent interest vory general?-Now it is becoming very general in Bengal.
- .66. Q. (Mr. Rajaratna Mudaliar.)—In the Pusish we hal evidence that the District Board management was a sailue. What reason bave you for believing that the Board management will be botter in these provinces?—I am not aware of the state of affairs in the Pusjab. I am humbly of opinion that the people take more interest in their affairs here, and if they get a good Coloctor, the mensure will be hailed with delight.
- 67. Q. Will they have the time to do it; they have dispensarice, schools, etc., already ?—Yes, plenty.
- 68. Q. Under your permanent cettlement what scope is there for interference by the District Board P-I'ho District Buards have already interfered by imposing a cess for roade
- 69. Q. I don't yot understand what scope there is for interference by the District Buarde?—I am also a zamindar myself; I am not speaking as a Government officer. I myself would not countenance the interference of Government in the imposition of a road cess. The same way when the zamindars find they are benefitted by protective irrigation works I don't think they will begrudge the amount of cess psychle for the land protected or benefitted. Where I receive renie in kind I would willingly pay myself; whore I receive them in each I would demur.
- 70. Q. In what way would the interference of the District Board be beneficial to the zamindar?—At present a man may construct a dam and prevout those further down from

- benefitting. If the Collector has to decide where to construct the dam, he will place it where both A and B can
- 71. Q. Cannot the zamindar bimself do'it in negotia-tion with the riparian rayate?—There will be jealousies and brawls.
- 72. Q. Do you think the District Board will he able manage without some increase of establishment?— That is a large question.
- 73. Q. In some of the papers we have found that rayats do not take water even if the canel is there. Has that ever happened in the course of your experience?—Very rarely. Water is often taken claudestinely and the irregation not shown in the returns.
  - 74. Q. Water is taken and not paid for ?- Yes.
  - 75. Q. Ie that carried on to a very large extent ?-No.
- 76. Q. Have you any agency for efficient sapervision?-Yes, but it is done claudestinely.
- 77. Q. Under your system the measurement and assessment on irrigated land is done by canal officers. Do you think it would be more efficient if that were transferred to the Revenue Department?—I agree with you that it would be more efficient
  - 78. Q. Would it be cheaper ?- I think it would.
- 79. Q. With regard to the construction of wells and . reservoirs, is there much scope for it in the districts in which you have served?—Yes, very much.
- 80. Q. Are there any facilities for zamindars or toaants to construct these works?—No.
- 81. Q. What facilities would you offer !- I would make advancee.
- 82. Q. Is there any difficulty on the part of the zamia
- 83. Q. If the law were amended?—Then with great delight the zamindars would pay as many cesses as you
- 84 Q. Cas an occapancy tenant construct a reservoir on his own estate?—Yes.
- 85. Q. The zamindar cannot come down upon him and fleece him?--No.
- 85. Q. As regards takavi, can you not take money with you and disburse it even now as the system exists?—There is nothing against it.
- 87 Q. You can draw bille and take a few hundred rapees -No. es; fresh legislation is not required for that 'purpose P
- 88. Q. (Mr. Allen.) You know Bhabus Sub-division? Yes,
- 89. Q. And you know the area is Shahahad irrigated from the Sone Casal. Can you compare the area before it was irrigated with Bhahna?—I don't remember what the area was like before irrigation.
- 90. Q. Is it your opinion from what you know of Bhabua that people would take water if it was provided !—Yes.
- 91. Q. Why?—I have seen in other places where irrigation works have been started and facilities given that they tako wator.
- 92. Q. Do you think water is badly needed there?—Yes, if you get water from Kammassa people will take it.
- 93. Q. Would they be willing to pay a war eimiler to that now made on the Sone Canal?—Yes. water-rate

WITNESS No. 3.-ME. E. MYLNE, Zaminder, Shahabad.

Mr. E. Mylne 24 Oct. 02. 1. Q. (The President.)—You have got great experience of this part of the country. You have known it for a number of years?—Yes. Since 1872.

2. Q. You have seen the whole rise and growth of the Sono Canal?—Yes. I have seen the henefits also.

3. Q. And you know the Bhahua Sub-division?—Yes, I know it very well.

A. O. You made a proposition or records the imination.

4. Q. You made a proposition as regards the irrigation of rice from five weirs?—Yes, that was is the year 1897 when we had famine.

5. Q. There was a note of Mr. Bookley's on the subject. I dare say you know all shout it?—Yes. I know all shout

6. Q. Have you any personal knowledge of the proposal for a big reservoir on the Karmanassa?—The proposal was made some years ago, about 1897, when I had charge of a large number of villagee in the place. It was shout 1897 when the people there were famine-stricken, and it was then that many zamindars came forward and begged me to say if we say that the people when the people were the proposed to the say of the say of the same forward and begged me to then that many xamindars came forward and orgged me to see if we could not by some means or another make use of the water running to waste; and seeing that the people there were, practically speaking, destitute, and seeing that the water was going waste, the natural forling was thet something should be done.

7. Q. You must have known Mr. Levinge very well?—

- 8. Q. Do you remember his talking about this big reservoir ?-Yes.
- 9. Q. The scheme, as far as I understand it, has not been thoroughly gone into scientifically ?—What is the use? We do not know what water is really available.
- 10. Q. And, as I understand, the crucial time is the watering from the 20th September to the 20th of October in the halia?—If you don't get water, then, practically speaking, work is useless, because one irrigation new brings the rice on when it is in the ear; and if we have no water new, then, practically speaking, rice from being 16 annay ran down to 4 annas.
- 11. Q. So that any irrigation scheme to be useful must give water in the katia ?—That is a sine qua uon.
- 12. Q. I undorstand that in your particular Sub-division (Bhabua) that supply is deficient?—Practically speaking, there is no irrigation there; the raysts are ulserably poor, and the estates are subdivided among so many ramindars, and some of them are so involved that there is no incentive for them to do anything.
- 13. Q. Bhabna is the same as the Sone tract was before 1678?—Precisely the same.
- 14. Q. Is there any well irrigation ?-Rayats have no mency for well irrigation.
- 15. Q. In rice irrigated on wells ? No Well, you may do it. A strong rayat does it.
- 16. Q. Is the country now a paddy country?—Bhahua is a country that will grow anything. It is very fine soil.
- 17. Q. Having this uncertainty about water, do the inhabitants turn to anything else i—What can they turn to? They are practically agriculturists, and there are large areas lying fallow simply for want of irrigation.
- 18. Q. Would it not be easy to device a system of giving takari advances to help them to make wells f—Well, the question is that in one village there may be 20 landholders, and which of them are you goinglto advance to? Then ugain mother difficulty about advance is that there is no security. The rayate are in such a miserable condition that no banias will advance them money.
- 19. Q. Are thore no big zamindars?—There are, practically speaking, four big zamindars, who own from 50 to 100 villages. Then again the Maharnja of Benares has estates there. It was he wlo was on the point of bunding the Karamases at his own cost, and we heard of that nud reported the matter to Mr. Bunraillon, and said that if that were done, Shahabad would not get water. Thereupon he wrote to the Commissioner of Benares There must have been something in it, if a man like Benares would rick his money on it.
- 20. Q. Supposing we are told that the Karamasas scheme is too expensive and is impracticable, why should not there be extensive well irrigation?—The hhadi system prevents this. The tenants will not make 2) mannes per bigha If they can help it, because half will go to the zamludar.
- 21. Q. Would ramindars take takani advances?—There is no incentive for the zamindar under Act 10 of 1685 to make any improrements, breause, practically speaking, enhancement has ceased. It is hedged round with such great difficultly state no ramindar will go in for improvements, because he knows thoro will be no return, and yet improvements are possible.
- 22. Q. It seems to be a curious deadlock if improvements are possible, and yet it does not pay any person to make them?—It pays a rayat if he is perfectly sound in his tenure.
- 23. Q. If he is a permanent rayat, would be take a taken advance?—Possibly he may, but then you see he has got in go to the Collector.
- 24. Q. I am supposing that the Collector gnes to him?— Then it might suit him to do so.
- 25. Q. You are quite well aware that large areas la India are irrigated by wells?—Possibly, but you see where you may lay on cauni water, wells rease.
- 26. Q. To go back to the Karminnassa scheme, I should like to know whether you think that any water stored there would be gladly availed of ?—No doubt.
- 27. Q. And would it be taken every year?- Yes, as in the Sone Canal.
- 28. Q. We have found in other places that seven years ont of ten nobinly wants the water. That has not been my experience in Shahabad, and that has been since 1872. Before that the area was then only limited; now it has been increased by the volume of water.

- 29. Q. (Mr.: Muir. Mackenzie.) You find the water useful every year practically P-Yes.
- 30. Q. (The President.)—Has there been any serious charge brought against the irrigation of Shahabad? I mean has fever been produced by it?—No, I don't think so.
- 31. Q. There was a notion that irrigation had increased the feverishness of the district?—That has not been my experience. The sub-sail drainage here is reay good; and if you go down 10 or 12 or 15 feet, you get into pebbly sand, and there is no case of water-logging that I know of. The drainage is very good.
- 83. Q. Have you any suggestions to make for the improvement of the administration?—No. I think things are working very smoothly. I don't think we can do any better.
- 33. Q. Is navigation very valuable to the district?—I don't think so. I think it was a mistake to have made these canals navigable at all. It was a mistake in the beginning, but we sll lanke mistakes.
- 31. Q. Even before the railway was introduced, navigation was not doing much service?—I don't think it amounted to much. Now that we have this other railway, the Gya-Mogulecrai Railway, navigation is still less required. I don't think the canals, as far as anylgation goes, pay in the district.
- 95. Q. (Mr. Muir-Muckenzie.)—I understand you to say that the bhavli tenure sots on obslacle to the undertaking of improvements by the rayat?—Yes, most distinctly.
- 36. Q. I don't quite understand why with the bhaoli tenuro there is no incentive in improvement by the ramindar. He will got an cubanced share of produce?—Yes, the zamindar makes the improvement, but it rests with the myst whether he will turn out a good crop or not, so that he is at the mercy of the rayat.
- 27. Q. And the rayat will not make proper use of the improvement?—No.
- 38. Q. On the other hand, with the naldi system you think the rayat will have some incentive to improvement?—Yes, provided he is an occupancy myst.
- 39. Q. And the zamindar will not ?-Certainly not. The Tenancy Act has stopped enhancement.
- 40. Q. There is one provision in the Tennney Act by which, if an improvement is made by the landlord, and at his expense, he is slowed to enhance the rent?—I think it is about 10 per cent. It is not very much. It is nervy small enhancement. I am not sure, but I think it is about that. The incentive to the ramindar is so little that I think I no right in saying that no ramindar will spend money in improving the status of the rayat.
- 41. Q. Then you consider that the Tenancy Act, even with that provision, has not enabled the raminder to take enhancements P—No. It is so hedged with difficulties. You have gut to go to the Civil Court before you get any enhancement, and that means, of course, money.
- 42. Q. There is no power to go to the Revenue Authorithe?—No, none. In fact, that Act has alienated the zamindar from the rayat. In the old days the zamindar and rayat were everywhere in a sort of partnership; now the zamindar says: "Why should I spend money on improvements; what is the good?" and I think he is quite right. There ought to be some incentive for him.
- 43. Q. Do you think that private works of irrigation might be more extended by more liberal advances of money ('alaci) by tinvernment?—I don't quite follow you. What do you mean by private?
- 41. Q. I mean such thinga as wells, ahars, etc.?—In that case you will have to deal with the rayat.
- 45. Q. Do you think the raynt would undertake more of these works if he had more money placed at his disposal by Government?—I don't think so.
- 46. Q. Why not?—Woll, you see, if a mad borrows from Government, he has a very haly drend of what will impren to him if he does not pay up. He may get round his makajun and put him off, but he cannot get round Government.
- 47. Q. You mean the system is too rigid ?—Yes.

  48. Q. (The President.)—Do you think you might have greater facilities given for leading monog?—Well, that question was once thought of in the Simbabad Division, but the difficulty was to get the rayat to go to the Coll ctor for money.
- 40. Q. If the Collector or a special officer went about with a bag of supers in his pocket?—Well, if he paid the anyat, the rayat would have to pay somebody else scener or later.

Mr. E. Mylne.

24 Oct. 02.

Mr. E. Mylne. 21 Oct. 02.

- 50. Q. Haw da yau mean?—I mean to say the Collector would give a rayat money, and the rayat would have to make payments by instalments and things like that, which is harassing. With Gavernment you have many channels to go through before you get to the Collector.
- 51. Q. Supposing this is simplified?—There is always a disinclination for a rayat to ga to the Government for maney. I don't know why it is, but he has got an ungodly dread of doing so. If anything is done in regard to these irrigation cohemes, where it is possible it ongot to be dane by Government.
- 52. Q. (Mr. Muir-Mackenzie.)—That is for the big ones; but as regards the small ones, would you have Government undertake them too ?—Lthink the only thing is for Gavernment to take up the construction of small works.
- 53. Q. In other parts of India vory large sums of money are taken by rayats ?—They do so have with apium advances. They also take money to make wells, but that is not very generally reserted to.
- 54. Q. Why chauld there he mare repugnance here than alsewhere ?—I dan't knaw, but it is so.
- (Mr. Allon.)—The Opium Dapartment da advance money but it is very sparingly taken?
- (Witness.)—Of course you have to remember the haldings in Shahabad and Biharsre vary small, comparatively speaking. Yau wan't have a man having 50 acres of a halding.
- 55. Q. (Mr. Muir-Mackenzie.)—In some parts there are a cansidorable number of wells !—Yes.
- 56. Q. Do you think these wells are made with borrowed manay?—Possibly these wells are made with borrowed money, hat it requires a very strong rayat to make a well.
- 57. Q. What is the district with which you are most familiar P-Shahahad.
- 58. Q. And haw deep are welle there?—They run from 20 to 60 feet. The average depth may be taken at about 40 fest.
- 59. Q. And what sort of wolls are they ?-All sorts of wells.
- 60. Q. What is the motbod of construction generally P—Well, they have olther to make it pakka with lime and mortar, or simply with two rows of bricks.
- 61. Q. What is the cost of construction of a pakka well?—Well, it should run from Re. 100 to Rs. 150.
- 62. Q You mean with lime and mortar?-No, that would cost mare.
- 63. Q. Then what you mean; is that a kacheha well costs from Re. 100 to Rs. 160?—Yes.
  - 64. Q. A pakka well would cost much more ?-Yes.
- 65. Q. How much more? Would it run to Rs. 1,000?—Na. It would cost probably double the cost of a kachcha well.
- 66. Q. Would that be a dauble mat woll?—Yes. There are one mot wells here, two mat and four mot ones. I am talking of a twa mat well.
- 67. Q. How much would that well irrigate ?-20 to 25 bighas.
- 68. Q. A bigha being how much ?- 5ths of an aerc.
- 69. Q. With what sort of crap ?—A mixed crop, i.e., rabi, sugaroane, rice.
- 70. Q. (Mr. Allen.)—What do yan say is the area irrigated by a woll?—About 20 to 25 bighas.
  - 71. Q. All the year round ?- Yes.
- 72. Q. There is an extraordinary variation in the areas in different parts of Indus?—Yes. Even in Shahabad there is a great variation. In some places water is found very near the surface; in other places you get it very low down.
- 73. Q. You have been speaking of a two mat well?— Yes. It does not pay a man to make a one mot well.
- 74. Q. (Mr. Muir-Mackensic.)—Have you any experience of the total amount of unirrigated sugarcane?—This is not known in Shahabad. It is not heard of.
  - 75. Q. You are not nwere of it?—No.
- 76. Q. (Mr. Rajaratna Mudaliar.)—What is the size of these twa mot wells?—Well, I enppase about 6 or 7 feet in diameter.
- 77. Q. You said that in the case of the Sone Canals, south of Patna, the water-rate is paid by the tenants. Don't you

- think whore a zamindar gots an enhanced share of the produce, he should pay a proportion of the water-rate?—But where does he get an enhanced share of the produce?
- 78. Q. The tonant divides the praduce with the zamindar?—That is under the bhaoli system. In Shahabad bhaoli is an exception.
- 79. Q. Where there is the bhaoli system, should not the zamindar ply a share of the water-rate?—As I have already said, there is no incentive to a zamindar to do that.
- 80. Q. Supposing Government constructs a canal in Bhahus, who will pay the water-rate?—The rayat who uses the water.
- 81. Q. And the zamindar will get an enhanced share af the produce?—He will take his chance of gotting that share or not.
- sanare or not.

  62. Q. Will not Govornment be justified in levying a portion of the water-rate from him also ?—They will never agree to that. Yau see it would be a compulsary cess, ands the zamiudars will be up in arms at once, because it mean, another Gavernment revenua. Many years aga, I think it was in 1870, there was a talk of a compalsory cess on the land-owner, but it was quickly drapped.
- 83. Q. Yan cannot call this a campulsory cess. Gevornment gives you water and enables you to levy an enhanced share of the produce from the rayat?—Supposing the zamindar does not want the water, then it is comenlary.
- 84. Q. But tenants may want it?-Then the tenants should pay for it.
- 85. Q. Under the share system a zamindar gets half the produce of his tonant, which is much mare with irrigation than without irrigation?—Yes, hat as I said befare, the enhancement of the crops lies entirely in the hands of the rayst. Supposing he will not cultivate, where is the remedy?
- 86. Q. So long as he pays the water-rate he will take care to reimhurse himself?—That is a supposition, but I don't think the question of compulsory area will come in at all. If the schemes you epeak of could be possible, the rayats themselves would willingly take the water and pay the present case now paid on the Sane Canal.
- 87. Q. The difficulty only arises under the sharing system ?-That would right itself in time.
- BS. Q. (The President.)—Has that system decreased since the Sone Canals have been in operation—I mean the bhacki system ?—Yes, it will settle itself. The raynt himself now under the law can go to the Collector and commute his bhacki into nakdi, so that if the water came, I am sure he wanld go to the Callector and say "I want my bhacki made into nakdi.
- 89. Q. Is it within your knawledge that bhacli has come to an end in the irrigated area?—Yes, bhacli has ceased.
- 90. Q. Mr. Ram Narnyan Singh suggested that the District Board might take aver the management of the irrigation warks. What is your opinion upon that point?—We could not dati better than it is done by the irrigation officers. Why saddle the District Board with this? They have enough to do with reads, dispensaries and schools; why saddle them with these minar schemes of irrigation?
- 91. Q. (Mr. Muir-Mackenzie.)—Yau said that there was a very full demand for all the water that the Sone Canal could give?—Yee.
  - 92. Q. At present rates ?-Yes.
- 93. Q. Da you think that Government would be justified in taking any higher rates?—Well, Government have just dene that. They have added on five annas a bigha.
- 94. Q. Yau think they have gone as high as they ought to ga?—I would not like to say that. I believe a very much larger area can be irrigated than is being-irrigated
- 95. Q. Do yau think water is wasted?—Well, I would not say that. It is improvidently used by the rayat. It would go a very much langer distance if it were carefully used. They naw damage their awn crops by the abuse of water.
- 96. Q. Hava you any idea as ta how it could be regalated?
  —'That brings in the question of irrigation channels, and
  that also brings in the question to wham should those
  channels belong—whether to the zamindar or to Government. If the subsidiary channels belong to Government, it
  would add very much more work to the irrigation officers
  but I believe a good deal more irrigation could be attained.

Of course, so far as we know, at least that is my personal opinion, that the duty of the water has not reached its maximum owing of course to the distribution which will be learnt in time.

- 97. Q. What facilities do you think a landlord ought to have to enable him to got an enhancement in respect of an improvement executed by him?—Well, I think there should be some inexpensive method through the Revenae Authorities or the Collector, whereby he should get a fair return of the capital sunk by him in improvements.
- 98. Q. Would you like the Revenue officer to estimate the value of the improvement and what increased rent it would be justifiable to charge in respect of it P—Yes, something to avoid assless litigation and costs.

99. Q. You mean a more summary remedy ?—Yes, and a summary remedy which would give the zamindar an incentive to sink money, and they would do it if they could; but now you will not get any zamindar to spead a courie on improvements. Now, if he spends any money on improvements, he has to go to the Civil Coart for onhancement of rent, and when he gets it, it is a very small return for the money he has speat.

the money he has speat.

100. Q. Do you think he would get a better return from the Revenus officer P—He would get more oven justice. The Revenue efficer could see what the land could give and estimate the value of the improvements and then fix the amount of cahancoment. Now one has to go to the Civil Court, and then you are not sare of what you are going to get, or whether you will get any return on the money you lay out on improvement.

Mr. R. Mylne. 24 Oct. 02.

# WITNESS No. 4.—Ma. S. Shabafuddin, Barrister-at-Law and Zamindar.

- 1. Q. (The President.)—You are, I understand, a barrister ?—Yes.
  - 2. Q. And you are also a land-owner P-Yos.
- 3. Q. Have you been resident here for a long time?—I was been here, or rather a few miles from here, so it is my home.
- 4. Q. You have soon all the changes that have been brought about by the introduction of the Sone Canals ? You have lands here?—Mostly in Shahebad.
- 5. Q. Is your opinion in favour of the irrigation that has been done? Has it been a boon to the country?—Entirely so. I am entirely in favour of the irrigation done.
- G. Q. Do you think, if water could be found, it would be desirable to extend it?—I should think so. In 1872 or 1873, before the introduction of the Sone Canal, the property that I now hold with some of the shareholders fetched about 14s. 8,000 a year. Now, after the introduction of the Sone Canal and after the improvements we have made on the property, the highest income that we have got hus been like 23,000.
- 7. Q. Do your tonants pay bhaoli or nakdi?—In the mauzaha I am interested in it is all bhaoli, except of course for sugarcane and poppy, for which we generally get nakdi. In Patna and Gya the bhaoli system mostly prevails.
- 8. Q. Ilave you anything to suggest in the way of extending irrigation in Patna !—That requires a scientific knowledge.
- 9. Q. What would you say ? There is, I understand, a great deal of irrigation done by the streams which come down from the Gya kills?—Minor irrigation.
- 10. Q. Is that satisfactory?—Well, to some extent it is.
- 11. Q. I suppose it is very ancient and done for a long time?—A very long time.
- 12. Q. Does it work satisfactorily, or is there any improvement wanted there?—Improvements are wanted no doubt in the shape of repairing the old pains, throwing up earthworks and bringing water, and then owing to the change of the course of its streams it has become necessary to dig out new pains.
- 18. Q. That is, I suppose, because the subject has not been scientifically treated !--Quite se, Sir.
- 14. Q. These pains are the property of the zamindars who reap the benefit from them mostly ?—No douts, and of course in olden times they had not much knowledge.
- 15. Q. Do they now omploy professional advice !- Very seldom.
- 16. Q. Are there any engineers making their liveliheeds by assisting zamindars la such eases?—Since we have get a surveying school here we pass out a good many candidates as surveyors and everseers, who are doing some good to the centry by giving advice to the zamindars, but these instances are not general.
- 17. Q. But there is not a livelihood to be made from it. If an engineer settled in Pataa, who was known as a good professional man, would be be able to make a livelihood out of it?—I don't think so.
- 18. Q. We have heard complaints made of the disputes upon these pains and the inconvenience of having to take them before the Civil Courts. Do you think there is any

- remedy to be found for it in legislation? Have you anything to suggest to make that easier ?—I think legislation Sharafuddin, in this respect would certainly be a boon to the country.
- 10. Q. In what direction would you legislate?—In order that there should be facility in leading water to a place where at present they don't get any water.
- 20. Q. That is, passing the water through the lands of another man?—Yes, Sir. There should be a system of land acquisition for the purpose of small chaesels to be taken to private property.
- 21. Q. That does not exist in the pains ?-I don't think there is any instance that may be quoted in this district.
- 22. Q. Would there be any advantage in strengthening the anthority of the Collector of the District by glving him anthority to settle disputes?—That would be an easier way than going to the Civil Court,
- 23. Q. Would that be a popular way ?-It ought to be.
- 24. Q. Would it be?—I don't think it would be very popular, but it ought to be. You see the people are so very conservative. They want to fell book to their old system. If a new thing were to be introduced, they all fly from it. They don't like any innovation.
- 25. Q. Do you know the Bhabua Snb-division in Shahabad?—No. I have been there only once.
- 26. Q. (Alr. Muir-Mackenzie.)—Can you tell mowhy it is that the bhacti rents on your estate have not been commuted, while there is such a tendency in the Shahabed District towards commutation?—I think by having the bhacti system in this part of the country there is protection given both to the zamindars and to the rayats in seasons of scarcity of water.
- 27. Q. Yes, but then I suppose the same arguments would apply in the Shahabad District; would it act?—There is a difference there; they have got the Sene Canals.
- 28. Q. I thought you said you bad the Sone Canals too ?— No, only some few distributaries just at the extreme end of the Patua District.
- 29. Q. How is it you have succeeded in maintaining the bhaoli system on your estate?—In the first place, I have to pay about Rs. 2,000 a year for the water that I take to my village in the Sbahabad District. I don't trouble the tenants; I pay it all myself and by easy instalments; I realise from my tonants half of it. That may be one of the reasons.
- 80. Q. (Mr. Rajaratna Mudaliar.)—You take also half the water-rate?—Yes, but I do that by very easy instalments.
- 31. Q. (The President.)—Are the water-rates high?—I don't think so—I mean to say, comparing the produce we get, they are not high at all.
- 32. Q. (Mr. Allen.)—Is it common for landlords to pay half the water-rates P—I think there are only one or two exceptions that do it. There are very few who do it. Although there is a rule of a cortain commission being allowed to zamindars if they realise it from the tonasts and pay it to Government, but very few do it. I, as a raminder, Ipay my own rates, and also realise them from the tenants.
- 33. Q. (Mr. Muir-Mackenzie.)—Would you say this that, where the bhacli system exists, a zamindar last considerable facentive to improve his lands P—No doubt.

. .

#### WITNESS No. 5 .- MR. F. AINELIE, Suh-divisional Officer of Bihar.

- Mr. 1. Q. (The President.)—Have you been long here?—F. Ainslie. About ten months.
- 2. Q. And where were you before?-Monghyr wes the 21 Oct. 02. last place.
  - 3. Q. Have you any irrigation in the Sub-division?— We have irrigation by pains throughout the Sub-division.
  - 4. Q. Your streams come down from the Chota Nagpur hille, I presume?—Our rivers all come from the Gya Dis-
  - 5. Q. Is there much trauble in the management of those pains?—On the whole it goes smoothly.
  - 6. Q. Do you think legislation is decimble?—I think it is nesosary. I have seen several cases in which there are several co-shurers in a village where some of them will not do their daty in regard to repairing water channels, and in those villages the irrigation is not whot it should he.
    - 7. Q. That is, the rayats?-Ne, among the zamindare.
  - 8. Q. What do you propose?—To place all pains under the Collector we have some Government estates in which we have only u chare of the village, and we find some difficulty in getting our co-sharers to do their daty. Of course we are in a hetter position than other zamindars, and we can do their work and call upon them to pay their share, but even then we find a difficulty.
  - 9. Q. Would you give the Collector cammary powers?—Certainly.
  - 10. Q. Among works required to be kept in order, de you include the clearance of pains and repairs of ahars?—Yes,

and alangs too; they are emhankments for keeping in the water, as the pains, as a rale, are not very doep. If the alang were not there, the water would overflow.

- 11. Q. These pains are of very varying size, I euppose?

  —Ye, none of them are very hig. I have crossed one in the rains several times, and I have never seen it more than neck-deep. And it vie out of the common. And it would be about 50 feet wide. That
- 12. Q. Do not these pains occasionally got out of order and do mischiel?—No, they do not do muon mischiel. If the people find too much water coming into the pain, they put up an embaakmeat at the mouth of it; it is very easy to close it.
- 13. Q. What is your opinion us to giving advances for private irrigation works?—So far as the Bihar Suh-division is coocerned, the rayats would not he willing. They look to the zamindar as the proper person to make and keep up
- 14. Q. Does the zamindar ever take it up?—Sometimes, bat he is diffident.
- 15. Q. Do you think the District Boards could profitably control the irrigotion works?—I think not; it is out of their province.
- 16. Q. (Mr. Muir-Mackenzie.)—Have you the power to grant advances?—I had during the famine of 1897 in the Gobladpar Sah-division of the Manhhum District. I do not know whether I have the power now. I have given one or two loans for cattle, seed and agricoltaral implements, but not for irrigational purposes in my present subdivision. division.

# WITKESS No. 6 .- MR. A. OGILVY, Manager, Court of Warde, Gya.

Mr. 1. Q. (The President.)—I managed the Tikari Raj in A. Ogilty. tha Gya District for 16th years.

24 Oct. 02.

- 2. Q. Is Gya a district in which there is any urgent need of irrigation?—It is dependent entirely on irrigation. The works are protective and are necessary for the rice. The works are protected and are necessity for the rect.

  I have known only one year in which irrigatian works were absolutely disregarded. There are ahars for the protected portion, pains for the immune portion.

  I remember only one year in which the pains failed. As a rule, there is always enough to cave the rice. The pains depend on the rains from the Chota Nagpur slopes.
- 3. Q. Are these counted on as infallible?—Yes, and there is elways a large percolation going ou, even if the river hed is dry.
- 4, Q. You say the district doponds altogether on irrigation. If the irrigation were to stop, would the people take to dry crops?—To a certain extent.
- 5. Q. Does the rabi form any appreciable part of the cultivation of the district P-Wo used to calculate about eix annas of rabi and ten of rice.
- 6. Q. Is legislation desirable as regards the maintenance of these pains?—It is desirable for the construction of pains; the Collector ought to have power to acquire lands, where necessary, for the construction of a pain which he may think is for the common good.
  - 7. Q. Has he not that naw ?-I think nat.
- 8. Q. What is your feeling about the imposition of a water aces upon laads protected by works coastracted by Government?—I don't think it necessary for Gya, hecause these irrigation works or not purely protective. They are re-productive; very mach so. The zamindars would jamp at any help or idea of co-operation from Government.
- 9. Q. Do wells bear any part in it?—Very slight; they are only used for poppy and sugarcane.
- 10. Q. Havo you much experience of takavi advances?
  Only in the Raj, and that was not for improvements, only for distress.
- 11. Q. (Mr. Muir-Mackenzie.) Whot rate of interest did you charge ?-Nothing.
- and you charge r—Nothing.

  12. Q. (The President)—Now you are at Chupra. Is that as dependent on irrigation as Gyn?—Not assily. The works are not remunerative as they ore in Gya; that conditions are different: Gya has a tremendous slope and Chapra next to uone. In Gyn the water can be laid ou practically where you want it. In Chupra it is a matter of difficulty.
- 13. Q. Are the seasons more favourable in Chupra than in Gya?—The rainfall does not differ very much,

but the district being flatter, the rainfell goes further. In Gya the alope is so great that without works the rainfall goes off at once. That is the distinctive feature of Gya.

- 14. Q. It makes it all the more remarkable to me that these pains can be administered and controlled without some technical knowledge?—When they are first constructed, I have no daabt the levels are faulty, but they very soon correct themselves.
- 15. Q. (Sir Thomas Higham.)—Have you ever constructed any new pains in connection with the Wards estales?—Yes, about half a mile of a pain was washed away and we had to make practically a new work.
- 16. Q. And was that entirely for the benefit of the Wards estates P—Yee, but there were one or two other villages which got the benefit equally with ac.
- 17. Q. Did they help at all? We had to eas them for contribution.
- 18. Q. Have you found the expenditure an each works productive P-Tremendonsly.
- 19. Q. It gives you a good retarn?—Immediately. You may calculate on SO per cent.
- 20. Q. That does not indace the private owner to extend them P.—They cannot extand them, because they cannot got the necessary land.
- 21. Q. Some of these pains which irrigala the Wards extatas also irrigata a great many other estates P—When they were originally made they were made by the Tikari Raj, and all the vulages originally belooged to the Tikari Raj. Some have passed away out of the estate and others may have been given away as jagire.
- 22. Q. Do you find any diffically in getting what you want done on them owing to other partners?—In the Tekeri Raj the management of these pains has all been recorded in an irrigation book which is now such ancient history that it is accepted by everybody, and within the limits of the recorded righte of each villago there is no very great difficulty arising. very great difficulty arising.
- 23. Q. You mast have one controlling body, there is no doubt of it?—I sometimes have to take a strong hand.
  - 24. Q. Personal inflaence, I suppose?-Yes.
- 25. Q. (Mr. Muir-Mackenzie.)-What was the result to the orops in that year when the pains failed ?-We lost very largely in the villages that were served by pains, hat, cariously enough, the villages that were served by chars only had a better crop that year.
- 26. Q. Can you ascount for it?—The villages served by pains did not keep enough abars—enough atorage.

Mr

A. Ogilvy. 24 Oct. 02.

- 27. Q. If they were kept up in connection with the pains, that night be an advantage?—It is difficult to get the room. As a rule, there is so space for it. It would practically mean taking land out of more profitable cultivation, and with the cost of the extra storage it would not be mathy while. be worth while.
- 28. Q. And what measures did you take when the pains failed ?—We could do nothing.
- 29. Q. You did not dig into the rivers ?-We worked them as long as we could get anything out of the river.
- 30. Q. Have you made many wells?—Yes, a great many in Tikari, but they are very expensive. I remember ooo oost Rs. 1,300. It was 70 feet dry. It was not for irrigation.
- 31. Q. But do you make many wells for irrigational purposes ?—Not so many; a few.
- 32. Q. What did they cost you—say, a well with two mots?—Vory few mots are used io Gya District; all

levers. It depends entirely on the situation. Close to the river bank it might be made very cheaply; a kachcha woll could be done for Re. 80 or Rs. 90, and a pakka well for Rs. 200, brick-lined.

33. Q. And on the higher land do you have to go through rock ?—No, but very hard clay, generally about 40 feet. That would cost for a pakka well four or five hundred rupees. We should not make these for irrigation purposes.

84. Q. And what have you grown with them P—Chiefly sugarcane, specially valuable crops. We should not make them merely for rabi.

25. Q. (Mr. Rajaratna Mudaliar.)—Who keeps the pains ia repair?—The Raj kept the pains io repair on its own estate.

35. Q. Did the villages contribute any labour ?—The only labour the villages contributed, which is termed goans, was merely as much work as they could do with shoir hands or some rough instrument, not using kodalis.

#### WITNESS No. 7.-MB. S. M. NASIAUDDIN, Snb-divisional Officer, Jahanabad, Gya.

- 1. Q. (The President.)-I have been bero over two
- 2. Q. Yon were on the Sono Canal?—Yes. My duty was to collect the water-rates in the districts of Shahabad, Patna and Gya. I was over six years occupied in that work; and during that time the revenue gradually increased. When there was scanty rainfall the canal revenue increased, and when there was plenty of rainfall less canal water had to be appointed. had to be supplied.
- 3. Q. If the Sone Cauals had double the water they have, would you have gone on increasing in the same way in revenue. Was there always a demand for water?—I think so; in the beginning we should have made it of more
- 4. Q. But if there is no more water in the river ?—If Sone gave us more water, we could double the quantity.
  - 5. Q. All the water was consumed?-Yes.
- 6. Q. Was there any complaint made of the water-rates being too high?—They were always complaining whether it was right for them to complain or not.
- 7. Q. The rates were raised?—Yee, more than once; but they paid every pice of it. The Sone revenue has been cellected cent. per cent.
- 8. Q. But it has never paid interest on the capital expended on it. Would it be fair to lay a cess upon the whole district, because the people were saved from famine, whether they took water or not?—It would be fair, but the people would not willingly accept it.
- 9. Q. Was the navigation much oppreciated on the Sone Canals?—No. Since the opening of the railway it has been entirely abandoned.
- 10. Q. Would it have otherwise increased ?been having fresh and better roads, and I think people would have employed bullock earts rather than boats.
- 11. Q. Do you know the Bhabua Sub-division of Shab-bad?—I did not have charge of it; hut as Deputy · Collector, I had to deal with part of it.
- 12. Q. In your position as Deputy Collector of the Sone Canals had you acything to do with the measurement of the crop ?—No, that was done by the Public Works Depart-
- 13. Q. (Mr. Muir-Mackenzie.) Had you anything to do with the granting of remissions?—Only in the case where items were "irrecoverable." When my procedure by cortificate failed I had powor to remit.
- 14. Q. (The President.)—Supposing you have a katauni to collect revenue, and the mau says "I never had water; it is a mistako"? Where did he take his complaint?—To the Executive Engineer or Collector.
- 15. Q. Do you think the system worked well?-Very well.
- 16. Q. There were no complaints that the Executive Engineers were too harsh?—No. Where wastage rate was charged, it was discretionary to impose the maximum or the iotermediate rate.
- 17. Q. Did-they often appeal from the Executivo Engineer to the Collector?—Not often.

- 18. Q. Can you suggest any improvement in the adminis- Mr. S. M. tration of the works of the Sone Canals to make them do Nasiruddin. their function better than they do now ?-I think it works as well as it ought to do. There is a season when water is allowed to escape from the canals. It goes away for nothing. Why not let it go somewhere, say, in ahars or tanks, to be used for drinking or for irrigation inetead of throwing it away; that is, if there were no engineering difficulties, and charge a small rate.
- 19. Q. Do they not fill village taoks when there is water to epare?—When application is made it is done.
  - 20. Q. And oharged P-I think not.
- 21. Q. Do you think that legislation is necessary for the proper control of pains?—I am strongly of opinion that legislation is necessary. I find difficulties in keeping proper control in keeping people from fights and riotings. This is exactly the season when fights do occur. I have to be always on the look-out. Say there is a pain which receives water from a certain stream. It goes on, say, a mile, and there are many other pains that take supplies from this parcot pain. Then at one place it branches off to the light hand and at the same time to the left; suppose the land of the owner on the right side is on a high lavel. the land of the owner on the right side is on a high level, and that on the left at a low level: well, the land on the right belongs to one man and the land on the left to another, then the man whose land is on the low level is always on the lock-oot to dig and deepen the branch leading to his land. By doing that, every drop of water that comes to the mouth will necessarily go on to the left hand side. Can one stop him so digging on to his own land is a question? Case law is so very donhtful about it that we have to be almost silent. The people decide the case by force, and then we have to try a case of murder or riot. A record-of-rights should be made first of all. should be made first of all.
- 22. Q. (Sir Thomas Higham.)—You think it is a pity the capacity of the Sone Canals was not increased?—Yes, provided Sone has the water.
  - 23. Q. But has it?-It is for engiaeers to say that.
- 24. Q. Engineers say the capacity of the canal is limited by what it can give doring the fifteen days in October, when every acro of rice requires water. Is their crop ruined if they don't have it?—Not exactly ruined, but the outturn would be less than it ought to he.
- 25. Q. If they can spread the irrigation over 25 days instead of 15, they could icorease the srea of irrigation in that way?—In quantity, not quality. I think more water should be given them. I do not agree with officers who charge the tonants with waste of water.
- 26. Q. Water should be given oftenser and more in quantity?—Yes.
- 27. Q. (The President.)—But if you cannot get the water out of the river P-Well, it is a pity. Old and expert tenants think more frequent watering and keeping it a little longer will improve the crop.
- 23. Q. (Sir Thomas Higham.)—How often do they get water for an aero of rice—once a week P—I cannot say, but not so often, as the onlivators apply for it.
- 28. Q. What is the rule about remissions in case of failure of supplies?—That is settled by the engineers and their orders are appealable to Collectors.

24 Oct. 02.

Mr. S. M. 30. Q. (Mr. Muir-Mackenzie.)—I anderstood your Nasiruddin. brother (Mr. Sharfuddin, Barrister-at-Luw) to say that, as zamindar, he pays the whole of the rate?—Yes, he does.

- 31. Q. Did he nudertake to do that ?—He applied under a epecial provision in the rulea for the water-rote to be paid by one contractor. He becomes the contractor and is entitled to recover a half share from the tenants. But that is only done where the zamindar is on very good terms with his tenants.
- 32. Q. He kept up the bhaoli system?—Yes. To commute the bhaoli into nakdi the ramindar will fight to have a fair each rent, and that would be rather too much for them to pay in cash; it is easier for them to pay in kind.
- 33. Q. But how do you account for the very considerable commutations that have occurred in other parts of the canal ?—The commutations have not occurred in the arca irrigated by canale. In Shahahad, as a rale, the whole district has been always nakdi, except in a few cases. In the case of my brother's property it has been bhaoli.

34. Q. (Mr. Rajaratna Mudaliar.)—What is the total amount you collect in your division?—From eight to twelve lakhs according to the water supplied.

35. Q. What etaff had you?—Two Doputy Collectors as my assistants, besides a very hig office, and the division was divided into ten circles, each with a circle officer, and for each circle officer there was n cortain number of tahsildars and peons to collect.

36. Q. What was the total cost?—It was very high, but now they have reduced it.

37. Q. Have there been many cases of charges for waste water in year time?—Not many.

38. Q. What is waste water  $\hat{r}$ —A man who has never applied for water may take water from one who has been granted it.

39. Q. Surreptitious irrigation P-Yos.

WITKESS No. 8 .- Mr. C. E. A. W. OLDHAM, Collector of Gya.

(Replies to printed questions.)

## -GENERAL.

Mr. C. E. A. N. Oldham.

1. The answers below rofer to the district of Gyn.

B. Oldham.

24 Oct. 02

As the district officer of the district for about four years,

I have toured through it in all purts and have devoted
much time to making myself acquaiated with the various methods of irrigation.

2. The statement marked "A" shows the average rainfall per menth at the bend-quarters attain of the fear sub-divisions in the district.

3. The following obstacles exist in this district.

(The answers here are independent of the arrangement of the question) :-

(1) The epaisity of population in the jungly and hilly tracts in the southern part of the district.

(2) The thriftless character of the people.

(2) The thriftess character of the people.

(3) Want of education and enlightenment among the land-helding classes, who should initiate measures for the improvement of irrigation. Owing to the general provalence of produce reats in this district end to the physical and elimotic conditions that necessitate the up-keep of artificial works of irrigation, the duty of maintaining and inaugurating irrigation works lies to a peculiar extent upon the landlords, who are, however, unfortunately so bnekward and often so blind to their own real interests that they do not undertake such works.

(4) Lack of capital for the lastial expenditure.

(4) Lack of expital for the lastial expenditure.

(5) Insufficiency of water-supply for any extensive projects due to physical conditions. The district is hounded all along the south by the high lands of the plateau of Chots Nugpur and the numerous spurs of hills that project from this plateau. The general slope of the district in from south to north towards the Ganges, and this slope is comparatively rapid. A large number of hill streams issue from these high lands and flow across the district from south to north. In the rains these are swellou torreats that carry with them quantities of gravel and floe sand that are deposited in the heds lower down. These streams are ac rapid and the beds so sandy that within a few meaths, sometimes within a few weeks, of the cossition of the rains, the beda are almost dry. The rainfall is also small, and the surface dmiaage, except where blocked and stored up in artificial reservoirs, is repidly carried off by these streams. these streame.

4. The prevniling tenure in the district is bhacli, or a system of produce reuts. Some 70 to 75 per cent. of the caltivation is held under this system. About 25 per cent. pays cash rente. The systems are not localized, or confined to partionlar tracts. Certain orops, however, are nearly always cultivated under the bhacli system, each as rice; and careful crops, each as pagent and careful crops, each as pagent and careful crops. always cultivated under the bhaoli ayatem, each as rice; and cortain crops, such as poppy and sugarcane, are invariably cultivated at each rents. But the two ayatems exist side by side all over the district. In consequence of the bhaoli system and the general ignorance of the cultivating class, the tenants are markedly sub-crivent to their landlords, and in many cases completely so. The result is that in most cases the rayats depend emirely for works of irrigation upon their landlords. Individually they have not the capital to undertake such works as the conditions of the district require; nor have they acquired sufficient self-reliance to unite among themselves for the purpose of un-dertaking any works of general otility.

The permanent settlement is in force in this district.

5. (1) to (6). The statement marked "B" shows the number of leans ander the Land Insprovement Leans Act granted during each of the past five years and the nine months of the current year. Leans are taken by the people for improving or extending the means of irrigation with fair readlness. But I am of opinion that the system of making advances under the Land Improvement and Agriculturists' Leans Acts might be considerably improved in more ways than one, and further extended in the districts of Bihar. The chief drawbacks to the existing system, which, so far as I am aware, are felt by the land-owners and raysts, are—firstly, that the leans cannot generally be given at the very time they are wanted; and, secondly, that the procedure in force permits of persons applying for leans having to pay fees to clerks and others, in order to smooth the way as they think for sametion to, and actual payment of, the amount. A system should be introduced by which sanction to the grant of advances could he more promptly given and the cash paid personally by a gazetted efficer at convenient ceatres. 5. (1) to (6). The statement marked " B " shows the numconvenient ceatres.

6. I have not found this to be se.

(a) Tide above.

(b) Seeing the great improvement effected by the Sone Canal system in the comparatively small truct served by it in this district, the more culightened classes are fully alive to the value of extended irrigation, and would welcome further extension.

#### B .- CINALS OF CONTINUOUS FLOW.

7. The only canal of continuous flow in this district is the Patna Gya Canal (Baron to Khaganl), running almost parallel to the western boundary of the Gya District. The tract served by this canal grows the ordinary crops (bhadei, winter rice and rabi).

(1) To a small extent.

(2) To a great extent. Sagarcane, petatee and poppy which could not otherwise have been grown are new grown in substitution of the ordinary food-grain crops.

(a) 15 per cent. (b) 50 per cent. (c) 75 per cent. oa srea actually irrigated.

8. I would say Rs. 10 to Rs. 15 in case (1) and Rs. 20 to Rs. 25 ia case (2).

9. (1) Rs. 3 per acre on the area actually irrigated.

(2) The custom different and interest anniharis. In the case of nakd lands an occupancy rayat pays the entire water-rate, but pays nothing extra to the malike. In the case of non-occupancy rayats it depends on the zamindar how much he takes. It depends also on the land and crop. In the case of bhacli lands the produce is divided half and half, or in such other proportion as may he customary. In bhacli lands the duty of paying the water-rate falls pri-

marily upon the tonact. Usually he prevails on his malik to pay half, or such propertion as the malik receives of the produce, but sometimes the malik decimes to pay any share.

(8) Nothing.

.. On the area actually irrigated in each case.

10. The expenditure on construction of village channels is generally incurred by land-owners, but occasionally by tenants when the land is held ander occupancy lights. The tenants have no security for recomposet—at least none is known.

11. No deterioration to the soil, or damage to people has resulted so far. The canal serves but n comparatively small tract in this district. It has rendered fortile a most unfertile tract, a large part of which was sandy and unproductive.

#### C .- CANALS OF INTERMITTENT PLOW.

[N.R.—Small treigation channels, supplied by tomporary dams throwo across a river-bod, are included under this heading.]

Under this category the pains or artificial water channels contomary in this district are considered, and the answers given below refer to these pains.

12. (1) and (2). Pains are artificial channels leading from a river, and dug out as far as the water is intended to be taken. Their width, depth and length depend, of course, on the supply of water available. The general condition of the rivers in this district has been described in a paragraph 3 (6) above. These rivers are world to the rivers. condition of the rivers in this district has been described in paragraph 3 (5) above. These rivers are impid terrouts after heavy rain, becoming swellow in a few hours perhaps, and carrying with them quantities of hard white and yellow sand from the granitic hills of the Chola Nagpur plateau, and dwindling down usually by the month of October, to nurrow little streamlots that wind a tertuous course through their broad sandy bods. The greater part of the sub-soil has been deposited by diluviou from these bills, and those of similar geological formation that food the Sone river. This accounts for the large proportion of sand in the soil, and the large areas that are covered with pure sand. Owing to the slope of the country from south to north and the large number of streams that cross it from south to Owing to the slope of the country from south to north and the large number of streams that cross it from south to north, with their small tributaries from oilher side, the rain water is tapidly carried away across the district, or percolates into the beds of the streams, which are deeply filled with sand. To these conditions, coupled with the fact that at any time the rainfall is small, the district lying, like Shahahad, more or less between the area served by each of the monseons, and receiving the full benefit of neither, must be attributed the relative unproductioness of the soil, the large area anonthizated and the consequent thinger population in this district, as compared with others thinner population in this district, as compared with others in the division. The systems of pains or water channels and ahars, or artificial reservoirs, have been devised to ranke the most of, and to supplement, this scanty water-supply. Pains have been ent from all the larger stream; some large, with many distributaries; some small, with few or no distributaries. The largest pains that feed a number of distributaries and irrigate many thousands of neres are known as desicin pains, desicin meaning literally a pain known as design pains, dasian meaning iterally a pain that has ten branches. The main channels are known as pains, and the smaller channels taking off from them are called bhoklas, while the smallest channels that lead immediately into the fields are known as karha. The pains have been cut originally by the large land-cuners, without any headwork to check the flow of water. In some cases in consequence the pains with a rapid fall have deepened and widened their own beds till the main river had adopted them and changed ils general course, the old had being granthom and changed ils general course, the old bed being gra-daslly left on a higher level and becaming dry sooner, or even wholly forsaken except in the rains. This is a danger that should be provided against by legislation to enforce the provision of headworks. The entrance to a pain is always out some way up-stream, above the lands it is re-quired to irrigate, i.e., is taken off at a level higher than that of the lands to be served. During the rainy season, from July to Sentember, say, the wains are full and flow that of the lands to be served. During the rainy season, from July to September, say, the pains are full and flow well; but as the rains cease and the rivers dry up, the water from the bed'lins to be led into the pain by means of training works known as derhiain or haluain. In a year of seasty rainfall, ar when the full has been untimely, these pains are of event importance for the rice erap and the sowing of the rabi. Last year (1801) was such a year. There was hardly any minfall after August, and the Hathi Natshatra, the meet critical partial for the padly crop. Makshatra, the most critical period for the paddy crop, whoa the cars are forming, passed by without a drop of rain. A sudden activity was immediately seen in all the rivers, training works were vigorously pushed on at the heads of

the pains to try and lead into them every drop of water Mr. C. E. A. that was still left in their bods. The more wealthy land- W. Oldham. lords caused bunds to be erooted coress the river-bods at oustomary places, to block up what water there was, 24 Oct. 02. and thus to give it a head into some pain.

when the level of the country permits, the water is led into the field from the pains and bhoklas by menns of the little channels called karkas already mentioned; where the level of the water in the pain or bhokla is below that of the fields on either side, the water is raised by some of the artificial means in use in this part of the country. The three commonest methods in this district are the lathkunri (lever and buokst), chanr or sair (water basket) and karin (wooden cance-shaped lift). In the case of all the important pains that feed many villages, each village has its fixed turn of so many days or hours to use the water. This distribution of the right of irrigation from these channels by tures is known as parabandi. There is in this district a celebrated register of the distribution in the case of the principal pains, known as the fall Bahi, prepared by the former eveners of the Tikari-Raj, the largest private estate in Gyn. The enties in this book are still accepted as evidence of the rights of the villages specified therein. Frequently one village tries to take more water than it should; or size, when the rainfull is scarce, villages lower down the pains seek to get water before their turn, lost there he no water left whee it comes to their turn; and the disputes often terminate in blows and occasionally in bloodshed. Quarrels are also common in regard to the crection of bunds or garandis across the pains or bhoklas to steel or divert the water. Considering the vist system of these channels in the district and the fact that they are all under the private central of the zamindars and villagers, and considering the vital imperature of water in years of unfavourable rain, it is surprising how comparatively few cases cad seriously.

All the large and important pains in this district were constructed long ugo. I am not aware of any large pain having been newly constructed in recent times. The inception of such a work must come from a single opitalist landholder, who has the means to carry it out, and the incentive tode so, that is to say, whose personal interest it is; are else from two or more combined in interest, who are similarly circumstanced. And here we come to the difficulty that stands in the way of any such private onlerprise on a large scale at the present day. The gradual disintegration of property, the parcellement of rights which is encouraged by our own legislation, is the cause of this difficulty. Where formerly there was one land-holder supreme in authority over a critain large area, there are now perhaps fifty petty hard owners, whose interests conflict, or whose relations are so strained interest as to render combined action impossible.

The consequence of this change of things is unmifest in places from the neglect of existing pains. Only recently in a tract in which scarcity was apprehended the complete disropair of an important pain, that formerly served, it is said, some hundred manays, was brought to my notice. It is a pain which, if properly repaired, would save a large part of the tract in question from the possibility of famine; but when I endeavoured to persuale the local anniadars to take the work in hand, I famed that the proprietary rights in the land had been divided up to a remarkable extent since the pain was coostructed originally, and that the antagenlytic attitude of certain proprietars made it impossible for me to take any steps in the matter. The rapid sub-division of proprietary rights is patent to officers that have to administer the partition law. As this proceeds there is a teodency for these important works of irrigation to full into disrepair—works that are essential for the growth of the chief crops in this district, and without which a considerable perion of the endivated area would remain untilled. As it is, the greater part of the cultivating class, a large proportion of the tent population, have little to span after merting the necessities of life; and if these irrigation channels are not maintained, the present donsity of population exaant be kept up. It is probable, in my epiaion, that this question will at some future dute press upon the notice of Government and call for remedial measures. It will be well to consider it before such time. Unfortament could not undertake the cantrol and up-keep of the pains, or substitute a canal system without reouparting itself by levying a rate or cess; and a difficulty would lie in determining what propurtion of such cess or rate should be levied from the proprieters and what from the cultivature. If a system of canalisation from the smuller rivers is professionally declared to be impracticable, the pains will have to be maintained; and Government should, at all

Mr. C. E. A. events, so far exercise centrol that no pain should be with W. Oldham. out a musenry head-work to regulate the inflow, and prevent scenning out and rivers changing their courses and damage securing out and 24 Oct. 02, ing fortile fields.

- (3) The period for which the supply is ordioarily maintuined in sufficient quantity is—
  - (a) Four months, ie., from July to October.
  - (b) Three months, i.e., from July to Soptember.
  - (c) The period varies according to that during which the rivers are supplied. I have stready referred to the fitful flow of the rivers in this district. They may fill for a few days and be almost empty for the next fortnight, and then fill again with n day or two's rainfull, and so on. This is the reason why a system of canals of continuous flow is impracticable in this district; but it is no reason why a some measures should not be taken reason why some measures should not be taken by Government to make the most of the facilities that do exist, and at least control and regulate that construction and working of the pains, with-out nanccessarily interfering in the private rights involved.
- 13. (1) To a great extent. Bhadoi is the only crop in his district that can he depended on without some means for artificial irrightion.
- (2) To a very large extent, chiefly in rendering the cultivation of paddy and sugarcane possible, where it would otherwise not be.
  - (8) About-
    - (a) 10 per cent.
    - (b) 45 per cent.
    - (c) 70 per cent.
  - 14. About-
    - (1) 10 per cent.
    - (2) 30 per cent.
- (2) 30 per cent.

  15. No; not ordinarily, but frequently in the case of crops accessomed to well-irrigation. 12 or 13 per cent. of the total irrigation in this district is effected from wells. It has already been explained how water does not remain la the rivers for more than a few mentls, and the pains usually dry up before the end of the year. Irrigation thereafter must be entried on from ahars or wells. In ndry year the ahars also dry up by the end of the year, and from Junuary to June recourse must be had to wells, except when rain fells. The extent to which irrigation from pains is supplemented by irrigation from wells depends then chiefly upon the clurareter of the season. It may be stated as the general rule in an average year that in case of the crops requiring irrigation between January and June, wells must be reserted to. For instance, poppy and sugar-came cultivation and various kinds of market produce invariably require to be irrigated from wells in this district.

  16. (1) and (2) Fide answers to question 8 above, i.e., in
- 16. (1) and (2) Fide answers to question 6 above, i.e., in ease of continuous canals.
- It is difficult to form such an estimate: but the increase would, of course, he less than in the case of caush of coutinnous flow.
- 17. (1) No rate per acre is levied in the case of pain irrigation.
- (2) These pains are part and pacel originally of the bhadli system of tenare. Under this system the produce is divided between Inndlerd and tenant. The handlerd is supposed to maintain such works of Irrigation and to reap his recompense in the form of a larger an oant of produce as his share. I say the landlerd is supposed to maintain such works, because they do not always do so, or where they do, they do not always do it wholly at their own cost. They often make their tenants labour without charge, or else appropriate a larger share of the produce than they should according to the strict principles of the system. The ideal rule of the bhadli system is that the produce should be divided half-and-half between landlerd and tenants, and there are many officers who suppose that this is the general practice. As a matter of fact, however, division by half is very rare. The landloid generally takes nine-sixteenths of the produce and often ten-sixteenths. In explanation of of the produce and often ten-sixt enths. In explanation of this apparently unfair distribution, they plead that they maintain the unrigation works in good order and better than other landlords who take a smaller share of the than a laft share of the produce, e.g., when jungle or waste land has to be brought under enlitration, or in special cases when the cultivation requires unusual labour on the

part of the tenant; but these cases are infrequent, and the part of the tenant; but these cases are infrequent, and the ordinary practice, excepting only cultivation under special circumstances, undoubtedly is to take considerably more than half. It will readily he observed that this is nothing less than the exaction of an increased rate of reat on account of maintaining the works of Irrigation, which the advocates of this nationated system of tenure would assert to be the inherent duty of the landlerd, and the ready performance of which duty by the landlerd, and the ready performance of which duty by the landlerd, is regarded by superficial observers and by admirers of the blacki system as its greatest charm had us conclusive ovidence of the excellence of the system.

As the amount of extra demand levied in this way depends, firstly, upon the character of the zumindar, and, secondly, upon the price-current of the particular kind of produce at the time, it is not possible to state an approximate rate that would be generally applicable.

- (8) and (4) Nothing is paid in such forms to Governmoat by the owners.
- 18. Excluding the initial cost of digging the pains which, I take it, is not referred to here, there is the cost of np-keep and the cost of labour employed in leading the water into the fields from the channels. Uning to the generally sandy nature of the river-heds, the pains become silted up quickly and have to be cleared out every year or two. Considerable and have to be cleared out every year or two. Considerable oxpenss is incurred in this process—expense which primarily fails upon the landlords, but all ordinary electance of channels is done by the cultirators themselves by what is known

The cost incurred by the tenants in leading the water to the fields is small, this work being usually done by the cultivators themselves.

19. I have observed no damage o used by Irrigation itrelf in this district. But damage has been ludirectly caused
his some places by rivers changing their courses owing to
the execution of pains. In this way I have seen the lands
of soveral villages covered with sand and rendered uncultivable. There can be no doubt, too, that the net-work
of pains in the district must carry quantities of sand alout,
and eventually increase the proportion of sand in the soil.

There is no water-logging in this district, as the slope from south to not his rapid. A consequence of this slope is that there is no need of raising high banks to the pains, the level of the water being generally below the ground level on each bank. The pains, 100, are nearly always out along the natural lines of drainage.

the natural lines of drainage.

20. These pains are constructed and maintoined by the landlerds with the reservation I have already noted in paragraph 18 above. Ordinary pelty maintenance, such as clearance of silt, repains of small breaches, etc., is done under the goam assem. At the order of the landlerd or his local agent or servant, the cultivators have to supply one man per plough to turn out on these occasions to earry out such work. They generally turn out in a body at such times, and this is known as goam.

The,npproximate annual cost per nere cannot he ascertained with any approach to acouracy.

The system of pains, as it exists in this district, is indispensable for great part of the cultivation, and it works fairly well. As I have already stated, the bhaoli system of tenure is intimately connected with this system of irrigation. Both are the result of the physical conditions of the district, and they are largely inter-dependent. If the bhaoli system were abolished, these pains would fall into disrepair. The cultivators could not, or would not, combine of their own accord to keep them up. The greatest drawback to these systems is that the control of the irrigation works gives themendous power to the landlords over their tenants. They place the tenanty in more or less complete subjection to the themendous power to the landlords over their transts. They place the tenantry in more or his complete subjection to the landlord, who can, and very often does, extort most unfair terms from his tenants. This system of irrigation festers, as it were, the bhaoti system of tenare, which is an anachronism, and is the canee in great measure of the serf-like status of so many of the tenantry in this district. In my opinion legislation is required and will eventually have to be faced. The following are the two most important directions in which action is at present regoired:—

(1) The provision of a masonry head-work in every pain to control the level at the entrance and regulate the inflow. I have already referred to the damage that has been laused by pains seeming out at the head, depening and widening its channel, and thus leading ultimately to a change in the course of a river. Busides this danger, there is the injustice often caused by

one pain taking off higher up a river, appropriating all the water in the river. It has been a long existing practice, two, in places to construct bunds right across the river to drive the water into a pain, and thus deprive lands further down stream of all supply.

(2) The enforcement of the up-keep of existing pains in bhaoli tracts. The liability of pains to be come neglected owing to the sub-division of proprietary rights has already been noticed. In this way a very heavy and unjust loss is caused to the cultivators by the neglect of quarrelling shareholders; and measures are necessary to protect the cultivators in such cases. Power should be given to the local officer to intervene in case of neglect and lovy the cost from the proprietors.

It will be a question, it my opinion, at some fature time, whother Government should not assume the entire management of the pains or undertake a system of canalisation on their lines, in which case division of produce by half and half exactly between landlerd and tenant woold have to be enforced, or elso cash runts introduced, and the water-rate would be levied equally from landlerd and tenant. This, however, is not urgontly required; but the two measures stated above are very necessary.

- 21. (a) Paine are essentially private canals. The persons entitled to use the water of pains have paras, or turns, assigned by mutual agreement or ancient coastom, and disputes both in the Criminal and Civil Courts constantly occur in this connection.
  - (b) Government has not done so hitherto.
- 22. Yes, if legislation were effected on the lices indicated in my answers to question 20 above, I think it would be most desirable to encourage and assist in the construction of pains by private persons. This might be done by granting liberal advances for specific and professionally approved works of this nature.

# D.-TANKS.

23 (1) and (2). Tanks are seldem used for irrigation in this district, but ahars will come under this category. An char is an artificial catchment basin formed by blocking a small drainage rivulet, and thus backing up the water. These calchment basins are nearly always of a more or less rectangular shape, embaukmeats being raised on three sides of the rectangle, the fourth side being left open for the drainage water to enter. Owing to the slope of the land, the highest embankment is usually on the north, and this embaukment generally runs east and west. From each end of this embankment, other embankments project southwards, diminishing in height as they proceed according as the level of the ground rises. In this way a three-sided catchment basin is formed, deepest at the northern side where there is always some arrangement, at the spot where there is always some arrangement, at the spot where the drainage of the catchment area would naturally issue if there were no embankments, to let out the water from the ahar for purposes of freigation; and if the ahar is built on a drainage vivulet, and thus receives the drainage of larger area than its own, there is a spill or weir to pass off surpins water, which may perhaps flow on to matcher akar further morth. These outlets and spills, or wers, are formed in various shapes and known by various names. In small ahars, where the quantity of weter banked up is not great, it is generally sufficient to cut a narrow passage through the earthen bank at the deepest spot to draw off the water as required. If the mass of water be greater, a half pipe formed cut of the trunk of n palm tree and known as adhangs is let into the bank to protect it from excessive crosion. If the ahar is n very big one, a masenry outlet is often built into the bank to protect it from excessive crosion. If the ahar is n very big one, a masenry outlet is often built into the bank to protect it from excessive or chanka or chanka. The weirs or spills to pass off surplus water are made of brick or stone mas

level through which it flows to the field where it is required. Mr. C. E. A. If the water in the ahar be low and does not reach the W. Oldham. bank, a depression (kandari) is dug by the side of the bank, and a small channel cut from the deep part of the 24 Oct. 02.

ahar, leading into this depression. Sometimes when the level of the water is very low, it is necessary to employ a sories of two or even three lifts to raise the water to the level required. The prime value of these catchment reservoirs is that they store up water that would otherwise be carried away by the naturally rapid drainage of the country. The rainfall in this district is so small, and so uncertain as well, that the cultivators cannot depend upon it. It is quite insufficient, in fact, to maintain cultivation all the year round. If it were not for those ahars, there would be no water on the higher lands (where pains are not practicable) available for purposes of irrigation after the month of September. They are ladispensable on the higher tracts that lie between the river-basha, firstly, for irrigating the paddy as it grows up, and, secondly, for the sawlag and germination of all the rabi crops. I give this description of ahar irrigation at some length, as it is specially provalent in this district; at the present time almost half the irrigation carried on in this district is offected by the ahar system; ond as I find it has previously been inaccurately described, or confounded with the system of genrabands, which is a different thing, or else connected with pain irrigation from which it is quite di-tinet. A pain may eventually, after it has almost spent itself, lead into an ahar, but such cases are rare, and pain irrigation is not possible on the highest lands for which the ahar system has specially been devised.

Irrigation from tanks, which are comparatively few, is carried out in much the same manner.

- (3) (a) Four to six months, July to December.
  - (b) Four mouths, July to October.
  - (c) Dependent on rainfall.
- (4) Depends on the size of the ahar or tank. The largest in this district must irrigate about 1,000 acres.
- 24. (1) to (3) To n much less degree than in the case of canals of continuous or intermittent flow.
  - 25. About-
    - (1) 10 per cont.
    - (2) 30 per cent.
  - 26. Fide answer to question 15 above.
- 27. See answer to questions 3 and 16 abovo. The increase is less in the case of ahars and tanks, and specially in the case of tanks, where the difficulty of lifting out the water is considerable.
  - 28. (1) to (3) Nil.
- 20. This is done by the tenant himself. The actual cost cannot be stated. He has no scenarity for recoupment.
- 30. Vide answers to question 20 nbove. In the case of ahars small repairs are done by the tenants, large repairs by the hadded. I would say 4 names to 8 annas per aere irrigated should be spent annually to keep an ahar in good repair. The amount, however, depends largely on local conditions, nature of soil, etc.

Tanks are falling into descetude in this district and are not maintained in repair.

- 31. I know of no such case.
- 32. Yes, by advances to laudlords for specific approved works.
- 33. Inconvenience is felt. See answer 80 above. Tanks are not kept in repair at all, I regret to say, in this district. They have been largely superseded, however, by the abars which are found to be much more convenient for purposes of irrigation. Abars are usually constructed on high lands where the clay is comparatively hard and little silt accumulates. Abars are generally kept in good repair. This is done by digging a layer of soil from the interior of the abar, and heaping the soil on the banks where required.

# E-Wells.

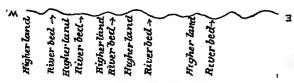

31. As far as wells are concerned, the surface configuration of the district need only be considered. There is the hilly country all along the southern side of the district, and Mr. C. E. A. the easy slopes and plaine of the rest. A section from W. Oldham. north to south would be semething like this:—

24 Oct. 02.

SP. No, not in this district, where irrigation by welle on any extensive ocalo is not practicable. The efforts of Government would be better devoted otherwise.

Again, the district is crossed from south to north by numerous rivers, the beds of which and adjacent lends are low, the land between each river basin is relead. Thus a section from east to west would be something like this:— 40: Temporary wells ore commonly used in this district in tracts where the soil is sandy, or a long water-conrec. They afford considerable protection to the poppy which is largely grown in this district, and in a less degree to other dry crops.

(1) The average depth of a permonent woll in the lewer tracts or near the rivers is from 15 to 25 feet, but on the higher tracts it vories from 85 to 40 feet.

(2) (a) and (b) The snpply is chiefly from percolation, but occasionelly from springs. A well with a good spring will never fail, but a well served by percolation only is liable to fail in dry years and in ordinary years in the hottest months, if not cleared ont.

. (3) The cost varies with the dopth and diameter of a well. The overage cost of a good mesonry well of, say, 42 feet diameter will be perhaps Rs. 300.

(4) A good masonry well would last 200 years, but it built of bricks set in mud, it will not last more than 25 years.

(5) With the lath-kunri (lever and bucket). The mot is raroly used here.

- (6) About 5 ocree.
- (7) About 5 cores.

35. (1) Vide answere to questions 7 (1) to 7 (3) (c), 13 and 24.

(2) Land irrigated by wells is usually deficila in this district. Well-irrigation is almost wholly confined to the immediate vicinity of the villages, where poppy, merket, garden produce, marua, barloy and ench like crops are grown, and where the produce is much better and more valuable then in the lands further from the village irrigated by pains and ahars. Well-irrigation is hardly ever resorted to in the case of the kharif, or the larger portion of the rabi crop. Perhaps 9 per cent. of the wells in the district are on the dihans lends, or lands immediately adjoining the village.

36. The lands commanded by wells in this district ero the higher lands around the villogs. This method of irrigation has always been adopted on such lands, end no comparison with other conditions is practicable.

- (1) 50 per cent.
- (2) 500 per cent.
- 37. (1) and (2) No such rate is paid.
- 37. (II) Vide supra.

38. (1) Frequently in this district rock is met when sxcavating o well. The custom is to dig tentotively before embsrking on a masonry project.

(2) Not very often, but in several parts of the district in mell areas the cley is unsuitable for well-digging, es it folls in at coce. Such clay is locally known as kachua mitti, from kachua, a turtle, either because these animole are enposed to hurrow in the earth, and thus cause the sides of the well to fall in, or because the clay resembles the puddle-like clay ejected by the turtles when they burrow.

38. (II) The result of an experiment once made in boring is given in Appendix C attached. No assistance has been offered to, or sought for, by any private individual to my knowledge. I think the people know best what suite them.

40. (II) I would only take measures in this direction in a year of drought, and would give advances widely for their construction. Their cost is bat Rs. 4 or Rs. 5 on the average.

## Appen dices.

C.

Extract, paragraph 92, of the Land Revenue Administration Report, Bengal, for the year 1892-1893.

92. Tube-wells.—The Collector of Gya reports that a tube-well was sunk in the Gorments, implements, machiners, steps, steps.

a depth of 44 feet in a sub-coll of stiff yellow clay. The experiment seemed to show that in a stiff clay soil a tube-well is useless, and that a 25 feet

limit under a simple draw-pump is also usedess for the Gya District, since in the hot weather numbers of these wells ore dry to a depth of 40 feet. The experiment was made in March in a locality where the weter was at the time aheat 15 feet below the surface. In the hot seeson the water here falls to 30 feet. The Collector proposes to here through a further depth of 30 feet (apparently to a depth of 60 feet altogether) in the hope of tapping a spring. He reports two notoworthy snecesses in the use of tube-wells in the Gya District. One of them relates to the well supplying the locomotives in the railway stetion. The depth of that well is considerable, but the Collector does not know the exact dimensions. The well ran dry in

the hot weather. A 6-lock pipe was driven through the Mr. C. E. A. bettom to a depth of 20 feet helow. Water was obtained W. Oldkamand has never failed since. The cost was trifling. The other relates to the Jubilee well in Tikari; it was sonk to a depth of 40 feet, when all hope of success seemed to be at a sonk of a seement of the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the cost was seemed to be at the c way. A smoller well was thou driven down in the centre to a further donth of 20 feet. The weter rose 40 feet in a night, and has stood at that height (roughly 20 feet from the serioce lover since. The results are important as showing the possibility of obtaining water for irrigating sugareane in the Gya District in May in the hottest seeson when the ordinary wells ran dry.

II.

#### Memorandum.

No. 1538-G., dated Gyn, the 23rd October 1902.

From-C. E. A. W. OLDHAN, Esq., C. S., Collector of Gya,

-The Commissioner, Patna Division, Bankipur.

In roply to your letter No. 5174-G., dated 26th nltimo. in roply to your letter No. 01/4-Cs, taken 20th altimo, io regard to the question of the expediency of legislating with a view to give Government control over the fighting for water which now takes place and whether any of the major private irrigation works should now he taken ever by Government, I have the header to subject the annoved copy of the opinion given by the Executive Engineer, Eastern Sone Division. It will be seen that Mr. Brenner does not consider that Government should setually control the distribution of water from ahars and pains, but he is of opinion that it might be possible to establish a record-of-rights for each river, pain and ahar; and laudlords should be compelled by law to keep all their weirs, pains and ahars in good order, to provide head sluices to pains, and massory escapes and outlets to all large ahars.

- 2. I am strongly of opinion that some legislation will have to be taken, as I have already stated in my answers to the first series of questions issued by the Irrigation Commission (vide answer to question 20). I have forther considered the sobject since and have consolted many landships and others and consider that the District Officer considered the sobject since and have consolted many land-holders and others and consider that the District Officer should be empowered by law to enforce the maintenance in good repair of all pains and ahars used for irrigation, and in case of default to be empowered to have the necessary repair carried out under his own orders, and to lovy the cost there-of from the landlord or landlords concerned in proportion to the extent of their interests. I am not of opinion that such control as I would propose would prevent fighting over water. Soch disputes take place even in causal irrigated areas, though to a smell extent no doubt.
- 3. In order to keep up the irrigation works and with a 3. In order to keep up the irrigation works and with a view to the distribution of water according to the recognized turns or rights, a man might be retained in cash village, to be paid by a cosa from the villagers themselves, whose special doty it would be to look after these works and give each cultivator his water in due turn. The District Officer should be empowered to appoint such a village servant in any case in which he found sufficient reason, in consequence either of the occorrence of frequent disputes, or the large extent of irrigation, or for other reason. In case this man's remuneration whether in cash or kind were not paid by the village, the District Officer should have power to enforce its payment. At first such appointments might be made only payment. At first such appointments might be made only in the case of the more important pains and akars in which many proprietors have separate interests, and the result of the experiment awaited. It is no use, however, hoping that

by the assamption of Government control, fighting about water will be prevented. Such disputes will always occur in years of drought.

- 4. I have suggested above that servants of the villages should be appointed, as this system is calculated to work much more smoothly than the appointment of direct servants of Government, who would be a source of much greater harassment and expense to the people.
- 5. I here already stated in my answers to the questions put by the Irrigation Commission that proprietors should be compelled by law to make masory head works for every pain. I am also of opicion that they should be compelled to moke masorry outlets in all chars where the District Officer may consider it necessary.

Dated Baroon, the 19th October 1902.

From-The Executive Engineer, Eastern Sone Divi-3100,

To-The Magistrate and Collector, Gya.

With rescroves to your andorsement No. 1424-G. of 27th ultima on letter No. 5174-G, dated 26th idem, from the Officiating Commissioner, Pratna Division, I have the honour to report that I do not consider that it would be advisable for Government to interfere with the octual distribution of water from ahars and pains. The supply of water is not sufficient for all in years of scanty rainfall and if the distribution was taken a way by Government and in the distribution was taken and pains. bution were taken over by Government, cultivators would quickly forgot their previous troubles and attribute all the damage done by want of water to mi-management. A large establishment of subordinates with attendant ovils would be wanted to sopervise the distribution, and I am certain that the cultivator would not really be much better off than at present as the cost would be heavy.

It might be possible to establish a record-of-rights for each Nuddi, pain or akar. If this could be done, I think there would be less fighting over water, as the parties would at least know for certoin which side was in the right.

2. With regard to the proposal that some of the major works should be taken over by Government, I am also of epinion that this would not be advisable. I think that the laudlords should be compelled by law to keep all their weirs, pains and ahars in good order, to provide head sleices to pains, and masoury escapes and outlets to all large ahars.

Boyond this I would not recommend Government inter-ference in the management. The cost to the coltivator would, in my opinion, more than counterbalance the advant-age he would denve.

- 1. Q. (The President.)—How long have you been Collector of Gya?—For nearly five years.
- .2. Q. Before that were you in this part of the world ?— Yes, I have served in Shahabad, in Darbhanga and In Monghyr olso.
- 3. Q. And you have probably had some experience of famine?—Very slight. In 1892 in the Monghyr District I was in charge of a small famine relief circle. The distross was not sovere.
- 1. Q. Would you say that there was any place in your district where there is a reasonable fear of famine, or are you practicelly immune?—I don't think we are immune, but we are almost immune at present. There are one or two tracts in the district in which I think famine might coent.
- 5. Q. And what is the characteristic of these districts ? 6. Q. And what is the characteristic or these districts? Is it an absence of pains or ahars, or is there may deficiency of rainfall?—The normal rainfall is low in cordistrict as it is in the Shahabad District. Secondly, the means of irrigation is these truets are few and unreliable; the lands are high; the soil is not very productive; and if a good rainfall does not occur, the reservoirs and artificial channels for irrigation are not filled, and consequently the cross suffer. crops suffer.
- 6. Q. What would be the remedy for this ?—The only remedy is the extension of the system of artificial irrigation by channels, reservoirs and wells.
- 7. Q. The extension of channels and reservoirs has pro-bably its limits; has it not ! Has all been done that can be done?—I think not in the case of channels, and in the case

Mr. C.E. A. of reservoirs also, I think, there is room for extension and W. Oldham. improvement.

8. Q. These channols; ore they derived from the etreams
21 Oct. 02. coming from the Gya hills?—From the hills of ChotaNagpar which fringe the Gya District.

- 9. Q. And which are torrential?—Quite so, with the exception of two or three etreams which are more or less percunial. The Punpau generally has water all the year round, though it has very little in the hot weather; nod there are two other small streams which retoin their water.
- 10. Q. The Poon Poon passes through Patna also?—It does. It is a small river, but still it retains water, owing to the soil through which it flows.
- 11. Q These ahars and channels are very ancient, I suppose?—They are, no doubt.
- 12. Q. They are entirely of native making. They have not heen suggested by us?—Not at all. By far the greater part of thom data from before the British rale. The tendensy aow is for these channels to foll into disrepair owing to the disintegration of proprietary rights. Formerly when these channels were made they were made by the order of large esminders who owned large cototes and hod large powers—powers which no examinder at the pre-ent day wields or can possibly wield under our laws. For instance, the Mnharaja of Tikari was all powerful in the district one hundred and fifty yeers ago, and in the time of previous Mabarajos, who had similar authority, the greater portios of these channels were made, though we have no historical records of this. Now it is impossible for such new channels of the description to be made by any zamindar, hecause hs will have to carry them through the lands of other zamindore who will not agree, or who will obstract in some way or another.
- 13. Q. Then that state of things is at least partly due to this outfortmate want of cohesion among them in recognising common objects?—It is the state of society at present. It is a lamentable condition of things as doubt, batit is n fact that no two neighbouring ramindars will combine together to help in a work of common benefit.
- 14. Q. And that the zamindars is this great sub-division of land are not as large zamindars as there were formerly?—Not rearly. This disintegration is going on daily. It is admitted by all.
- 16. Q. What is the remedy ?—Disjutegration we cannot prevent. The only device for getting round the difficulty is legislation.
- 16. Q. Legislation is the direction of msking the authority of the Collector mere capreme?—Of enforcing the up-keep of these chonnels on which the caltivation of the soil or of % the of the soil of the district depends, mantaising them, repairing them and extending them have the necessary. Without legislotion this cannot be done. It is improceitable at present. I know many cases of pains which bave fallon into disrepair owing to these casees and which have either become unused or partly unused, or so largely cilted up that they are rendered less corviceable than they used to be.
- 17. Q. And would you give the Oellector summary powers to levy n fine in order to get the work done or force the men to eerry it out?—I would give the Collector seek power as this that he should be in a position to say to cortain zamindars who own the lands through which these channels pass, "repair them," and if they did not carry out his iostructions, he should be empowered by law to bove the work carried out himself and to realise the cost from these zamindors in proportion to their interests.
- 18 Q. Do you think the effect of such a law being passed would be to put them on their mettle. If not, it would give the Collector a great deal to do F—I think it would have that effect also.
- 19. Q. Do these works reolly require some professional advice to menage them ?—They do is their inception. That is another point ou which legislation is required. No new pain should be constructed nuless it be approved by come professional mao.
- 20. Q. I gother it would not he very easy to construct a new pain without interfering with the rights of some other zamindars?—It would be difficult. Objection would no doubt be raised by the zamindars having riparian interests further down. They would perhaps go into the Civil Court for an injunction or for damages.
- 21. Q. (Sir Thomas Higham)—Can they get an injanetion to prevent them?—I think so. Certaioly. The Civil Court has full powers to interfere in such matters.

- 22. Q. They can prevent a pain being constructed?—They can issue an injunction.
- 23. Q. Then the coss goes up to the High Coart?-
- 24. Q. These pains are little channels leading ont of nullahs, I suppose ?— Leading from the rivers.
  - 25. Big and little ?-Yes.
- 26. Q. Does the ramindar put a bund partially asross the nullah?—It is not necessary at all. (The witness illustrated his meaning to the Commission.)
- 27. Q. Is the zamindar allowed to pat a bund across a pain, or partiolly across it P—Iu many sases they have acquired what is called a prescriptive right to do so; but if any zamindar were now to bund up a pain, where it has not heen the custom to make a bund hitherto, the other proprietors would at once go into Court and get it hroken down.
- 28. Q. (Mr. Mair-Mackenzie.)—And do they, as n matter of fact, over attempt to do that?—Very rarely. Occasionally they do. Only the wealthy zamiudars are able to rick it.
- 29. Q. (The President)—Theu I suppose the ahar does double duty in irrigating the hade and having its own bed irrigated? Is that so?—It is, Sir. An ahar fills in July, and August and part of September. It is then easy to irrigate paddy and othe crops, and as soon as the water is all used up, rabi crops are grown in the bed of the ahar.
- 30. Q. And to which is the greatest importance attached—to the raddy or the crops grown in the hed?—Poddy as far as my experience goes. No doubt a very excellent rabi crop is produced in the soil of the hed, but it is a very small one.
- 31. Q. Are wells kept ap in the neighbourhood of these chars?—I bave not noticed that in the Gya District.
- 32. Q. (Mr. Muir-Mackenzie.)—You don't find that people choose sites for their wells be preference in their neighbourhood P—No. Abore are generally made at a distance from the villages.
- 3S. Q. And the wells are generally close to the village?
  —In my district, Gyn, wells are only generally used in proximity to the villages—in what is known as the dihans.
  Well irrigation catalde village lends is very rare.
- 34. Q. (The President.)—Do you know whother nny applications are made for advances to have ahars, pains or wells?—Ostensibly for this purpose there are numerous applications, but the greater part of the monoy is spent otherwise in sach cases.
- 35. Q. Is there may system of takavi advances for wells?—There is no special system for wells.
- 36. Q. In your district does irrigation by wells occupy an important place?—No. Pains and ahars are far and away ahead. I calcalated that about half the cultivated area in the district is irrigated from ahars and tanks. Tanks are very few in the Gya District, but nearly half, if not quite half, of the whols cultivated area of the district is irrigated from these ahars and tanks.
- 37. Q. And then how much irrigation is there from the pains?—I cannot exactly say.
- 38. Q. Aboat a quarter?—Qaito, perbaps n third. I would not be snre; I have not calculated this.
- S9. Q. Would there not be a feeling of confidence if you had a well for the ahar that in years of drought it would stand out better?—A well irrigates such a small area.
- 40. Q. Do you know how much it is in this part of the world?—A well will not irrigate more than 25 bighas hers. The average arso irrigated by wells is about 5 acres.
  - 41. Q. Is that all the year round ?-Yes.
- 42. Q. (Mr. Muir-Mackenzic.)—Does that mean n well of a single mot or more?—A well of one mot will irrigate about 5 acres.
- 43. Q. (The President.)—Do you think ony assistance is to be rendered to irrigation by a more liberal eystem of takavi advances?—I don't think it is a satisfactory system. I don't think it would be eatisfactory.
- 44. Q. And why, please?—Because these advances are, as a general role, not speat on those works for which they are osteosibly taken.
- 45. C. And can they not be looked after?—It is very difficult to ensore control, especially where you have got a large number of advances. It is impracticable in foct.
- 46. Q. Woold it be worth while to have a special officer or some one order the Collector for this parpose?—I don't think so. I would not advise it. I would depre-

sate any further special establishments. They are only u source of hurasyment.

- 47. Q. Do you think it would be a good thing te have a special officer going round the district giving taken advances?—I think that would be useful. Even in my district, I think, it would be useful to have a special officer going round and giving advances.
- 48. Q. (Sir Thomas Higham.)—What would it be spent upon f.—On the making of wells, repairs of ahars, cleaning out of channels, pains, etc.
- 49. Q. (Mr. Muir-Markonzic.)—I don't quite understand why you push the advances so much in Gya if you deprecate the extension of the system?—I den't deprecate the appointment of a special establishment.
  - 50. Q. (The President.) I see you say in your note that "a system should be introduced by which sanction to the grant of advances could be more promptly given and the cash paid personally by a greetted officer at convenient centres." You see no other practicable way of doing it or any botter way than this P—I think it is one of the means to the cold that we want to attain.
  - 51. Q. (Sir Thomas Higham) You speak of one canal that you have in continuous flow; that you call the Patna-Gya Canal?—Yee. That is one of the branches of the Sone system. It irrigates a comparatively small area in the Gya District.
  - 52. Q. and on the Sove Canal do they take the rents in slave of produce (bhaoli)?—In some parts, but the rents are generally cash in canal-irrigated areas.
  - 58. Q. Do you think, as regards the water-rates on the Sone Canal, more might be taken from the occupants ?—I think that the compensation from the canal Irrigation in the way of additional produce is more than what they pay for the water. More could be taken perhaps from them.
  - 54. Q. In the case of the non-occupancy tenants there is no limit to the power of the landlard to raise the rent. Is there?—There is a limit. He would have to go to Court, I think.
  - 55. Q. Can landlords enhance the cash rents on their non-secupancy tenants?—There are previolous of the law by which they can.
  - 56. Q. Have they risen in consequence of the mater advantages P-Yes, very largely.
  - 67. Q. Would not that point in the fact that occupiers' rates are not as high as they might be?—I will not say that they are increasing now on those lands which have reached their full degree of productiveness.
  - 68 Q. There is more competition in the way of applications for water now than there was formerly ?- Certainly.
  - 59. Q. So that if the rate was raised people would still come forward and want the water f-1 think they would.
  - 60. Q. You have very strong views as to the rates being too low f-I will not say they are too low.
  - 61. Q. You say that the cultivation in the district depends on the traks and abars?—Half the artificially irrigated cultivation.
    - 62. Q. That includes the point too?-No.
  - 63. Q. What proportion is dependent on the pains?— Mr. Mulr-Mackenzic also asked me that quostion. I am not in a position to say exactly, but I should say one-third roughly.
  - 64. Q. One-third of the artificial irrigation P-Yes. 56,000 acres use, I think, irrigated by the canals.
  - ob. Q. You say that one reason for proventing the construction of new pains is that the heldings have become very much smaller, and that the land-owners have much less power. Supposing that could be get over, would there not be an objection on the part of all the owners of existing pains to any new ones being constructed. Would it be possible to construct any more without interfering with casisting rights and pulvileges?—Yes, it would. There are some atreams from which no pains have been taken off at all as yot.
  - 66. Q. There are rome P.—Yes. There are some places, moreover, high up the streams where a pain might be taken off and no objection would be calsed.
  - 67. Q. Then there is room for the extension of paint if you get eyer this difficulty? There is room for still more important improvement in the way of repairs to, and maintenance of, existing pains.

- 68. Q. Because the present owners will not combine ?— Mr. C. E. A. Yes. W. Oldham.
- 69. Q. Does one pain irrigate many independent holdings?—A pain may irrigate a hundred or two hundred villages or mere; that is to say, a large pain would.
- 70. Q. And there is no way of sufereing the elegrances among a cha number. In there no power for management —no panchayat P—Nouc.
- The paneagy tr-Nous.

  71. Q. Then who is supposed to take the initiative?—
  The zamundars. It is their business. The system in Gya
  is the bhavisystem of rents which theoretically catalis
  upon the zamindar the duty of maintaining these works of
  irrigation. That has been the custom from time immemoriol. There is no law on the subject; some legal provision
  is required. The Collector cannot interfere at present,
  but he ought to be able to.
- 72. Q. When yoo have a number of zamindars, it simply depends upon their powers of co-operation?—Yes.
- 73 Q. Can any external influence be brought to bear upon them ? No legal influence.
- 74 Q. Only personal?-The days for that ure in fact departing too.
- 75. Q. For that you say you would require legislation; would you not?—Certainly. It cannot be done without legislation.
- 76. Q. To whom would you entrust the duty of sufercing their up-keep?—To the Collector.
  - 77. Q. Not the District Board ?- No.
- 78. Q. (Mr. Muir-Mackenzie.)- Why do you object to the District Board !- Because it is a Board.'
- 79. Q (Sir Thomas Higham.)—Do these ahars have an excess of water coming into them?—Occasionally.
- SO. Q Is that not a common trouble? Fairly common, but they ought to have, and nearly always have, an escape.
- SI. Q. Do that have an escape blg enough?—If it is not blg enough, of course the ahar may burst.
- 82. Q. Are they ever filled from the pains?-Yes, sometimes.
- 83. Q You may fill one and then the rains come down and it creffora? Yes, that is possible
- 81. Q. I suppose they belong to the same owners as the paine?—Sometimes
- 63. Q. Thoso is no question of paying for having them filled up f-No. Ahars, you will understand, are pre-eminently suited for the higher lands where rains cannot go. Pains, as you understand, can only follow the ralleys of the streams, but ahars are intended for the high lands—what are known as land lands in the Gya District where gains cannot reach.
- SO. Q. Is there room for making more of these ahara? -Yes.
- 87. Q. What do they want, money advances, or some-body to give them a lead ?—Money, enterprise, education.
- 83. Q. Do they make many new ones new ?- Newshars are occasionally made.
- 89. Q. You could not give any idea as to the numbers -No.
- 90. Q. I suppose you have never had famine in the Gya District, have you P—Wo are supposed to have had it in 1873-1874.
- 91. Q. Have you got any programme for works there? -Yes.
  - 92. Q. What wort of works -Roads, tanks.
- 93. Q. Irrigation tanks f .-- Tanks which would be need both for drinking and irrigation.
- 94 Q. Would it be possible to employ famine labour in clearing these pains out and parting them all to rights, or would that be objectionable, as being private property !—It might lead to disputes.
- 05. Q. Would the owners be able to employ labour in that way P—No doubt they would, but we would be doing work for private persons, not for the public.
- 16. Q. That is better than doing work which is useless?
  —We do not do work that is useless. Thaks are not useless, nor are rouds necless.
- 97. Q. You have plenty of useful works to employ your labour?—Certainly.
- PS. Q. You employ labour that you have on roads?— Yes, and tanks of which we are not likely to have a large number.

Mr. C. E. A. 99. Q. You propose to pot in masonry beads to these W. Oldham. pains?—I think that is a very organt necessity.

- 24 Oct. 02.

  100. Q. Would there he any great objection on the part of the owners to that P—There would be some objection na doubt, bat it should be overruled. Great distress is being caosed by the non-existence of soch bead-works.
  - 101. Q. Would they welcome heads like that to prevent damage, or would they regard it as a means of reducing supply P—The latter. They would not welcome it.
  - 102. Q. Woold you propose to make them even if the objection exists?—I would give them the option of doing it, and if they did not, I woold have it carried out and recover the cost from them.
    - 103. Q. You would do it at their expense?-Yes.
  - 101. Q. (Mr. Muir-Mackenzie.)—With reference to land improvement loans during the last five years, I notice that the largest number was made in 1896-97—107. Can yen toll me the amonat?—No, but Rs. 1,04,000 was epent on irrigation works olene—wells, tanks, irrigation chennels and reservoirs.
    - 105. Q. Aboat a thousand rupees a loon?
    - 106. Q. (Mr. Allen).-Rs. 1,04,550 was spent.
  - 107. Q. Were the loans as large as that?—That was exceptionelly heavy.
  - 108. Q. Tako 1898-99?--There were 18 loans and Rs. 15,135 spect.
  - 109. Q. That again is nearly a theusand rupees a load To whom are they generally advanced?—There are two kinds of advances. Those figures represent only the Land Improvement Leaus Act. Advances are mode both to zamiodars and rayats, for imprevements to zamioders, under the Agriculturists' Loans Act to cultivotors; very rarely to coltivators under the Land Improvement Loans Act.
    - 110. Q. Is tenure any obstacle !-- No.
  - 111. Q. Theo why do you edvance so rarely ?- They take their leads under different Acts.
  - 112 Q. But if a roynt wants to make a woll, cannot be take it under the Laad Improvement Loans Act?—He can if he likes.
  - 113. Q. That bardly seems in accordance with the intentions?—No doubt, cattle, seed and other things are the objects. I do not recall any case of a reyat applying for a loan for a well.
  - 114. Q. Is that become he does not want it or because of the difficolties of getting it ?—I connot say.
  - 115. Q. Are there any difficulties on account of his tenure?—No, so long as the security is sufficient. If he has a large oultivation, he can get a correspondingly large loan.
  - 116. Q. And occopancy rights?—We do not make any bord and fest rule. Occasionly loans are given evoc to those with non-occupancy rights.
  - 117. Q. Is there any difficulty as to the availability of the security that the rayat one afford f—No. It means delay, but there is no great difficulty. There is delay on account of the inquiries to be made by the subordinates of the Revenue Department.
  - 118. Q Can that be obviated by any change of system?
    —If an officer were deputed to go into the district where it was thought advances might be required with fall powers from head-quarters to give leans up to a certain limit.
  - 119. Q. Havo no officers soch powero at present?—Officers in charge of Sab-divisions have these powers.
  - 120. Q. Do not they exercise them P—No, not in my experience. Applications for lance come into the head-quarters of the district ar sub-division.
  - 121. Q. And hond-quarters are often far distant from the applicant's chode?—It is not altogether the distance. The serious difficulty is the obstacles created among the maharrirs, and until the applicant gives 10 per ceet, to the men who deal with the loan, that loan is not given; some difficulty is raised.
  - 122. Q. Is no alteration needed in the period of re-payment of the load or lowering of the rote of interest?—I da not think it is necessary to lower the rate of interest; it is olresdy low.
  - 123 Q. What period of repayment is osually fixed?—Agricolturists' leans are usually repayable in three years.
  - 124. Q. And Improvements Loans?—It depends on the amount. Ten to fifteen years, very seldom fifteen years. The law allows op to twenty.

- 125. Q. I think the law allows repayment up to thirty years. The rules say tweety years, hot they often restrict the law oo this point. Woold you be prepared to go up to twenty years?—No, not beyond ten years.
- 126. Q. Why do you prefer the short period?—I think the men ore fully oble to pay within that period.
- 127. Q. If you allowed a langer period, woold you be oble to give leans to semewhat poorer cless of men?—We might, hot I do not think it is a matter of much import-
- 128. Q. Did yoo in the year of scarcity advance may considerable aum for the construction of kachcha wells?—No, it was not necessary. Last year was the only year of opprehended scarcity during my tenore of office.
- 129. Q. Have you over been canfronted with the difficulty that a scarrity that is offered is subject to a prior enoumbrance ?—Occasionally, not frequently.
- 130. Q. A witness soid that he considered that londlords might with advantage be given mere facilities to secure an enhancement of their rent, justifiable in consequence of improvements effected by them. Do you think that advisable?—I do not think any further facilities than are already provided by the Act need be given.
- 131. Q. He has to go to Court?—There are two ways—by coetract and by suit.
- 132. Q. If the matter is sobstantially beceficial to the teenet, he would have no difficulty in getting enhancement by contract?—Not if he is a good laadlord oud the tenant is reasonable.
- 133. Q. It would be dangerous to grant farther facilities?—I think it would be wrong in principle.
- 134. Q. Why, if the improvement is a good one?—I regard it as primarily the duty of the rayat to improve his land. It is chiefly the result of the peculiar system of the district which imposes that duty on the loodlord. I should like to see the abolition of the blacks tenuro in Gya, and nothing but each rents.
- 135. Q. Do not you think that the landlord has the edvantage of a good deal of capital which would otherwise lie, to a certain extent, idle P Could it not be usefully employed in improving the land!—It could be usefully employed in that way.
- in that way.

  136. Q. Another witness soid that if irrigation could be introduced into a district like the Bhabna Sub-division, that the people, including, I understand, the zamindars, would not object to the introduction of a general cess F—I do not agree with that opinion. I think they would strongly object. They would regard it as a violetion of the permanent settlement. Also the advantage would not be commonsurate with the cese levied.
- 187. Q. Da you think that, is spite of that objection, it would be justifiable to impose such a cess if Government were convinced that the adventages were commensurate?—I think it would.
- 138. Q. Do yoo think the advantage could be made commeosurate?—That is a matter for professional opinion.
- commonstrato?—That is a matter for protessianal opinian.

  139. Q. Supposing a tract very imperfectly provided with facilities for irrigation were by means of a protective work placed in as good a position as the Sono Canal area. Would that justify the cess?—Certainly. In my district, in consequence of irrigation, lands, which once paid annas 8 are paying Rs. 5 to Rs. 7 a bigha, and one zamiadar in particular teld me that a villaga which once brought him in only Rs. 8,000 naw brings him in Rs. 18,000. In such instances as that the imposement of a cess by Government would be instificible.
- 140. Q. Another sobject. Do pains occasionally lead into ahars?—It is not comman. Ahars are intended for high lands which cannot be irrigated by pains. Occasionally a pain is led into on ahar; then only for conserving.
- 141. Q. Can more water be stored by the construction of more chars far the purpose of receiving water from the paint?—Yes.
- 142. Q. With regard to disputes about the rights of water in different parts of ofreams, do you thick it would be advantageous to frame a record-of-rights?—It would be an excellent thing. It is a proposal that has been frequently made by me in conversation, but it has nover gone up to Government.
- 143. Q. Do I noderstand that you would enforce the payment for labour on pains by going to the Collector ta undertake the repair and to charge the cost provisionally to the zamindars? Woold it not be preferable to levy a cess

950

er:0 }

and that Government should do the repairs?—I would rather give the zamindar the opportunity of doing it. If Government were to levy a gess, it would mean getting a permanent establishment for the work, and our experience of establishments is that they are a source of harusament. and annoyance to the people.

144. Q. There is no danger of the zamindara doing the repairs inefficiently !—If they did, the Collector should have it efficiently done. It would be for him to eee it officiently dono.

- 145. Q. He would require an establishment for that, I suppose?—Yes, it would require an increase in the sub-ordinate executive, but not a very large or unmanageable
  - 146. Q. Zamindars, in many cases, would not comply with the orders of Collectors?—Not, if they know that the Collectors have authority behind to enforce them.
- 147. Q. As for commutation of theoli lands, would you not fear that the people would dislike each rents?—They would welcome them.
- 148. Q. Do they not find that a produce rent serves them better, having reference to fluctuations of the seasons ?-In the case of some zaminderis, but not as a general rule.
- 149. Q. In the matter of pains, do you not think it a good thing that Government should take over the management of even some of the very large pains for irrigating a lundred villages for instance?—The experiment might be
- 150. Q. (Mr. Rajaraina Mudaliar.)—In the case of the zamindar whose revenue you said increased from Rs. 8,000 to Rs. 18,000 from the introduction of canal water does he pay a proportionate increase of the water rate?— That I cannot tell you. The rate is primarily poid by the cultivator, but the custom varies. In some cases the ramindar pays half; in some cases nothing.
- (Mr. Allen.)-In some cases the landlerd is allowed to collect from the tenants.
- 161. Q. What is your security from non-occupancy ton-ants?—His cultivation, his non-occupancy right. It is usual in such eases to grant a loan to a combined number of tenants, who are mutually responsible.
- 152. Q. Where an occupancy touant constructs a well at bis own expense, door the ramindar demand an anhanced slane of the produce or raise his money rent?—Where produce rents are in force, a certain proportion of the actual produce goes to the zamindar. So that if by constructing a well a rayat's fields produce a larger quantity the zamindar naturally gets the benefit.
- 153. Q. Does not that tend to deter the mynt from constructing wells?—So for as I know it does not.
- 154. Q. As to prior encumbrances, we get certificates from the registration officer for which no charge is made?— Wo don't get certificates.
- 155. Q. In other parts of Indin the tenants contribute labour to keep certain channels in repair. Does that enstem prevail in zamindari estates in these provinces?—That is a common practice in the Gya District. As a general rule, the rayats carry out these works thouselves.
- 166. Q. Unpaid' In the better governed estates they are paid and in the Government and Wards' estates of course.
- 157. Q. Has the raminder any power to enforce such customary labour f-I know of none.
- 158. Q. (Mr. Muir-Mackenzie.)—What is goam labour? That means turning out in a body to repair a breach for instance.
- 160. Q. (Mr. Rajaratna Mudaliar.)—Would legislation be necessary in the direction of enforcing such customary lobour?—There is no necessity for it.

160. Q. Have not these pains been repeired by village Mr. C. E. A. labour from time immemorial?—I believe sq. In bhaoli W. Oldham. districts it is primarily the zamindar's duty, und I would enforce the execution of their duty,

24 Oct. 02.

- 161. Q. The original construction is borne by the zamindar, but the subsequent maintenance is shared between the zamindar and the tonants?—That is the principal system is vogue in the Gya District. It is regarded as the duty of the zomindar to mointain these works in a propor state of
- 162. Q. It would be regarded us the duty of the zumin-dar were there a record-ot-rights drawn up to-neorows? That would depend upon the Settlement Officer. ectainly suggest it.
- 163. Q. (Mr. Rajaratna Mudaliar.)—Suppose pains get out of order, has the tonant day right ugainst the samindar in the Courts under the Tononcy Act ?—Not that I know of.
- 161. Q. Mr. Mylne said that the zumindars had no facilities for enhancing rents even in cases where they carried out improvements themselves at their own cost. Do you accept that !- No. I would refer you to the Bengal Tenency Act
- 165. Q. In granting leans do you give them in instalments or in one lump?—In instalments for Land Improvement loans.
- 166. Q. (Mr. Muir-Mackenzie.)—How about Wards and Gavernment estates have you made any improvements or ahars?—Mony, and we have been able to extend irri-
- 167. Q (Mr. Allen.)—Would you look at the preamble to the Board's rules for the Agriculturists' Loans Act? There is a distinct intimotion to district officers there that they are not to supersede the mahajans. Has that any effect in restraining Collectors from diebursing money under that Act?—Very little.
- 168. Q. Under the Lands Improvement Act rules Ithink there is no power for Sub-divisional Officers to disburso leans, and under the Agriculturists Leans Act they have power only on delegation from the Collector?—Such powers are always delegated. My Sub-divisional Officers have powers under the Lands Improvement Act also.
- 169. Q. (Mr. Rajaratna Mudaliar.)-Concerning u not known a tennut pay more than his share?-Yes. I have not known cases where he pays more than the landlord pays to the Government, but I have known many cases in which he pays the entire cass. He ought to pay half.
- 170. Q. Hovo you no power to prevent it ?- Wo are powerless to prevent it. The raynts, as a rule, ucquiesce in anch action.
- 171. Q. (Bir. Allen.) You spoke of the commutation of bhaoli tenure into nakdi on a large scale. Would not there be a difficulty in getting the tennuts to combine to keep up their gilandazi? If it were done on the lives I suggested, there would be no difficulty whatever.
- 172. Q. But the legislation you proposed had reference to pains to large works? You would not propose legislation in order to keep up abars?—Yes, certainly I would.
- 173. Q. (Mr. Muir-Mackenzie.)—Would you not require a very large inspecting staff?—Not necessarily. Rayuts would soon complain if a landlord were not maintaining his pain and propriotors also. It would come to the knowledge of the Collector, and he would know when to depute an officer. It would not require a standing army of inspecting officers.

# SECOND DAY.

# Bankipore, 25th October 1902.

WITHEST NO. 9-RAT BAHADUR BAIJ NATH SINGH of Gyn.

(To President in vernacular.)-lice is grown entirely from ahars and pains. Disputes regarding the distribu-tion of water are frequent. It would be a good thing if decisions regarding them rested with revenue officials, who are experienced in auch matters. There should be a right of acquisition of land for private irrigation works, but care should be taken that no injury is done to the adjoining

Rai Bahader Buij Nath Singh. 25 Oct. 02.

# WITNESS No. 10.—BABU MAKHAN LAL CHATTERJI, Deputy Collector, Shahabad.

Babu Makhan Lal Chatterji.

25 Oct. 03.

1. Q. (The President.)—I am the Sub-divisional Officer of Bhabua. I have been there for a year and nine menths.

2. Q. Where were you before !- In Gyn.

- 3. Q. During your time was there any distress for want of water ?—Yes, last year there was a scanty rainfall, for which there was apprehension of scarcity, but there was no scarelty.
- 4. Q. Can you make any suggestion as to what can be done to help the people there as regards water ?—Yes. There are four or five rivers waich come from the hills, and if they were bunded, it would do immense good to the people there; the Karamassa, for lustance.
- 5. Q. Would people be willing to take the water every year, or merely at times when the mins were scanty?— Every year, just as they do at the Sone Canal.
- 6. Q. It would be a very costly work to make a bund on slarge river like the Karamanassa. Would the people be willing that a cess should be laid upon the land of two or three annas au acre on the whole of the land protected—that is a sort of insurance against famine f—I do not think they would necept that. They would be perfectly willing to pay the cost of the water they naid, but over and above that any cess would not be welcome.
- 7. Q. And would they pay as much water rate per bigha as they do at the Sone Canul?-Yes.
- 8. Q. In your Sub-division is the land generally fit for irrigation? -Yes.
- 9. Q. flave you any black soil there—heavy soil?— There is a blackish soil called Lare!? That is fit for enddy cultivation.
- 10. Q. And in the plains is there any soil unfit for cultivation at all?—No, almost every such of land in the Chabes Sub-division is fit for cultivation.
- 11. Q. Is the cultivation carried on now by means of pains and abars ?- There are abars, but no pains. They are not many.
  - 12. Q. Why is that f-Because the people are poor.
- 13. Q. Do not the samuelars make them ?- The ramindare also are puer.
  - 14. Q. What is the usual system of cental? Blanch.
- 15. Q. Sappose the engineers think the Kammrassa acheme too expensive to make, what could you do to encourage the making of abars? Do you think that reverament advances should be given full do not think that reverament advances readily. They have not done so for the last 10 years, except in 18:05-18:07, when there was actual families. They think they will not be able to my afterwards for they are not extrain will not be able to pay afterwards, for they are not certain that they will have good crops.
- 16. Q. I suppose it means going to the brad-quarters of the district for our you give advances?—We can if the Collector delegates his powers to us. An officer gets these powers as soon as the asks for it.
- 17. Q. Hate you no well irrigation?—Very little. It is not the custom in it e Sub-division.
- 18. Q. In much rabe grown ?- Yet-wheat, engarcine, poppy and barley.
- 19. Q. The wheat and the barley, I suppose, get on with the min?—For these also they want true aton.
- 20. Q. Why should they not do it with welts f-That is not the custom. It is also expensive.

  21. Q. Is the water very deep below the surface f-Not very deep, but they no wells only for poppy and cane.
- 22. Q. A well ke-ps water going for a much longer time than an ahar !- Yee, but they will not take to n.
- 23. Q. (Sir Thomas Highars.)—Do they grow much poppy !—I suppose atout 20,000 acres.
- 24 Q. And they depend now entirely upon the rain?-Yes, and wells. 25. Q. They get good crops now : why would they lake water from a canal ! - If they got sufficient water, I sup-
- pose they would be able to irrigate more land.

- 26. Q. But would they over want the water for rabi ?-Not in good years; but the good years are so very few. For the last ton yours, I suppose, there have been only two or three good yours.
- 27. Q. Would they pay a coss for the sake of hoving a coal if the land-cover guaranteed to contribute? It would be a great safety for them?—I think they would guarantee that they would take the water, but they would not pay a cess.
- 28. Q. But suppose it is a very wet year, they will not take it and will not pay for it. Will they guarantee to pay for it whether they use it or not !—The lease system covers them. In one portion of my sub-division, in the north-east corner, there is an area of about 17,000 ares which is irrigated by the Sone Canal, and they have nover refused to take water for the kharif as well as for the rabi.
- 2D. Q. Sometimes the people do not take the water at all for the rab; how do you account for that? There are 120,000 acres of average rab; on the Bone Cansi, and sometimes at falls to considerablyles?—But we have 70 or 75 per cent. of paddy land in our Sab-division. They would always take it for puddy. And they would take it for rabi too, for in every village, there is both paddy and rabi land.
- 80. Q. (Mr. Muir-Marlenzie.)-At first water scoms to have been taken up rather more sparingly in the earlier years than in the later on the Sone Canal. Would the same sort of thing take place in Rhabus f Would tley heritate to take mater f—No. They are anxious to have it. They have seen their neighbours taking water and the advantages they have derived from it.
- 31. Q. Have you generally naked for powers for takeri?
  -Yes. This year I granted forms to some tenants.
- 32 Q. How many altogether?-About Rs. 210 or Rs 250, each loss amounting to about Rs. 5. That is for eved and cattle. There is no demand for akars or wells or works.
- 33. Q. Have you ever tried to create a demand f-As far as I could, but they would not listen.
- 31. Q. What about the disbursement of these leane? Did you take the mency with you and disbure it on the spat! The tenants exise to the head-quarters of the Subdivision and I disburred the amounts myself to them.
- 35. Q Do not you think you could have got till of more money if you had disbursed it, in camp f-Yes; but these were all tion-mount estate tenants. I have not advanced ontside that this year; only in the familie year.
- 26. Q. Having taken a braness in the famine year, might not the people have been more disposed to take them than before the famine !- At may rate they alld not come.
  - S7. Q. The familie less made no difference ?-No.
- 18. Q. (Mr. Reservices Mudalise.)—Do you think the tenants preferred to borrow from makejune!—I do not think they did either.
- 19. Q. (Mr. Muir-Mockeusie.)—Is there not much indebte muss?—There is, but they are indebted to the ramindere.
- 40. Q. (Mr. Rajaraina Mudalier.)—Do the ramin-dars tend out large sum, ?—Thry do not lead out much men y; they advance for a ed and cattle.
- 4t. Q. Supposing a lith of rupes were glaced at your deposal and you were allowed further powers to grant lime, would you be able to push them full do not think I should be able to distribute all that money. Less year I tried to induce several similars to take lears, because there was apprehension of searcity, but they would not come for them.
- 32. Q. Is there seepe for improvements for above and pains in your Sub-division?—Not for fains; above might be increased, but the zemindars are so very poer that they heditate even to take money from Government, as they are so uncertain of creps.
- 43. Q. But it is principally in such cases that the construction of ulture would be advantageous?—But it is not the rustom.

# WITNESS No. 11 .- Band Chriten Burs Sanat, Ziminder, Shahabad.

- 1. Q. (The President.)-In what part of the district are Babu your lands?-In Piro, Nanour, Panwar and Arrah Pergun-Chutter Bhuj Sahai, pahs.
- 2. Q. Are these districts irrigated by the Sone Canali-25 Oct. 02. Largely.
- 3. Q. Have you say lard in the unirrigated part of the district?-Yes.
- 1. Q. Is the difference very great in the value of the land where it is irrigated and where it is not i-It is. I cannot gire any exact figures.

- 5. Q. How much?—A great part of my dietrict is guzashta lands, boldings for fixed rents or occupancy holdings. There is very little chance of an increase of rent in such cases where the nakdi system prevails, whether the land is irrigated or not. But in bhaoti tenure the benefit is shared beth by landloid and tenent.
- 6. Q. But where the nakdi system prevails, does not the landlord obtain any benefit?—Not where there is guzashta. In one sense it means land which rayata have had from the time of the permanent settlement, and another sense of it is occupancy rights, having a field mero than 12 years.
- 7. Q. Suppose canals were made in the Bhabna Subdivision, do you mean to say that the zamindar will not be able to get a higher rent for his land?—Not where there is nakdi with guzashta right. Of course the bulk of the land
- 8. Q. Do the Sone Canal arrangements work satisfactorily generally?—Yes.
- 9. Q. Can you suggest my improvements ?—I have heard from my own tenants that they were not able to get water; not thet it was refused, but that the authorities could not grant applications.
- 10. Q. Do any of your lands depend upon ahars or pains, and not upon the Soue Ganal?—There are no pains in Shahnbad District at all. There are ahars; some in fairly good condition; others neglected; the latter in Bhabua mostly, where irrigation works are argently wanted.
- 11. Q. Is that because of the poverty of the rayar or laziness?—The properties are always being put up for sale for arrears of Government revenue.
- 12. Q. Would not these men derive benefit by horrowing money from Government? They do not appreciate that much. There are difficulties in receiving it in time and the uncertainty of having good erops and their inability to repay with case. It may be a losing centern after all.
- 13. Q. Do you think the system of recevery is too severe? -It is not at all suited to the people of Bhabua.
- 14. Q. Can you suggest any change in the system ?—I am not a believer in the takevi system at all.
- 15. Q. (Air. Muir-Mackenzie.)—Can you tell me whether the nakdi system was generally in force over the Sono Canal area before the Sone Canal was epened?—In my estates the nakdi system largely prevails. The management was not in my hunds before the Sone Canal was opened and since my time there has been little commutation. The people prefer the bhaoli.
- 16. Q. Where nakdi rents prevail the landlord has extreme difficulty in procaring any enhancement of rent?-Very
- 17. Q. Is he on that account deterred from making improvements?—Certainly.
- 18. Q. Section XXX, clause (c) of the Tenancy Act, says that the landlord of a holding on a money rent may institute a suit to enhance the rent on the ground that the productive powere of the land have been increased by an improvement effected by or at the expense of himself?—Then that has to he established to the satisfaction of the Civil Courts.
  - 19 Q. Is that a difficulty ?-Yes.
- '20. Q. Whence does the difficulty arise? If a landlord constructs an akar and lo is able to show that it greatly increases the yield of the land, that ought not to be a very difficult point to prove?—If the akar be new altogether, it will not be a difficult matter, but only in cases of throwing up earth-works or making gilandazi, the tenant will say that it is the duty of the laudlerd to keep up repairs and for simply doing his duty ho is not entitled to noy enhance-. mont.
  - 21. Q. Would you prefer to see any pewor given to the Collector to regulate such cases f—Yes, because from my own experience I can say that if one has the papers of the Collector, it is not difficult to prove the improvement in Court.
  - 22. Q. The amennt you can demand has not been much increased by the introduction of the Sone Canal, but has it not been made considerably more secure? You have much less difficulty in realising the rental than before !- Certainly.
  - 23. Q. What is your great objection to the takari system? -The full amount does not reach the tenant. I should not be surprised to hear that not even a quarter has gone into
  - 24. Q. It sticks on the way ?-Yes, in various places. Then, again, the feeling of uncertainty as to the crop.

- 25. Q. Any other objection?-It may be that the money that the musts borrow is semetimes used on other objects than irrigation purposes, and then they are liable to have it Bhuj Sahai. summarily recovered.
- 25. Q. Do your tenents depend on you for advances for seed and cattle ?- No, because my tenants are in the canal area, and do not require it, being well off.
- 27. Q. Do your tenants make wells at all in the irrigated lends !--Very seldom.
- 28. Q. If they did, would not they be able to supplement the canal water usefully?—I am airsid not. Irrigation by wellsie not known in Shahabad; it is not suited to paddy cultivation, and only to a very limited extent for rabi. It is not the having a well that will surmount all the difficulties. The cost of working is conveyed. You will have to ties. The cest of working is enormous. You will have to hire bullooks and inear other expenses.
- 29. Q. Is there no well irrigation for valuable crops?-For poppy, yes; very ficely.
  - 30. Q. Is the canal not used for it ?-Not much.
- 31. Q. (Mr. Bajaratna Mudaliar.)—Supposing the loans were disbursed through the zamindars, would not that remove the difficulties to which you refer?—Matters would
- 32. Q. Could not the samindars be trusted to see that the tenants got the full value ?- The majority of zamindare ore net educated enough; they do not understand the duty they owe to Government and to the raigats. That would be a very bad step.
- 23. Q. There is said to be difficulty in getting the Courts to grant bigher rents f-Fer eld works. It is the duty of the zamindar to maintain irrigation works in an efficient state of repairs. There have been no new improvements. But if tho tenants enter into a contract respecting repairs, there is no difficulty.
- S1. Q. Under the bhaoli system does the zamindar pay any portion of the water-rate to Government where the works are constructed by Government?—Yes, when a joint application is made beth by the lendlord and the tenants the landlord is bound to pay.
- 35. Q. But in nine cases out of ton the zamindur will not join in the application?—Yes, but frequently now the tenants recover half the portion from the zamindar privately. So far as I know zamindars do pay, but not to the canal authorities.
- 36. Q. If the zamindar refuses, can the tenants recover?
  —Yes, for good done to the zamindar, under section 70 of the Contract Act.
- 37. Q. Does the tenant contribute any portion of the cost of repairs to ahars? - By contributing labour in como places, by the labouring classes, not Brahmans and Chhatris.
- 38. Q. Have you may power to enforce this customary labour f—No, but they think it is to their advantage to repair ahars; and there is no difficulty at present.
- .39. Q. (Mr. Allen.)—Is there any custom in Shahabad before a rayat makes a well of paying saluami to his landlord?—I do not know of any instance, but I should not be surprised to hear of an unscrupulous landlord domanding it.
- 40. Q. (Mr. Rajaratna Mudaliar.)-It is not a case of unscrupulousness; it is a nazar, a mark of respect.
  - 41. Q. (Mr. Allen.)-And for taking so much land.
- 42. Q. (Mr. Rajaratna Mudaliar.)-In your own estato do you pay any portion of the water-rate?—I have paid in some coses.
- 48. Q. (Mr. Allen.)—Your tenants have not applied for the commutation of bhaoli rents. Is that due to the fact that they have to pay ne pertien of the water rate?—Net so; but because they pay according to the yield, taking the risk of good and hed years.
- 44. Q. As regards the zamindars of Bhabua ?—They are very poor. They have been sold up. They have become poor by extravagence, and enormous amounts are spent in marriages and deaths.
- 45. Q. Hew do they compare with those of the Sone area? -They are worse off.
- 46. Q. Is it not because they do not get their rents in so well?-That is one reason.
- 47. Q. About landlord's improvements; under section 88 he can register an improvement ?-Yes, but they do not do that largely; mestly on account of ignorance of the prevailing law, and also because they do not take the trouble and do not eare.

Babu Chulter

25 Oct. 02.

- 25 Oct. 02.
- Babu

  Chutter

  Bhuj Sahai, ground of improvement and has shown n register of the improvement P—I think not.
  - 49. Q. Would he have any difficulty in getting a decree if he could prove that his improvement was registered ?-Not in
    - 50. Q. If a landlord can get a raigat to agree to an

chlancement of rent on the ground of improvement, he can do so by contract?—He can.

- 51. Q. And also before making his improvement come to an agreement with the raigat to pay an enhancement if the improvement is carried out?—Yes, and there is generally an understanding to that effect.
- 52. Q. As regards forced labour on bunds, is it enstomary for the zanoindar to feed the labourers whilst working?—Yes, that is an equivalent of wages.

## Copy of a lotter from the Hencurable Bahn Churren Burs Sanat, Arrah, dated Arrah, October 1902.

I was examined as a witness before the Commission on the 25th instant at Bankipore. One of the questions raised in my ovidence was, whether there was any difficulty in obtaining a decrea from the Civil Court on the ground of an improvement effected by the landlord. I stated that there was a great difficulty, and this statement was made larving regard to the provisions of section 33 of the Bongal Tenancy Act which controls clause (c) of section 30 of the Act pointed out to me by one of the Honourable Members of the Commission. Each of the clauses of section 33 imposes a limitation on the question of the amount of enhancement and minimizes the measure and chances of success in a suit for enhancement of rent on the ground of an improvement. The difficulty is further enhanced by the provisions of section 50 of the Act, which enects that the rent of a raisest shall not be increased if he has held the land from the time of the be increased if he has held the land from the time of the

permanent settlement without any variation in the rent except on the ground of an alteration in the area of the holding; and under sub-section (2) of the section it shall be presumed that he has so held if it be proved that he has held at a rent which has not been changed during the twenty years lumediately preceding the institution of the suit. No doubt this presumption is relutiable, but to rebut it is a Herenlean task, and if he fails to rebut, there can be no enhancement, as the rent of only an occupancy rotat can be enhanced under the law and not of the raiyet who is holding from the time of the personnent settlement. On these grounds I sald in my evidence that enhancement on the ground of an Improvement was attended with difficulty. I have the honour to request you to be so good as to lay this before the Commission for consideration.

WITNESS Nos. 12, 13 AND 14.—BADE NABSING SAHAT, BART GEPAR SINGH AND BURE RASE BADAR SINGH, all ramindars of Sub-division Ilbahua, District Shahabad.

Balut Narsing Sahai, Singh and

- 1. (The President.)—There are few abars in Bhabus and they are in had repair. The people are very root and cannot afford to construct abars. Both ramindats and Babu Gudar raisuls are poor.
- Singh and

  Babn
  Borrow from Government f—Because they would not be in

  Ram Balan a position, they fear, to topay the loan, tecause if their

  Singh. crops full, they will not be able to repay thelean

25 Oct. 02.

- 3. Q. Is not that rather unreasonable? With a new abor the people would be better off. Suppose the Sinkar takes it look in 20 years !- They fear that these rument may not get their money back.
- 4. Q But the raisest would get a lot back. If they had water by canal, would they take it every year!—Yes, they are greatly vanting water.
- 5. Q. And would they pay as high rates as on the Sone Canal !- Yes.

- 6. Q. Suppose the Sirker found it costs too much to make great counts for Bbabna, the yen know of any way in which afters could be encouraged?—There will be a difficulty in gotting water, because the present proprieters will not allow water to accommulate in i ew uhars.
- 7. Q. (Mr. Mair-Machensie.) Habars arounde without any large nocks or canals, will they fill from the existing minfall?—In a net of the years, not.
- b. Q. If they had water, would they greatly forcase the rice area f -- Very much.
- 9. Q. Is there much waste had upon which they would now it?—About one-righth of the whole area. It nould In that care be cultivated.
- 10. Q. (Mr. allien)—The Karamaa-a comes down in field; does it not!—Yes southmes.
- 11. Q. Does that interfere with your making abore ?-

WITNESS No. 15 .- Mm. UPPNDBA NATH GHOSH, Deputy Collector of Arrali.

Mr. Urendra Nath Ghosh.

- 1. Q. (The President.)—How long have you been Deputy Collector?—Since 1890.
- 2. Q. You must have moved about a great deal among the cultivating classes and heard a great deal of what 25 Oct. 02. they said. Are they contented with the canal management, or do they feel it hard upon them?—They are con-
  - 3. Q. You make calculations on the measurements given you by the canal authorities, and you are under the orders of the Soperintending Engineer ?-Yes. Calculation of rates are made by Divisional Canal Officers.
  - 4. Q. Are the inconnements finished by the time the crop is ready?—Generally.
  - 5. Q. So there are no disputes as to whether the land has been watered or not?-Very few.
  - 6. Q. Are there many complaints as to incorrect measurements ?-No.
  - 7. Q. Is the canal irrigation popular f-Yes. It is apparent from increase of leases, in cases of long leases, seven years; it is increasing, that is, for paddy. The increase is striking in Areah Division.
  - 8. Q. (Mr. Muir-Machenzie.)—Is by far the larger amount of revenue collected in leases F—Yes, about one-third of the whole demand is in ecison leases, and nearly two-thirds in long leasur.
  - D. Q. Da you think the rates could be raised?-I believo long leaso rates could be raised, and that the people

would pay them. At present it is its 1.0 per bigla, or Rs. 2.8 an acre. That will be raised in ICO3 to Rs. 1-14. which can be raised still.

- 10. Q. In riveh water wasted?—No. With the season least other utilize the last drop of water they get.
- 11. Q. Are the water-cont-ce kept in repair ?-Yes.
- 12. Q. Don't the carte ent into the water-courses and let the water flood into the roalf-No.
- 13. Q. (Mr. Rujarotta Medaliar.)—What is your present staff.—The present staff is a Deputy Collector in charge of the returne division, two Sub-Deputy Collectors. There are 7 circles, and each circle is under a rilladar who supervises the work of collection, and there are 30 talksildars. Each talksildar is given two poons to make the collection. There are clorks and mohurrers, peons, and an accountant for office work.
- 11. Q. What is the total arm irrigated ?—I have no got figures with me. (.1 coice: It averages about 450,000 Our rentallast year was Rs. 10,69,800.)
- Our rentaling year was its. 10,00,000.)

  15. Q. Would it not be possible to reduce the staff if the assessment is much ever to you with a staff of aming fer measurement. F—The measurement and assessment can better be done by the staff that regulates the water. The mater is regulated by the engineering staff. They know how much is irrigated, and it is better that they should measure and assesse. The tenants are always likely to mislead me, and I must ask the engineer to correct them. That means they must have as much staff as they have at present, except eight or nine amins in each sub-division. present, except eight or nine amins in each bub-division.

- As regards the leass, would it be advisable to extsnd it !—In Madras leases extend 30 years. The seven years is being worked well. Unless all conditions are the same, the porrod of enrrency of o lease cae't be the same.
- 17. Q. Do not the raiyats object to sudden changes?—
  Not much. When you will come to the maximom point you can stick at it. Seven years is long enough. The enhancement, when it is mude will be made according to their income; if there is no increese of income, there will be no increase of the rates. inorcase of the rates.
- 18. Q. Do not you think your establishment might be reduced if the certificate system were more extensively adopted?—We ore reducing our establishment as much as we can. The cost of the collection is now about 6 per cent. The area concerned is too widely scattered for fewer men.

  As it is they do not generally come forward to pay.

  We have no offices and the talisidars would have to go into the villages and beg them to pay their rates. The certificates we have issued for non-poyment of rates have been reduced from 10,000 to 300. The Commissioner or Collector does not think it advisable to collect hy certificates so long as it can be collected by other means. If they do not pay the

rates regularly, the water is stopped. The greatest trouble is to reelise from the petty zamindors.

19. Q. In Mudras the collecting staff is not much ?- I am Nath Ghose. not aware of the Madras system. In a compact area the collection one be made with less staff. The orca of Shah- .25 Oct. 02. abad District slone is 4,000 square miles; excloding 1,300 square miles of Bhabne, which is not irrigated, the erce to be traversed for collection is too large for the staff.

20. Q. What do you think if the collection is given to zamiodars?—I did not try the system. All that I can say is that all zamindors do not pay their laud revenue without the son-set low being brought ioto uss; collection of cess through them is not a success. through them is not a success.

21. Q. Whot do you say to the transfer of the department to the Collector?—The department is working well as it is, as far as I con sec. The Seperintending Engineer himself shows anxiety for successful irrigotion.

22. Q. Do you receive any comploint about supply of water? - Very very seldom. The onlitivators may be oursious for more water, but the supply given to them is sufficient to mature their crop.

WITNESS No. 16 .- Mr. J. H. TOOGOOD, Saperioteoding Engineer, Sone Circle.

(Replies to printed questions.)

I.

## A .- GENERAL.

Paragraph 1.—To the districts of Shahahad, Pntna and Gya. Hove been in charge of the irrigotion works, reads and buildings as Saperintending Engineer, necessitating trovelling throughout these districts.

Paragraph 2.—The average rainfall noted below is the average recorded of 22 statious in these districts for a period of 20 years, i.e., from 1880-81 to 1899-1900:—

				Inches.	1			Inches.
April				0.15	October			2.61
May		•		1.13	Novembor			0.29
Jnno		•	•	6.80	Docember		•	0.21
July	•	•	•	12.11	January		•	0.82
Aogust	•	•	•	11.82	Fobruory	•	•	95'0
Septemb	er		•	6.76	March .			0.35

Average annual total = 43.61 inches.

Paragraph 3 .- (1) Not in the plain tracte of thess districts.

(2) No.

17

- (3) For the cultivation of the stople foods of the districts the lands are not manured. Only valuable crops ere manured, such es pototoes, poppy, segereene and vege-
- (4) Generally the soil of these districts is suited to irrigation of either rice or rabi.
- (5) Extension of irrigation in these districts would be dependent on the supply of the rivere: the sopply in them is entirely dependent on reinfull: there ere no snow-fed streams. The erops in these districts are mainly dependent on the storage of the reinfoll and its favourable distribution. Rice is the principal erop and is the staple food of the people. The important periods when water is necessary for this crop are—
  - (1) from the middle of July to the end of August (the transplanting season), and
  - (2) from the last week in September to the end of October.

Failore of minfall during either of these periods materielly affects the eatturn of the crop. During the last decennial period from 1890-91 to 1899-1900 the reinfall was for four years below average; and in two years of the romaining six. olthough above the average, the rainfall was unfovourably distributed.

. (6) On the part of the cultivators there is a lack of capital for initial expenditure, and I do not think the zamindors would come forward with copital for estrying out any extensive scheme of irrigation. Where lands ore under bhaoli or "crop-divisible" system the zamindors make ahars and circuitons embankments to rotain the raiofall for irrigation purposes: this is dene more in the Gya and Potno Districts where large areas ero nader this systom.

(7) No. I think the oultivators would be willing to pny enhanced root or revenue if they had the security of their crops assured by irrigation.

(8) The provisions of the Bongal Tenency Act are applicable in these districts. I have not heard of any complaint against this Act on the part of the cultivators: the zamindars, I believe, have objectious to it.

Paragraph 6.—I do not think so. There is o vory strong desire on the part of the people in these districts to have irrigation extended, but they do not quit their homes for the irrigated tracts, nules they are reduced to extreme poverty. Applications for irrigation lesses for large areas have annually to be refessed for want of water in the Soos Canals. In 1899-1900 applications for 40,412 oeres were refused.

B .- CANALS OF CONTINUOUS ELOW.

Paragraph 7 .- (1) In these districts, from rico-fields irrigated from the ennals, o pairs or eatch-crop is invari-obly secured of kesari, haseed and gram: the value of the produce would range from Rs. 8 to Rs. 12 per aero.

(2) The sugarcnae enlitvetion has been doubled since the construction of the Sone Canals: its extension is limited to the het-weather supply available.

(3) (a) Ten per cent.;

(b) Thirty to fifty per cent.;

(c) Three to nine times the yield ;

in fact, any unirrighted crops would yield nothing whotever.

Paragraph 8 .- (1) Rs. 4 per sere.

(2) Rs. 20 to Rs. 30 per nere.

Rs. A. Paragraph 9 .- (1) Long-term leases (mninly taken for kharif).

Kharif scason lenses RabiHot wcother (sugarcanc) 4 0

These are the rates on the Sone Canals in 1901-1902 onid to Government by the cultivetors of the land and maid for the actual area irrigated.

(2) The owners arrigated.

(2) The owners have no legal right to enhance the oultivators' rents on account of the onnal irrigation, hat undoubtedly they have done se, and rents for makdi lands have been doubled and, in some cases, trobled in Shahahad; where rents were formerly Bs. 3 an aere the on livetors now pay Rs. 6 and Rs. 9 on an average. The owners of bhaoli lands have, of course, participated in the increased yield of the fields due to irrigation.

(8) Nothing beyond the water-rates mootioned above is paid to Government.

Paragraph 10.—The water from the canals is brought to the fields through "village chonnels": these are generally constructed by the villagers orranging amongst themselves collectively. Where the villagers are unable to construct them, opplication is made to Government for their coastruction, the cost being defrayed by subscription

Mr.

Upendra

Mr. J. H. Toogood.

25 Oct. 02.

Mr. J. H.

from the applicants; in these cases there is no recoupment. Where channels are constructed by zamindors or thikadors, village channel rent is realized by them, the rent being 25 Oct. 02. lixed by the Canal Officer.

#### -WELLS.

Paragraph 34 .- (1) Thirty feet.

- (2) Percolation.
  - (a) No.
  - (b) Most probably.
- (3) A well, 3 feet in diomoter, with 10 inches steining and 36 feet depth, was made at a cost of oboat Rs. 60 to a villager in Arrab.

A well, 6 feet in diameter, with 10 inches steining, 42 feet deep, and from rods driven down fo feet into the seil, was made at a cost of Re. 200 in Arrah by a villager.

- (4) About 60 years, if well constructed.
- (5) By (a) latha, or lever ond bucket.
  - (b) moth, or leather beg worked by bullocks.

(6) and (7) From a 3-feet diameter well, as abovo, in which two lathas are worked, 10 bighas may be entirated; from a 6-feet diameter well, as above, in which a moth is worked, 15 bighas may be cultivated.

Paragraph 38.—In these districts neither under (1) nor (2) are there difficulties; wells can olimost everywhere bo dng and constroomd.

Paragraph 39.—Yes. A water-rate on the area commanded abould he charged to recoup Government for the cost of construction.

Paragraph 40.-Yes. They irrigate from 2 to 3 acros by advancing n small sum to the villegers towards their construction.

II.

The Sone Circle extends over the districts of Poten, Gya and Shnhanad.

As regards Patna, the western portion is protected by the Sone Canals. In his report on the familie of 1896-97 tho Commissioner remarked-

"No parts of this district were ever seriously in denger: the rainfull was not so deficient as obswhere, and every available drop of water from the Sone Canuls was utilised Fears were at first ontertained for the Islampor Thann in the Bibar Sub-division, but these econ passed airay

The Bihar Sub-division again is divided into hills in the south and the low country to the north; the whole sub-division is intersected with etreatus, and the greater part is provided with a system of reservoirs (ahars), some of which are filled with rain-water and natural drainage, while others are replenished by damming the rivers. An elaborate system of conduits (pynes) conveys the water from the rivers to the reservoirs and again to the fields of the oultivotors.

This district is extraordinarily well supplied with communications

As regards Gya, the Commissioner in the same report

"Gya was is oven less danger of famine than Paina: the whole of the western border is protected by the Sone Canals, and almost all the remainder by the local system of reservoirs and channels obove alluded to."

As regardo Shahebad, the greater part of the plain portion As regardo onaneusa, the greater part of the prints portion is protected by the Sone Canals; the unprotected tracts lio south and west of the district in the Bindan Sub-division and part of the Sassoram Sub-division. With reference to this district and these tracts, the Commissioner of Patna in his Femioc Report remarks

"18. This district also suffered from the general rise in prices, but awing to the stocks generally held, no part of it was really distressed except the extreme south-west corner comprising the Bhabne Sub-division and a part of that of Sassaram with an arco of 1,301 equore miles: this tract consists of two shorply defined portuns—the hills and the plams.

19. The whole of the couthern part of the Bhabna Sub-division, and much of the conthern portion of Sassaram, is occupied by the Kaimor innge of hills which cover an area of 700 square miles, with a population of about 20,000 persons, thinly scattered over an undulating ploteau covered with forest for the most part. A great portion of this area

is occupied by Government estates. Here the crops are poor and precarious, and depend greatly on the rains, for with the exception of a few village wells, and still fewer tanks, there is no prorision for a water-supply. Food-supplies are brought up from the plains through difficult passes which, always impassable for wheelechtrafite, become closed even to pack animals when the monsoon case sets in. There was a serious failure of crops all through the hills, and it was feared that unless early steps were taken to bring plenty of grain on to the platean, there would be real want of foud: it was therefore mranged that the local market should be empilied in good time through a graio-dealer appointed by the Collector. Rents were surpended in the Government estates, and considerable advances were given to the cultivators both for wells and seed-grain: lestly, a little gratuitous relief was administered, and three relief works were opened for about three months. Owing to the showers in the rold weather, and probably from the existence of private stores, the people passed through the ordeal better them was at one time expected.

20. The remainder of the distressed tract in this district is occupied by Government estates. Here the crops are

20. The remainder of the distressed tract in this district comprised the plans part of the Bhabus Sub-division and the Chenary outpost of Sassaram, and is again divided fato two parts lying, respectively, north and south of the Grand Trank Road. The part to the north was nut severely affected, and test works which were started in Octobor were affected, and test works which were started in Octobor were shandoned by the end of that month, and not afterwards resuncd. In the countern pertien lying, between the hills and the Grand Trunk Itond the distress was much more acute. This tract is chyracterised by very poor soil, growing bardly muthing but aghani rice, which in 1996 was a total failure; there is little or no irrigation. Moreover, the cultivators are hexport and imporerished, and the hysique of the people is poor and their general condition bad. The grain marts of the sub-division, such as they are, are supplied either fram Sassaram, some 28 wiles from Bhabua along the Grand Trunk Road, or more largely from the Zamania station of the East Indian Railway, which is the Zamania station of the East Indian Railway, which is at the rame distance from the same place. Relief works were opened here at the end of October and were continued were opened here at the end of October and were continued till August 1897; much was expected from the Moghulsern Railway running clong the north of this tract, the construction of which was commenced in 1895, but for various reasons it failed to attract employment. Owing to the fullure of the Sub-divisional Officer of Bhabna to give early and complete information, the people ran down a good deal and relief works and gratuitous relief works were organised by the Collector in February, not a day too soon. Gratuitous relief was greatly curtailed by the middle of September, and ceased allogether by the end of that month."

With reference to paragraph (1) of the memorandum of points to be considered by the Irrigotion Commission in Bengal for districts or tracts liable to famine or scarcity, I shall confine myself to supplying information as regards the Bindous and Sassaram Sub-divisions which were affected in 1896-97.

(a) Gross and cultivated area, average gross area annualty under crop.—This is shown in the following statement :-

Sca-D141	)103f		Gross eres lu acres.	Totat e-timaled cultivaled area in	Approxi- male normal area under winter	area :	nue in
			BCCCS.	neres.	1900.	toot.	
1		2	3	4	8	a	
Eastaram Dhabea	•	•	832,640	518,470 470,000	\$53,000 313,500		153,390 280,000

These figures are obtained from the final report on the winter rice crop of 1901 published in the Supplement to the Calcutta Gazette of 11th December 1901.

(b) The probable proportions of the cropped area irrigated by Government verigation works, by private or village works and by wells, respectively.—About half the area of the Sassaron Sub-division is commanded by the Government irrigation works. I have me available information as regards the proportions irrigated by the other sources mentioned, but os noted in the Commissioner's famino report, these sources of supply are very limited.

(e) General configuration of the country, character of the soils and their suitability for irrigation.—The

southern portions of these sub-divisions are occapied by the Kaimor range of hills, covering an area of about 700 square miles, the plateau is undulating, thickly wooded; and sparsely populated. The morthern portions from the bills to the Ganges present the ordinary flat appearance common to the valley of the Ganges in Bihar. Those are extensively under outlivation and fairly planted with trees. The soil is chiefly alluvial; there is a considerable area of kewal soil (n brownish black clay) in the affected tracts in which aghani or winter rice, the staple food of the district, is sown; but as it is dependent on minfall, it fails or yields a very poor crop four ont of seven years. If irrigation is provided, there is no doubt in my mind that it will be highly appreciated and much sought after, and that the experience of the Sone Canels will be repeated, viz., that rabi lands will be convorted into rice fields.

(d) Extent to which cultivation is dependent on artificial irrigation; statistics of annual and monthly rainfall.—
As already stated, the rice (principal crop) fails or yields but a poor return in foar ont of seven years. Owing to the insufficiency of the rains, only small areas as are under ahars (embankments thrown across the drainage lines) coming to maturity. The accompanying two statements show

Appendices A, B and C. at the head-quarters of the Sassaram and Bhabua Sub-divisions for the last 21 years. It is curious to noto that the average is almost identical. A third statement also is appeaded showing the rainfall at Basawan, midway botween Sassarum and Bhabun, and lying about 8 miles further north.

- (0) Years in which reliable records show that there has been (1) famine and (2) severe searcity not amounting to famine.—Thore was famine in 1896-97 and, owing to the seauty rainfall, searcity in 1828. There want have been a considerable failure of the rice crop also in 1883, 1887, 1891, 1892, 1895, 1898, 1899, 1901 resulting in the impoverishment of the received. ment of the people.
- (f) Stople crops for each main class of soil; times at which sown and reaped; what are the crops which require which sown and reaped; what are the crops tonion require irrigation and how many waterings do they require and at what times of the year?—Thu staple or main crops sown come under one of the following seasonal classifica-
  - (1) Kharif, aghani or winter rico;
  - (2) Rabi or spring crop;
  - (3) Bhadoi or autumn crop includes autumn rico:
  - (4) Sugnrease (porenuial).

The lands are classed necording to the crops they bear, viz., (1) rice or paddy lands, (2) rabi lands and (3) sugarcane lands. Bhados crops are usually grown on rabi lands.

Paddy lands are divided into two classes, viz., (1) these nown in sandy lands (locally known as bangar, bal and balmat), and these sown in clayer and learny soils (locally known as kewal, kerail, doresa). The former bear only one crop in a year, viz., paddy; the inter bear a eccond or catch-crop in the spring, such as kesari, gram and linseed, ctc., sown just before the paddy is out.

Rabi lands ore of the clayey and leamy soils: that known as kerail is best suited to the growth of rabi. They are also divided into two classes; thuse which bear cerents only and those (the better lands) which are double cropped, with an antumn (bhadoi) orop as well, such as marua, kodo, makai and sixty-day rice (serah sathi).

Sugarcane is sown principally in the clayey and loamy soils known as kereal nad dorosa. The fields in which sugarcane is grown are sown with either one or the other of the seasonal crops for one or two years before being resown

with sugarcane. The accompany-ing table compiled for this circle Appendix D. shows the time of sowing and reaping, inigation required and when of the principal crops grown in the country traversed by the Sono Canula.

(g) Utility of irrigation in increasing the produce of the land and in securing it from the effects of a failure of the rainfult.—The crops, especially rice, are dependent on the rainfall; and there can be acceptantive cultivation in the rice crop or even the rabi or sugarcone crups unless some means are adopted to store the rainfall, and irrigate them at the most suitable and favourable times. Unless, therefore, some means of storage and artificial irrigation are adopted, the produce must be adversely affected. In the tracts under consideration the system of ahars or shallow surface reservations but it records constantially storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of country with the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the storage of the voirs exists, but lu years of scanty rainfall they run dry and a vory small area, if any, is brought to muturity; this

failure of crop, as has been stated before, occurs probably four out of seven years. With a systematic scheme of irrigation, such, for instance, as the Sone Canals, and prohably storage reservoirs, sach as proposed for the Karmnassa and Durgaoti rivers, with distributing channels, the produce of the land in these tracts will undoubtedly increase and security will be afforded in the event of failure of the rains. In the famine wear of 1896-97 and in 1901-1902 and scourity will be altorded in the evoat of failure of the rains. In the famiae year of 1896-97 and in 1901-1902 it is estimated that, respectively, not less than 33 and 35 lakbs of manuals of grain were added to the food-supply of Bihar by the Sone Cauals.

Two tables are annexed showing the results of orop experiments from 1897-98 to 1901-1902 since a more entermatic system of experimenting.

since a more systematic system of experimenting was introduced. In the case of rice the results are more favourable to the canals than in the case of rabi.

(h) General measures which should be adopted for (A) General measures which should be adopted for extending irrigation in each district, either by Government or private works.—The coastruction of storago reservoirs in the Karonnossa valley and possibly also in the Durgaoti valley, with a high level canal and distributing channels, are the works that suggest themselves for the irrigation of the affected tracts. The cost of carrying out these schemes would preclude their being taken up as a private outerprise; they would therefore have to be undertaken by Government. undertaken by Government.

Paragraph 2.—Existing Government irrigation works (Imperial).

The Sone Canals. - Particulars were forwarded to the Chief Eagincer with this office No. 4043, dated 3rd October

Paragraph 3.—Proposed new Government works, etc.—There is the Karmanssa project and possibly the Dargacti project. Particulars regarding the former have been fully recorded in Chief Engineer's note on Mr. Maconchy's report, paragraph 114, et eq. As regards the Dargact, its drainage area up to the point where the river debouches into the plains, i.e., about the probable eite of dam, is about 310 square miles. A rainfall of 12' over a squere mile is equivalent to about 28 million onbio feet. In years of extreme drought, from the rainfall retarns of squore mile is equivalent to about 28 million ombio feet. In years of extreme drought, from the rainfall returns of Sassaram, a total fall of 22.5 inches may be anticipated during the kharif scason, of which probably two-thirds or 15° may be stored, giving a total storage of (310×28×1½°) = 10,850 million cubic foot. The following are the areas commanded and irrigable as estimated in Mr. Maconchy's report, page 124:—

		_
Area commanded,	Area of kharef irrigable,	Length of main distri- butaries.
Sq. miles.	Acres.	Miles.
i		
50	10,000	20
50	10,0 )0	12
100	20,000	32
	eomtwanded.  Sq. miles.  i  50	Eq. miles. Acres.  50 10,000  50 10,000

The storage amounting to 10,850 million outio feet, and the aren to be irrigated 20,000 acros, the allowance works out to a million cubic feet for every 2 were which is very ample. Mr. Maconchy considers it safe to count on a daty of 20 acres per million cubic feet, even after allowing for deterioration of reservoir, loss from leakage, otc. cost of the scheme, as estimated by Mr. Macouchy (page 125 of his report), is as follows:

Durgaoti schemo.	
Storago reservoir for 20 cores at	Rs.
Woir across Dorgacti, 1.000 feet at	6,00,000
High-level ranni from weir to Sassa- ram, 16 miles, at Rs. 15.625 per	2,00,000
mile Distributaries, 20,000 aores, at Rs. 12-8	2,50,000
par noro	2,50,000
Total works . ,	13,00,000
Establishment, Tools and Plant and Indirect Charges at 30 per cent.	8,90,000
Total Capital cost	16,92,000

Mr. J. H. Tongood.

Mr. J. II. Toogood.

The cost of the storage reservoir may be accepted. The weir, I do not think, it likely to be more than 500 feet across. The area to be irrigated is about the same on each 25 Oct. 02.

Cost of works.		
Con of works.	Ks.	Rs.
Storago reservoir	6,00,000	•••
Weir, 500 feet, at Rs. 200 .	1,00,000	441
Main high-level canal, 16 miles, at Rs. 6,250 .	1,00,000	8,00,000
Branch canals, 16 miles, at Rs. 4,000	64,000	***
Minor distributaries, 20,000 acres, at Rs. 4	80,000	1,44,000
Total .	9,44,000	9,44,000
Preliminary exponses .	•••	25,000
Total works .	411	9,69,000
Add—30 per cent. Establishment and Tools and Plant and Indirect		
Charges, say	•••	2,91,000
Total Capital cost	• •••	12,60,000

Maintenance charges including revenue management based on the working of Sone Canals=34 per cont. on eapital cost of works, inclusive of establishment.

Maintenance.	_		_
	Rs.		Rs.
Three and one-third per cent. on cost of works,			
cent. on cost of works,			
viz ,	9,69,6	300=	=32,300
Revenue.			
20,000 acres, kharif, at Rs. 2	≥= .		40,000
8,000 nores, rabi, at Rs. 1-8	3= .	•	12,000
	Total		52,000

The net revenue in this case is Rs. 62,000-Rs. 32,300 = The net revenue in this case is us. 52,000—18. 52,000—18. 52,000—18. 19,700, which is equivalent to 1:56 per cent. on the total capital cost. These rates are low, and there is no reason why the rates obtained on the Sone Canals should not be realised in which case the revenue would ho—

			Rs.
20,000 acres, kharif, at Rs. 2-	8 ≠•		50,000
8,000 acres, rabi, at Rs. 2 =	•	•	16,000
	Total		66,000

The net revenue would then be Rs. 66,000—Rs. 32,300 = Re. 33,700, equivalent to 2.67 per cent. on the total capital cost. This project is, in my opinion, deserving of dotail investigation, as likely to be a good protective work, fulling within the scope of the projects indicated in paragraph 3 of Government of India Resolution No. 13—61-16 (Famine), dated 13th September 1901. Its investigation and construction (if found practicable) should follow that of the larger project of the Karmnassa. The net revenue would then be Rs. 66,000-Rs. 32,300 =

- 4. Provincial works .- There are none in this Circle.
- 5. Private irrigation works other than wells.
- (a) Brief description of such works (including field embankments) by whom constructed and controlled, state

of repairs, their liability to failure in a year of drought, obstacles, if any, to their extension.—Under this class in Bhabua and Sassiram Sub-divisions only the ahars em be reckoned. These consist of low retaining embankments constructed across the drainage lives of the country from shallow trenches dug above them forming shallow storage reservoirs from which water is let out by cuts or lifted on to the fields below. The fields them-elves are also bounded on all four sides by small earthen ridges, kiaris, 9 inches to 1 foot in height, which serve to regulate the flow and also to retain the required depth of water. They are generally of small area. The ahars are the property of the zamindars by whom they were constructed. They are either repaired by the zamindars or the villagers: in the former case the ramindars reimburse themselves by the higher rent they are able to reimburse themselves by the higher rent they are able to obtain from the lands which are watered from the ahars. An ahar, it is estimated, can irrigate from 3 to 6 times its An anar, it is estimated, can irrigate from 3 to 6 times its area. They vary much in size. In years of drought these ahars are more or less liable to fail and generally do so if the mins cease early in September, in which case the rice crop under them does not receive a watering in the hathia (1st half of October) and does not mature: ahars exist in nearly all villagers, the zumiodars and villagers being fully alive to their interests for the construction of these ahars.

- (b) Extent to which construction has been assisted by advances from Government concessions, if any, given to the constructors of such works.—In some few instances advances may have been given by Government under the Land Improvement Act, but not generally. I am not aware of any concessions being granted. On these points the Civil Department is better able to give information.
- (e) Obstacles to their extension and possibility of stimulating their construction in tracts liable to famine.—Their extension is not necessary in the tracts under consideration; they exist where necessary. The conflicting and rested interests of cultivators and camindars would probably be an obstsole to any extension of the
- (d) Can new works of this kind be constructed nithout the permission of Government or without reference to their possible effect in intercepting the supply to either Government or private works ?—I am not aware of any law by which the permission of Government is required in the case of the construction of a new ahar, and so far as I am aware, it may be constructed without reference to the possible effect it may have in intercepting the supply to other ahars; but this is a matter on which the Civil Department is also better able to give information as to ahar rights.

- (a) Districts or tracts in which well cultivation is (a) Districts or tracts in which well cultivation is most largely practised.—Throughout South Bihar wells are need for calivation of rabi, poppy, vegotables and augarcane, as these crops only require light irrigation. Rice requires too much water to be Irrigated from wells. In the tract in the Patna District lying between the East Indian Railway and the River Ganges between Bonkipore and Dinapore which is subjected to inundation from the Ganges floods, and thereby rendered fruitful, I helieve well cultivation is more largely practised than clowhere. Well cultivation is also resorted to in South Bihar in all tracts outside the canal areas. tracts outside the canal areas.
- (b) Averago depth of water below ground surface in each district or tract.—In Patna and Gya Districts about 20 to 30 feet. In Shahabad from 15 to 20 feet.
- (c) Cost of wells used for irrigation.—Wells are of two classes:—(1) Odinary earthen wells (kuañ) either without any protection (kutcha) or having hamboo or carthenware rings from which irrigation is effected with a single lover and bucket (lath). The great majority of wells are of this class. They are about 3 feet in diameter and cost from Rs. 4 to Rs. 16. (2) Masonry wells (laara) vary from 3 to 10 feet in diameter from which irrigation is effected with a leathern bucket (moth) and bullocks or several lovers and buckots. These wells are usually situated in or near village sites and are used by the village community for irrigation of adjoining lands. Cost of the smaller sizes, 3 to 4 feet diameter, vary from Rs. 60 to Rs. 100; 6 feet diameter, Rs. 150 to Rs. 200, and still larger ones from 300 up to 1,000, according to diameter and depth.
- (d) Average area irrigated per well.—This varies not only with the kind of erop grown, nature of soil and dopth of water below the sorface, but also depends on the personal industry of the cultivator and the area of land possessed by him.

The following table is from observations made by Colonel Heywood, R.E., and shows the quantity of water required or one age of the principal crops irrigated:—

No.	ome of	erop.		Number of irrigations.	Water omployed for trigation.	Total quantity of water required.
Wheat Barley Peas Gram Opium			•	3 2 to 3 1 7 to 8	C. ft. 6,800 6,800 6,800 6,800	C.ft, 20,400 20,400 20,400 6,800 47,600 to 54,400

From the small wells (kuań) ½ to 2 acros may be irrigated by one backet and lover. From the smaller masonry wells with a cauple of levers and buckets, or with one meth from 3 to 5 acros, nod from the larger wells working two moth as much as 10 or even 15 acres might be irrigated. The average area irrigated from wells is probably about built the above figures.

(c) Extent to which the supply of water is affected by drought.—The level of water remains fairly constant in ordinary years of drought except in the hot-weather months of April, May and Jone. At this period there is little or no coltivation except that of sugarcane.

(f) Concessions, if any, given to the constructors of new wells.—On this I have no reliable information; the Civil Department may be consulted. Probably in the years of drought advances have been made.

(g) Is it possible or desirable to stimulate the construction of new wells by more liberal advances or concessions?—As a general principle, I think it is better that the construction of the masonry wells should be left to, and devolve on, the zamiodars or landlords who might be encouraged by advances, recoverable in a certain term of years. For the construction of the common kacheha wells the cultivators can generally arrange, small sams, say, Re. 1 or Rs. 2 might be presented them in a year of extreme draught for the purpose of constructing them to save their crops; they seldom last more than a year. This is only desirable in tracts outside the cauni irrigated area.

Paragraph 7 .- Black cotton soil.

T (a) Where prevalent; usual depth; nature of the underlying stratum.—Black cotton sail, such as exists in the Bondbay Presidency and Central Provioces, is not found in Sauth Bihar, though there is a soil in the Chausa Pargana of Shahabad said to approach it. The clayey soils, which are more general and somewhat acologous to black cotton soil, now what are locally known as kenal and kerail. In the Gya District it extends clong both banks of the Punpun river in a varying width of from 5 to 10 miles, and this extends for a short length into the Patna District. In Shahabad it prevails in the west of Sassaram Sub-division and in the Bhabuo Sub-division north of the Grand Trank Read. It varies much in depth of a thiokness not less than 10 or 15 feet. The sub-soil is generally a yellow clay or loans.

(b) Is there any desire for irrigation on the part of the cultivators of such soil?—The desire for artificial irrigation is, I think, shown by the existence of ahars wherever their construction has been possible and likely to be bous-

ficial. Kewal lands are said to be best snited for rice and sngarcane, kerail binds for rabi, but in the canal irrigated areas, in many places, kerail lauda have been brought under rice cultivation when there is an assured supply of water ned an assurance of a profit equal to that of rabi. These lands formerly were recoved for rabi, as they retain moistore very well and produce the cold-weather crops with little or no irrigation.

(c) Extent to which the suitability of these soils for irrigation is affected by their depth and by the facilities for natural drainage affected by the stratum underlying them.—These soils being rotentive of moisture require but little irrigation, especially when their thickness is so much as in these South Bihar Districts, and there is but little, if any, vateral drainage into the sub-soil. Where the thickness of such soils is only from 18° to 2 feet in depth with ounderlying stratum of sud, as I noticed in North Champaian, frequent and heavy irrigation is noce-sary, otherwise the rice crops dry owing to the rapid natural drainage through the sandy sub-soil.

Paragraph 8.- Water-rates and distribution of water on Government work.

(a) Scale of water-rates on major and minor works.— The rates per nore current on the Sone Canals in 1902 are—

	Rø.	A.
Seron years' losse for block areas, all crops between 25th June of one year and 25th March of the next	2	8
Marif senson leases between 25th June and 25th October	3	8
Rubi season leases between 16th October nod 26th Murch following	2	0
Hot-weather season leases between 25th March and 25th June	4	8
Hot-weather season leasos between 25th March and 25th Jone for each wateriog	2	0
When water is available it is also sold by volume.		
Between 1st September and 31st October per calculated discharge of one cubic foot per second for 12 hours	4	0
Botween 1st November and 25th March following for filling ahars per one ochio		•
foot per second for 12 hours	1	0

(b) How is the distribution of water arranged for and controlled?—From the canals and distributaries the water is let out through permanent and temperary outlets icto village channels constructed by the people. The spening and closing of the outlets is controlled by and in the hands of the canal staff. The outlets are worked on the tatil or rotation system, being kept ten days open and five days closed. The size of outlets are now being based on a daty of from 50 to 60 acres per cubic feet per second according to the nature of the soil. From the village channel the cultivators arrange amongst themselves as regards the distribution of the water.

(c) Effect of years of favourable rainfall, the demand for irrigation and on irrigation revenue.—This is clearly exhibited in the following table, which gives the norea irrigated, minfall and receous for the past ten years. It is to be recollected that the rabi revenue is included in the following year to that in which the irrigation occurs:—

Test.	Kharii.	Rabi.	flot weather,	Total.	Ralofall,	Ap ess- ment or escence drinand,	Benarço,
1892-93	Acres. 274,839 280,528 258,301 261,485 316,941 299,061 304,778 805,464	Aores. 126,195 06,458 41,664 115,843 215,300 103,871 110,035	Acros. 9,727 10,700 17,109 18,304 22,825 31,013 25,993 26,331	Apres. 410,761 860,776 817,184 395,222 655,166 433,445 440,796	Inches. 87-69 46-62 59-65 58-46 80-59 63-59 63-74	Ra. 9,50,733 6,53,161 6,86,905 6,56,246 9,50,865 11,33,932 0,28,088 9,71,932	Below nverage, light in hathia.  Geod hathia.  Deficient in hathia.  Rains ceased early in Septembor.  Favourable. Fravourable, but none in hathia.  Deficient in transplanting season; no hathia min.
1900-1901 . 1901-1902 .	323,438 381,009	90,984 195,413	17,001 30,172	432,413 557,494	80·65 27·60	10,39,594 10,69,225	Heavy rain in hathia. No hathia rain.

Mr. J. H. Toogood. 25 Ost. 02. 25 Oct. 02.

Mr. J. H. The greatest fluctuations occur in the area of rabi Irrigated; the earlier the cresation of rains in September the larger the area irrigated.

9. Loans for improvements.—This information I have no means of ascertaining; it will no doubt be furnished by the Civil Department.

10. Programmes of relief works.

(a) Districts far which programmes have and have not been prepared.—Programmes of famine relief works have been prepared for all three districts of Patan, Gys and Shahabad; the statements have, I believe, been submitted to Government through the Commissioner of Patan, and they may be obtained and referred to for such information as is required by the Commission.

# APPENDIX A. Rainfall at Sassaram.

Year.	1	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nav.	Dec.	Jan.	Fab.	March.	Total.

No. 4114, dated the 17th October 1902.

From—The Superintending Eugineer, Sone Circle,
To—The Chief Engineer, Bengal, Public Works
Department.

With reference to your No. 380-T.I. of the 18th ultimo, forwarding a copy of the replies, dated 17th February 1902, by C. E. A. W. Oldham, Esq., Collector of Gya, to the questions set by the Irrigation Commission and asking for the opinion of the Executive Engineer, Eastern Sono Division, and myself on his replies regarding pains and askars, especially paragraph 20 thereof, I have the honour to submit copy of the Executive Engineer's opinion as set forth in his letter No. 4621 of the 3rd instant.

- forth in his letter No. 4621 of the 3rd instant.

  2. The paragraphs which deal with pains and ahars are paragraphs 12 et seq. In paragraphs 12 and 13 the system of pains and ahars irrigation in the Gya District has been very fully and accurately described by Mr. Oldham, and 1 have nothing to add. The system of pains and ahars irrigation is, owing to the physical features of the district, peculiar and essential to it, and enables the cultivation of rice, the staple food of the people, by supplementing the rainfall, which is inadequate for the purpose: their existence is, therefore, of great famine protective value. They are managed, as stated, by the people among themselves without courted from Government and are maintained by the landlords, ordinary repairs being carried out by the cultivators themselves.
- 3. In regard to these works, Mr. Oldham states that the two most important directions in which legislative action is at present necessary aro—
  - (a) the provision of a masonry head-work to control

    the lovel at the entrance and regulate the
    inflow;

(b) the enforcement of the upkeep of existing pains in bhack tracis.

It is specially in respect of these proposals that my opinion, I believe, is asked. As regards (a), I am quite in accord with Mr. Oldham. A regulator at the head should be insisted upon, otherwise the main channel and course of the river is liable to be diverted down the pain, which gradually deepens and enlarges; this is more especially the case when the pain is cut in the angular bend of the river in the direction of the current. There are several examples of the effect of this; the principal one that comes to my mind is that of the "Panchamn" river, south of the tawn of Hihar, in which some 100 years or so sgo two pains of 10 feet width were taken off; these are now 100 feet and 300 feet in breadth, and the main stream of the river passes into them, the result being that below them in the bend and beyond the river bed has silted up and the river pay finds its way into the old channel in the higher floods. The people along the old bed have thus been deprived of their supply and now have no redress. Other instances, which have been brought to my netice, and on which I have been consulted, are on the "Mohnr" river near Tikari on the "Phalgu" and "Sakri" rivers. I mm also of opinion that the erection of bunds in the river beds should be prohibited, as undoubtedly they deprive villages lower down to a supply lo which they are legitimately entitled. In fact, legislation should extend to prohibiting any interference with the main rivers and streams of districts without the sanction of Government. As regards (b), once the pain is made, and a proper regulator constructed under sanction of Government, their upkeep and the distribution of water chould, I consider, be left as new to the people to man-go amongst themselves: too much grandmetherly legislation is not desirable or good for any people. I do not think it would be possible for

Mr. J. H.

Togood,

Togood,

25 Oct. 02.

Togood,

tered all over the district. Generally speaking, the landlords and oaltivators well knew the value of water for
oggicultural purposes, and I do not think ore blind to
carrying out what is to their advantage and interests in
regard to the nukeep of theso pains and ahars. In the
case of bhaols tennres, if the crop dies, landlords and
tenants suffer aliko, and if the landlords are indifferent
and extortionnte in the long run, they will suffer by their
tenants leaving their holdings. As a rule, I believe
landlords find it to their interest to help their tenants and
rotein them in their villages. rotein them in their villages.

4. In cases where it is considered necessary, I am of opinion that it is desirable that landlords and coltivators should be encouraged to maintain and construct these pains and alars by advances an liberal terms. New works should, of course, he professionally approved, and sanction then accorded by the district officer, who would decide on the amount of assistance that should be rendered and the terms on which it would be given.

No. 4621, dated the 3rd October 1902.

From-The Executive Engineer, Eastern Sone Division.

-The Superintending Engineer, Sone Circle.

With reference to your demi-official letter, dated 26th September 1902, forwarding Bengal Government No. 380-T.I., dated 18th idem, with enclosures (herewith returned), for an approximation of my opinion, I have the honour to report as follows :-

Mr. Oldham's replies to questions 1 to 11.—Agres very closely with the opinion furwarded by me to the Collector of Gya with my No. 74-R., dated 20th January 1902.

of Gya with my No. 74-K., dated 20th January 1902.

With reference to paragraphs 12 to 19.—Mr. Oldham has a much more intimute knowledge of the working of pains than I possess, as my datics do not take me much into the areas virigated under this system. I quite agree with Mr. Oldham in the concluding paragraph of his replr to question 12, in which he points out the necessity for some provision being made under which Government could force the landlords to maintain the pains in good order, and in the event of their failing to do so Government chould have the power to do the work for them and recover the cost from the landlords. from the landlords.

It is, in my opinion, impossible to cannlise any of the rivers in the Gya District efficiently, as the supply depends entirely on local mintall and ne water can be obtained in years of seasty rainfall. This is so. J. H. T.

These head-works would not provent sand entering the pains.

J. H. T. the damage referred to by Mr. Oldham is canced almost entirely by the want of proper head-worke to pains. If the supply could be regulated so as to keep out water during high floods, the quantity of sand brought into the pains would be comparatively harmlers. As, herevor, mone of the rivers in the Gyn District, with the exception of the Ponpun, have any direct outful into the Ganges, all the sand brought down by these rivers must eventually find its way on to the fields and all the sand kept out of pains in the opper reaches must be doposited semewhere lowar down.

1. Q. (The President.)—How long have you been Su-perintending Engineer of the Sone Circle?—Five years. 2. Q. And, as I know, you have hed long experience hero hefore.—Yes, as Assistant Eugineer and Executive Engi-

3. Q. We have had ample evidence that the irrigation here

is extremely popular, as popular as I have seen anywhere.

4. Q. I understand that the whole supply that you can count upon in the hathia is employed.—Certainly.

5. Q. In evary year?—Not overy year. In 1899 the sapply of water fell below, and if we had had to supply water to a larger area, we should not have been able to do so.

- 6. Q. The hathia is a period of about 15 days?—Yes, generally from the 26th of September to the 10th of October.
- 7. Q. Could you in a year, when the supply failed, say to the raiyats—" We cannot give it to you in 15 days, but we can give it to you in 22 days "?—That was what practically happened in 1899.
- 8. Q. Were they much worse off?-I don't think they

Paragraph 20.—I quite agree with Mr. Oldham in his remarks on the ovils of the bhaols system, but I am decidedly of opinion that it would not benefit the tenants

decidedly of opinion that it would not benefit the tenants for Government to take over the entire control and management in the pains. These channels are so namerous and the country so difficult to get about in that their management would necessitate a very large namber of subordinate officials with the attendant evils. A very large increase in supervising officers would also be required to keep a check on the subordinates. On the whole, the fax on the tenant would really be heavier than it is now. Under the present system the interests of landlord and tenant are really identical, and if the landlord could be brought to see this, the division of the crop being brought under control, the present system would, I think, he the most suitable for the district.

I quite agree with Mr. Oldham in considering that it is very necessary that proper head-works should be constructed for all pains and that the maintenance of pains in proper order should be enforced. The question of the prevention of bunds across the rivers is a mora difficult one. The supply of water in all the rivers in years of scanty rainfall is not sufficient for all, and the need of water is a worse that it would remain an armed force to reserve is so great that it would require an armed force to prevent the cultivators making a bund ocross a river when they saw their own crops dying and water going past which could save them.

In October 1899-1900 when the supply in the Sane failed it was found necessary to employ a comparatively large police force to prevent the banks of the Patin Casal and its distributaries heing cut. The difficulty would be very much increased in the case of pains which are scattered all over the district and are in many cases difficult of necess.

over the district and are in many cases difficult of necess.

I have already stated that I do not consider that canalisation of any of the Gya rivers is desirable; the Puapun is in some respects an exception. It is a perennisl stress with well defined banks and carries a fair discharge even in year of drought. At present bunds are made at various points in its course both in Gys and Patna Districts, and when the rains fail a large area is irrigated from it. It would be possible and perhaps desirable to regulate these bunds and in some places feed canals, almostry were and perhaps desirable to regulate these bunds and in some places feed canals. Masonry were and permanent head-works would be carried out and worker required, as the cost of temporary

The river is very wide and aballow, and I do not think the scheme soggested could be carried out and worked except at a prohibility cost. J. H. T.

required, as the cost of temporary bunds is high and they cannot be made until the river falls very

Paragraphs 21 and 22.- I ogree in general with Mr. Oldham's remarks.

D.-TANES. Paragraph 23.—The construction and maintenance of ahars is, in my opinion, best left as it is. The landlords and caltivators understand the principles under which they can be worked satisfactorily. By

l quite agree. these means a large quantity of water is stored for future use, and J. H. T. given good rain in Angust and at the end of September, the erop dependent on them is assured. The lands on which ahars are used could not easily be irrigated in any other

way.

Paragraphs 24 to 33.-I agree with Mr. Oldham's opinion.

- 9. Q. Did they ory out for remissions? Did you grant them remissions !-No. We gave remissions where the crop fell below a certain avorage.
- 10. Q. During the whole season there are periods when there is more water than is actually wanted, even the hathic?—There are periods in which we have more water than is required.
- 11. Q. Would it he worth while to take measures for increasing the supply of the cannis for that time?—I am efraid the expense would be probibitive.
- 12. Q. I should like to know whether you could ant down the walls of your weirs so as to erents greater velocity?—
  It would cost a certain amount of money, but it might ha worth it. It might damage navigation, but that would be immuterial.
- 13. Q. Is it n thing that has come before you?-I have thought of it.
- 14. Q. I understand that the extreme pressare at the time of the hathia is due to the draining off of the whole rice-fields just before ?—Yes.

- 15. Q. Cauld you to any advantage arrange to fill ahars just before, sey, in the first week of September ?—We could fill the ahars, but it would affect the irrigation. I fancy if we went in for that system the leases would decrease. I dou't see how you could quite make an essessment.
  - 16. Q. (Mr. Muir-Mackenzie.)—Is there not enough water to supply the leaves and to fill the ahars as well f-There weald be at times.
- 17. Q. (The President.)—Could one use the ahars as supplementary storage busins ?—Of course where the whole block or all the lands below the ahars were under leases there would be no harm in filling the ahars when we are -spilling wutor.
- 18. In September you are spilling water ?-Generally no ure.
- 19. Q. You think the difficulty would be about assessment?—Yes. Some of these ahars are connected one with another, and they would probably pass on the water to unleased lands.
- 20. Q. Is there inside the field of irrigation a considerable amount of water supplied to louds which do not pay any canal rates!—There is. We try to prevent the ahars being filled from the canals except at certain times when water is given at fixed rates, but there is always u lot of malpractices in the way of water being taken into unleased lands.
- 21. Q. If these malpractices mean wastage of water, they are malpractices. If they mean merely a question of dithently of usessment, would not you wish to got rid of that difficulty somehow? For instance, could not the difficulty he got over so as to store and utilize water, the ahars being used as reservoirs?—If all the lands were leased, of course there would be no objection whatever; but of course there would be no objection whatever; but of course there was a supplied that a supplied the ahars.
- 22. Q. (Mr. Rajaratna Mudaliar.)-Might the akars be filled by arranging for lump payments from the zamindars?—You would have to select your alars for that purpose. You might do it that way. It is possible.
- 29. Q. (The President.)-You say the sugaroane oultivation has been doubled since the construction of the Sone Canals: Its area is limited to the hot weather supply ?—Yes.
- 24. Q. You mean the supply before the mins?—dust before the rains. The hot weather season ends with the 25th of June.
- 26. Q. What are you irrigating besides sugarcane then? -Sugarcane is the principal crop; there is a little indige also.
- 26. Q. Do you practically take every drop of unter you can for sugarcane?—We are often very lard pressed indeed for the sugarcane. In fact, the custern main system has often to be closed owing to dearth of water in the hot weather, i.e., from the 20th of April; the water we let
- 27. Q. We found eleewhere a very considerable system of supplementing canal irrigation and tank irrigation by wells?—You see here the staple food of the district is rice and that rannot be irrigated by wells,
- 28. Q. I mean for crops like sugarcane?—Thor do irrigate a little sugarcane in places from wells; in the Blubon Sub-division I have seen a large plot of sugercane irriguted from a well.
- 29. Q. They would not think of helping ental irrigation by irrigation wells ?- I don't think so.
- 30. Q. What is your hot weather supply ?—It goes down to about 600 or 700 oneces.
- 31. Q. There has been no question of storage in the valley of the Sone, hus there P—No; I don't think there is any project, unless you take these smaller irrigation streams in Chota Nagpar. They are on the tributaries of the Sone.
- 32. Q. I suppose you have not much occasion to go into Bhubuu f.—I have to visit Bhabuu; I mean just going by rull-way to Bhubua, but I have not travelled about much within the Bhabus Sab-division.
- 33. Q. You were here before the irrigation by the Sone Canals began. Is Bhabua very much in the same state as this part was before it came under irrigation?—I think Bhabua is very much worse than the Shahabad tracts were
- 34. Q. (Mr. Muir-Mackensic.) What did these depend on then ? Ahars principally.

- 35. Q. Shehehad is very much like Gyn?—Totally different. It is a flatter country. Gyn is an undulcting country. It (Gyn) is like parts of Mudras.
- sidered, and here we are met by the difficulty that the Kanamaussa traverses the western and northern portions of Kalammess traverses the western and northern portions of the district concerned, so that the bulk of the storage is unsuitably placed for corresponce to the affected tracts. He also goes on to say:—"The only solution to the difficulty oppears to be to construct a high-level canel, taking off from n weir, to be constructed as close as practicable to the point where the Karammassa emerges from the hills (soy, at about the level of the 270' or 280' content) and running nearly due cast for about 36 miles, falling gradually to about the 250' content at the point where it would meet the Kudra river." Could you not take u canel from the bettom of it b—Those recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the least of the storage recognizes are the storage recognized and the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are the storage recognized are bottom of it?—Those reservoirs are too high up the river for a canal to be taken direct from them. The reservoirs are wery high, and there is a water-fall of 175 feet below their proposed sites.
- 37. Q. Then the river itself would be made to carry ater?—The reservoirs would held the water and the river would be used to carry it to a weir lower down.
- 38. Q. I suppose you think it would be the right thing to thrash out time Karamunasa project and have it properly surveyed?—Most decidedly.
- 39. Q. Have you means in the way of officers for undertaking it?—I have not. It certainly requires a special man and a good man.
- 40. Q. Has the Province got the means?-Mr. Horn would be able to state that.
  - 41. Mr. Morn-I think we could get it done.
- 42 Q. (The President.)-You heard Mr. Rajaratuu's examination just now. Can you give us information as to what the cost per acro is for the beasurements?—It has all been most carefully worked ont in this book. It comes to about 5½ annas per acre. I think the Deputy Collector's establishment costs between Rs. 60,000 and Rs. 70,000 in year. The cost of measurement and collection are nearly equal—helween 7 and 8 per cent each. At present the cost of measurement and collection are nearly half-and-half.
- 43. Q. That is, 15 per cent, both for measurement and coil ction ?-About tlint.
- 11. Q Are you satisfied with the way that the contract system works ?—I am quite satisfied : it is very good.
- 45. Q. It does not lend to any waste of water : want of economy of water ?-It is minimised.
- 46. Q. Do you look after the village channels?-Yes, they are under us. They are paid for hy the villagers and ramindars, but they are under our supervision, and we can entorce their repairs under section 60 of the Canals Act.
- 47. Q Are you satisfied that the period of loven years is a saitable one for leases?—I think it is about the limit it
- 48. Q. You think it shoold not be longer !- I certainly don't think it should be longer. People die, and you find many changes in seven years.
- 49. Q. Have you any suggestions which you would like to bring before the Commission as regards the points before it?—I don't think so. I don't think there is anything.
- 50. Q. Have you found here my demand for drainuge accompanying irrigation !- That was so some years ago, just after the irrigation commoneed on the Sone Canals and a large number of drainages were carried out.
  - 51. Q. You have a number of drainago channels ?- Yes.
- 52. Q. (Sir Thomas Higham.)—As regards these questions of measurement, I understand you have very little measurement to do in the Sone Canals ?—A great deal of measurement has to be done. Blocks have to be measured when you give u leaso.
- 53. Q. After you have given the lease you don't menfield have taken water and which have not f-No. Wo nesume all has been watered. A mun is liable whether he takes or does not take the nater.
- 54. Q. What is the use of your measurement staff?—We have to rotain a certain number, because in one year a cortain number of leases lapso.
- 65. Q. Your measurements are not only on the applications for long leases, but subsequently for the rabi oud peronnial crops !- Yes.

Mr. J. H. Toogood,

Mr. J. H. Toogood. 25 Oct. 02.

- 56. Q. Thr. Muir-Mackenzie.)—Also far the scaen leases?—They are generally measured up about the time the applications are made; sometimes before, sometimes after. We try to measure them up before we grant the leases. The kharif eason leases are in blocks.
- 57. Q. Could you tell us something about these blocks; what are the sizes of these blocks?—They vary very much. We have some 40 bighas or 25 acres. That is the smallest block. The rule is nothing less than 50 acres is leased. Some villages have 800 ar 900 or 1,000 acres, perhaps more.
- 58. Q. I suppose you never have a block divided between two villages ?—Sometimes we add a small area in one village to a larger block in another.
  - 59. Q. For convenience ?-Yes.
  - 60. Q. As a rule, the block is village by village !-Yes.
- 61. Q. But you may have more than one block in a village?—Yes. We have more than one block; sometimes two at three blocks. However, I am trying to get them, so that all the lenses expire simultaneously.
- 62. Q. Snpposing some of the owners in those blooks do not want water. What happens?—If they do not all agree, that is to say, if a very small percentage is left aut, we give in and grant a lease. But it must be a very small percentage. We generally wait till they all agree.
- 63. Q. If they do not all agree, you do not give a lease?— Wo do not unless there are a very few left aut, and if there are a few, we try and catch them. We keep a watch on those who are left out. They have our special regard.
- 64. Q. That means an establishment?—Yes. Patrols go round to laok after them.
- 65. Q. Then what do you do in regard to remissions?

  -No remissions can be granted an long lease lands, except specially under the Superintending Eugineer's orders.
- 66. Q. On what greeneds does he grant that?—If the field has been left unonltivated, he might grant it, or if the man has bolted.
- 67. Q. If the water has been available and the man does not take it, do you grant him remission?—Very mrely. I thick in the last three years about Rs. 13 has been granted.
- 68. Q. Have you no claims for remission on the ground that the enpply was not sufficient ar regular enough?—We have had no such complaints.
  - 69. Q. You nover give remissions on that ground ?—No.
- 70. Q. You never have nuplications for remission an account of irregular emply ?—Wo may have had, but there have been very few complaints.
- 71. Q. Then practically yan give no ramissions?—None an the long leases.
- 73. Q. (Mr. Mair-Mackenzie.)—But yan do on tho season leases?—Yes, we do on season leases, but not on kharif season leases.
- 73. Q. (Sir Thomas Higham.)—Season leases are not entitled to water until lang leases have and theirs?—Generally we look after the supply to the long leases first.
  - 74. Q. A long lease has a preferential claim?—Yes.
- 75. Q. Therefore season leases might have a short supply?—Well, I don't recollect any cases.
- 76. Q. If there was a short supply, would you give remissions ?—We don't give remissions generally in block area, and the season kharif leases are block areas.
  - 77. Q. In rabi yan give remissions?-Yes.
  - 78. Q. And perennial?-Yes.
- 79. Q. Oo account of short enpply?-It is generally failure of crop.
- 80. Q. From whatever causes?—It is generally not due to our short supply.
- 81. Q. Supposing crops were eaten up by locnets, would you give remissions for that ?— We have done so.
- 82. Q. You don't make a regular practice of it ?-No.
- · 83. Q. What is the eystem of rotation in giving water? Is it given continuously to the people?—For ten days they get water constentively, and then for five days they are shut off, and so on.
- 81. Q. That is the practice?—On the Patna side they have 12 and 4 days respectively. We shall probably reduce that to 10 and 5 days respectively. Ten and 5 days is the general system.
- 95. Q. (The President.)—What percentage of the lands pre watered as n rule?—No. Fifty per cent. is what we

- limit correlves to a certain extent, but we do go up to 80 or 90 per cout. in a small village.
- S6. Q. Theoretically you irrigate about 50 per cenf. F-Yes, so us to distribute the benefits of the water more evenly throughout.
- 87. Q. (Sir Thomas Higham.)—Then I understand your capsoity is limited by what you can do in the first 15 days at October?—Yes, they must have water for the rice crop during that period.
- 88. Q. Both the late rice and the early rice?—Not the early rice. For the early rice they don't want the water; for the late rice they want it.
- 89. Q. In Maconchy's book he says that the duties are based on the total kharif nrea, not an the late rice area P-Yes, but the area of early rice is a very small proportion.
- 90. Q. The only time you have really fallon short in the hathia was in 1890?—Yes, in October 1899.
- 91. Q. What is the maximum supply of the canals?—4,500 ousces in the main western system and 1,850 cusecs in the main eastern system.
- 92. Q. What did you do in 1899?—I distributed the supply between the three main branches.
- 93. Q. The three main branches are?—The Patna, Arrah and Buxar. The water was distributed between them according to area leased.
- 91. Q. Now you are refusing leases on accenat of the experionre of that year?—To a certain extent we are refusing leases on account of the limited expectly of our canals. The capacity of our canals is only 6,350 ousces.
- 95. Q. In 1899 yon say you refused applications for 40,000 nores?—Yes. That is, where it was beyond our kharif limit, we could not extend the water there. Our canals only carry 6,350 casees.
- 96. Q. That is because you have not got the water f-
- 97. Q. The irrigation for large areas has naturally to be reduced when there is a want of water? -Yos, and we have not got the water. We cannot carry more than 6,350 casess. If you take 6,350 cubic fest and multiply it by 60, that gives ubout 360,000 acres.
- 98. Q. You can novor do wore than 360,000 in the kharif area?—I don't think so, unless we increase our carrying capacity, and we must also consider the water wanted in the hathia.
- 99. Q. You are limited by the water wanted in the hathia!—Yes; by the amount of water we can give during the hathia.
- 100. Q. What do you call the hathia, 15 days in October?—Fifteen days. It is a lunar asterism.
- 101. Q. Csnnot it be strotched?—I have already said I think it can. I think in 1899 we practically did stretch it. It is the only year we probably did stretch it, but I think it affected the crop. I told the people distinctly that year when they came and crowded round my compound—"If you use the water carefully, you will get a very fair crop; you will not get a full 16-anna crop, but you will get 14-anna.

(ن)

- 102. Q. You did not give many remissions?—No. We gave certain remissions, if they had a very had erop.
- 103. Q. When leases fall, are they invoriably renowed or is there any difficulty in doing so f—The people are always eager to renow them. They never let them drop, not if they can balpit. We generally refuse those who will not comply with our conditions of making proper boundaries, improving their village channels, etc.
- 104. Q. Thon if you have got so many applications, I suppose you have a strong hand?—Yes, we have. The rayats are very loth to lose a lease.
- 105. Q. The area that lapsed this year was 36,000?—Yes, nod the total area applied for was 141,000.
- 106. Q. Have youn perfectly free hand in refusing ar renewing a leave?—Yes.
- 107. Q. If a man has had a lease for soven years, could you say "we won't give it to you?"—If he does not comply with our conditions. Now water is so valuable here, people are eager to get it, and if they don't comply with the conditions, we do refuse them.
- 103. Q. Bat if they comply with the conditions, you don't refuse?—Wo never refuse.
  - 109. Q. Havo they any rights !- I don't think so.

- 110. Q. You do refuso them now and agoin?-Yes, we have refused them.
  - 111. Q. When were the mtcs last rovised P—The former rates expired in 1895-96 and were then revised.
    - 112. Q. Were they raised then?-Yes.
  - 113. Q. Is there any legal objection to their being mised at any time?—None whatever,
- 114. Q. Thon it is a matter of supply and demand?—ust so. It is a matter of supply and demand; and also the benefits that the cultivators get from irrigation ; I mean .tho extra produce they get.
- 115. Q. Supposing you said that instead of charging Re. 2-8 for the long system leases, you would charge Rs. 3, there is nothing to provent your doing that?—No. I think there is every reason for us to do so.
  - 116. Q. It is now seven years since the rates were last wired ? To when does the present rate extend?—Up to March 190 i.
- 117. Q. Is there any question of raising them then ?--
- 118. Q. (Mr. ) fuir-Mackenzie.)—You cannot raise the rates in the middle of the lease  $^p$ —No.
- 119. Q. (Sir Thomas Higham.)-How far does Government deliver water? Does it deliver it into each block?-Government delivers water up to each block. We attrying to get the channell extended well into the blocks.
- 12). Q. The Government channels ?-We have no Government channels; they are all private channels.
- 121. Q. You have distributaries !- Yes, and they are Government channels.
- 122. Q. Do these distributaries go into the villages ?-No.
- 133. Q. Is water brought into the edge of overy village?
- 131. Q. And the village channels may have to pass through another village?—Very often, and no have to against the laud for these channels. Generally the people gire the lands where the channel is in their own village. They can arrange this aroong themselves; if unt, we nequire the land under the Act. the land under the Act.
- 125. Q. Do you pay for the land?—Yes. The applicant for the village channel has to deposit the mency in the Executive Engineer's office before any preliminary oction is
- 126. Q. Do you buy the landf-Yes. We take up the land under the Land Acquisition Act.
- 127. Q. Is there may objection ?— Yes, they always want the channel to go another way. They always want to save their own lands and put it in their neighbours.
- 138. Q. What is the length of those water-courses?-We limit them to 2 miles.
- 129. Q. What do you mean?—We don't allow them to go more than 2 miles from the distributaries.
- 130. Q. If they want to go further, do you make another distributory P—As we have not get the water, I:throw out thuse applications, because lots of our distributaries run dry duting the kharif seasou.
- 131. Q. Does much waste go on in these water-courses?
  —There is not much waste, but there is a certain amount of waste, because some of the older channels are not in excellent order, and then again every year channels are damaged, because each man gives the channel a out with his kodati and gradually the channels get into had order, so that it is necessary after the seven years to be more particular that the channels should be brought into repair.
- 132. Q. Before you renew your leases you enu insist on the repairs !- Yes, that is one of the points that I insist upon. I am very particular about that.
- 133. Q. (Mr. Muir-Mackenzic.)-With the irrigation 183. Q. (Mr. Mair-Mackensic.)—With the irrigation so repular and the demand for water so keen, why is it that the anticipations as to the revenue likely to be realised on the Sone Conals have been disappointing? Is it because the canal has not carried as much water as you expected?—Well, first of all, the duty is much sundler than was expected, and then again the navigation has not come up to auticipations. Another reusen is that the anticipations were made upon the large rabis cultivation which has not corneral. which has not occurred.
- 184. Q. You don't think you could increase the rabi oultiration by lowering the rates temperarily? - I would mise the rate, because what has happened is exclusion of the rabi lands within the long leased blocks. They have all,

- as far as possible, been converted into rice lands, and there is no rabi exclusively sown on them.

  The agents of the converted into rice lands, and there is no rabi exclusively sown on them.
- 135. Q. Still I don't understand why you would raise the rabi mtes?—There is generally enough moisture in these lands in ordinary years, so they are not leased except in
- 136. Q. You don't think, if you lowered the rabi rates, they would be inclined to take water?—I doubt whether the leased area of rabi would increase.
- 137. Q. Do you find that the value of land has increased very much ?—From all I hear rents have very consideraby inercased.
- 138. Q. You know instances where rentals have considerably increased?—There is a very interesting paper on that subject by Mr. Lusen. I have it here.
- 139. Q. At any rate it is your belief that the value of land has very largely increased. Rentals have also increased, have they not?—Yes.
- 140. Q. Even where the system of rentals is cash?-Yes, even in the eash rentals.
- 141. Q. Do you know how the laudlerd manages that in opice of the Tennucy Act?—I have heard laudlerds express the view that they can drive a carriage and pair through the Tenancy Act.
- 142. Q. (Mr. Rajaratna Mudaliar.)-Even in the case of occupancy tonants ?- I believe so.
- 143. Q. (Mr. Muir-Mackenzie.)—The tenants find it hest to keep on good terms with their landlords?—Yes. There is a sort of mutual self-help society between the landlords and tenants. There is no doubt landlords do a great deal of good in times when the raigats are in want.
- 144. Q. You don't think that when the landlords' slurce have been increased in value that it would be advisable to take an owner's rate from the landlords ?—There would be very great objections to it on the part of the imidlords. That ought to have been done in the first instence. I don't think it would be advisable to attempt it univ.
- 145. Q. Recause of the objections that would be raised? -Yis, although it would be quite justifiable to do so.
- 146. Q. (Mr. Rajaratna Mudaliar.)—You said that Shahabad was chiefly dependent on ahars before the cauel was constructed?—Yes.
- 147. Q. Did the construction of the canal interfere with the old sources of irrigation?—No. They got the same drainage water into them as before, except perhaps from that little strip occupied by the canal.
- 148. Q. Are there no cases in which the canal interfored?—There may be end or two cases; I don't recollect any. I daresay there might have been where the canal took up an ahar itself. I think you will see that in Mr. Luson's note also.
- 149. Q. (The President.)-A note prepared for the Government?-Yes.
- 150. Q. (Mr. Rajaratna Mudaliar.)—In such cases you supplied the water displaced by the canal?—I think in most of them. The lands alongside the canal are nearly all leased.
- 151. Q. Where the old sources were interfered with, what do you do to compensate the zamindar? Do you samply water to the old irrigated lands?—Of course we do. As I eny, we are supplying it to those villages alongside the canal which we interfered with.
- 152. Q. You supply water free th such lands ?- Cortainly not free.
- 153. Q. I find from some papers that water is supplied free from the Madhubani Canal ?—Yes. That was construgted by a zamindar, and then afterwards bought.
  - 164. Q. Is that in your jurisdiction?-It used to be.
- 155. Q. Why is water supplied free theref-You had better read the papers in the case; it is not in my jurisdiction
- 158. Q. Do you see any objection to the wark of measurement and collection being done by one and the same staff? —I think one is a check upon the other. It would be most underirable to have both done by the same staff. It is now dono independently by the two parties, and one is a olicok upon the other.
- 157. Q. Could may saving be effected if the work were dous by one and the same staff?—It could be done, but there will be no saving of staff. At present you might say the one is a sort of check upon the other. If the same

Toogood.

Mr. J. H. man measures and makes out bills, the whole thing is in Toogood. his hoads and there can be no check over him.

25 Oct. 02.

- 168. Q. (Mr. Muir-Mackenzie.)—I want to ask you once again about the rabi oreo. Would not the cultivator, who now hesitates to take woter, readily take it if the naterrates were luwered, say, in o season of good rainfall?—I do not think it would be a good thing to have a varying rate for the good and bad seasons. I think the rates are quite for the good and bad seasons. I think the rates are quite low enough now. I hove recommended an increase of the
- 159. Q. What is it here?—Here the rate is Rs. 2 an acre for rabi.
- 169. Q. Another thing I wanted to ask you about was with reference to compliance with a larger number of applications for losses. I understand that the number of applications complied with is limited to the amount of water supplied during the hathia?—Yes.
- 161. Q. Do you think it would not pay hetter to risk the supply running short in the hathle and grant remissions for failure of crop or for injury done, and to comply with the larger number of opplications?—There would be enormous difficulty.
- 163. Q. This rarely happens f.—I do not say it rarely happens. It happened in 1890, and though I do not say it will happen in this year, it may. The river is beginning to
- 163. Q. (The President.)—You have passed the hathia, have you not?—Yes.
- 164. Q. (Mr. Mair-Mackensie.)—Then in 1899 you have told us that the cultivators did contrive to husband the water, and saved a gnod deal of their erop; they got their 14-nnna and did not apply for remission f—Yes.
- 165. Q. Even if you had granted o few more explications it would have been consistent with giving a full supply through the hathia?—Yes, but the people would not welcome that system. A rayat would rather have his crop than his remission.

106. Q. Yondo not think it would be worth while to run a cartain risk?—No, I do not think so. We might get up to \$60,000 or 400,000, but I doubt if we will go beyond

167. Q. (The President.)—Can you give me any idea how much the capital account of the cannis less increased by the splendid provision made for unvigation ?—I saypose about 50 lakks on about 275 lakks.

168. Q. That is about 20 per cent. ?—Yes. The navigation works were very expensive and their maintenance is very expensive now.

169. Q. Did the navigation ever fulfil at all what was hoped it would before the railway came into these parts?—Never hefore the railway. Doring the railway construction we got up to the amount stated by Colonel Dickens by carrying their materials. We never had a large amount of traffic except when the railway was being made.

170. Q. Is it oppreciated as n boon ?—I think the people appreciate the steamer corvice on the canals. It is still going on.

171. Q. Was it at all in the district appreciated as a thing worth making a sacrifice for ?—I think so. The steamers appear to run full. The geutleman who has bought the steamers and has hired them is reported to he a wealthy

172. Q Has it done much good in the country os regards country boats? I think it has done some good, but it has often to be sacrificed to the interest of intigution. There is sometimes unt enough water for both.

173. Q. It is killed now? - Well, I nm told that the steamer traffic is killing the boats altogether, because the firm have reduced their rates.

174 Q I did not know there were ony steamers on the cands?—Two steamers.

175. Q. Don't they cut up the banks !- I don't think

WIRKES No. 17 .- Ma. W. S. BREMNER, Executive Engineer, Eastern Sone Division.

(Replies to printed questions.)

A.

1. The Buxar and part of Sasteram Sub-divisions in Shahabad and the portion of Gya and Patan Districts situated between the Poon Poon and Some Rivers. Mr. W. S. Bremner.

25 Oct. 02.

I have been for four years Sub-divisional Canol Officer at Sikronl in Buxar Division and for three years in charge of the Eastern Sone Division of the Sone Canals.

2. See statement.

- 7. (1) It is possible to grow a second (paira) erap on almost all rice lands with the help of canal water. This can only be done in exceptional cases. The actual cash increase in value is about its. 8 per acre In addition to this, the pulse crop has a beneficial effect in introdocing nitrogon into the soil.
- (2) The use of canal water permits the substitution of rice for rabi crop to a considerable extent where water is available. During the hot wenther a much larger area of sugarcane can be grown than would be possible without it.
- (3) (a) In a year of ample rainfoll the use of canal water only increases the yield of rice crops, and that not to any very great extent. On average land, however, even in a year of emple rainfall, canal water is useful in enabling the caltivators to plant the seeds, transplant, and drain his lands at the right time. The draining of rice-fields in the utranichatra (middle of September) is of great benefit to the crop.

In a year of ample minfoll the neo of canal water increases the yield on rice hods by abent 10 per cent.

(b) In a year of scanty rainfull canal water is almost indispensable. Without it the orop suffers badly of each break in the rain, and agricultural operations cannot be carried on at the right time. The use of canal water in such a year increases the outturn of rice hande about 30 per cent, on the average. per cent. on the average.

(o) In a year of drought const water is indispensile; no ries can be grown without it, and rabi crop cannot be sown on about 50 per cent. of the area.

In a year of dronght canel water increases the yield of rice lands about 200 per cent., that is, a normal crop can be obtained instead of 30 to 40 per cent. of the normal. On

rati lands the increase is about 100 per cent., as without it the crop can only be sown on half the area.

8. (1) On lands under loog term leases, Rs. 12 per nero. On lands under season leases, Rs. 22 per nero.
(2) On londs under long term leases, Rs. 30 per nere.
On lands under season leases, Rs. 20 per nere.

9. (1) Re. 3 per sere on the average. This is paid on the area irrigated except for long term and kharif leases, in which case it is poid on the area entitled to a

(3) All.
10. The construction of village and field channels. 10. The construction of village and held channels. The village chonnels are made by the laudlord in case of bhaoli land, that is, where the crop is divided. Where rent is paid in eash, village channels are, as a rule, made by the cultivators unless the landlord has a direct interest in the irrigation. Field channels are made by the cultivators. Wherever actual cash expenditure is neutred, the work is done by the landlord. If expenditure is incurred by individual cultivators on construction of village channels, rent for the yea of the channel can be recovered under the Rangal Irrigation Act, provided the person who great the

Bengal Irrigation Act, provided the person who spent the money is registered as owner of the channel.

11. None in the districts of Shahabad, Patan and Gyn with which I om equainted. The slope of the country is fairly steep, shout 2 feet per mile, and the water flows off freely if not obstructed.

Statement showing the average rainfall, month by month, for the year 1901-1902.

- 1: Q. (The President.)—You are Executive Engineer of the Eastern Soue Ceaals?—Yes.
  - 2. Q. How long have you been here?—Four years in April next.
  - 3. Q. Where were you before?—One year in Orissa; before that five years in Shahabad.
  - 4. Q. Then you know the country well in these parts?
  - 5. Q. Is there any value attaching to the silt carried down by the Souc river?—Cultivators attach great value to it.
- G. Q. In all seasons of the year?—It only comes during the kharif season.
  - 7. Q. It has alluvial matter in it?—Yes; it improves the fields close to the eatlets very much.
  - 8. Q. You have submitted a paper upon the Gya pains and ahars. These Gya works have not come under you?—No; a great part of the district is in my jurisdiction; however, I have the Grand Truuk Road through the Gya Dietrict; also civil huildings.
  - 9. Q. Do you consider there sheald be provision of masonry head-works on pains?—Yes, that is very important.
    - 10. Q. Who should pay?-The laudlerds.
  - 11. Q. Would they pay do you think, or would they consider it u hardship?—I don't think they would consider it u hardship to pay. A great many of their pains owing to the absence of head-works have become too wide, and damage is done which they are trying to remedy, but cannot do so.
  - 12. Q. Is there any sort of maintenance establishment P Are there patrols P—No, the Tahsildar with the cultivators manage them.
  - 13. Q. Have you seen anything of the disputes among zamindars?—I have never been personally in any of the disputes; several of them have come to my knowledge when travelling about the country.
  - 14. Q. Would you recommend putting pains and chars under professional charge?—I think some Public Works officer should be required to inspect them once a year when the time came for repaire and to propose rough estimates of what should be done; this should be sent through the Collector. If work was not started within a reasonable time, Government should take it up.
  - 15. Q. You consider that the Executive Engineer should have the responsibility?—In most cases it would only be a line of levels and an estimate.
  - 16. Q. De you consider it should be put under a Public Works officer, or should there be special district provision for it?—A special officer, I think; not a man in the position of Executive Englueer.
  - 17. Q. You say in your memorandam "the question of the provention of bunds across the rivers is a more difficult one. The supply of water in all the rivers in years of senaty rainfall is not safficient for all and the need of water is so great that it would require an armed force to prevent the cultivators making a bund across a river when they saw their own crops dying and water going past which could save them." That requires very claberate arrangements; you would have to see not only that there was a taw, but that the law was carried out?—That would require a great deal of care no doubt; most pains want work without u bund when the river is low.
  - 18. Q. I gather you would not interfere with ahars; you say in your note "the construction and maintenance of ahars is, in my opinion, hest left as it is. The landlerds and cultivators understand the principles under which they can be worked estisfactorily. By these means a large quantity of water is stored for fature use, and given good rain in August and at the cad of September the crop dependent on them is assured "?—That refers to the Gya District where the thing is managed very well. They want masonry outlets.
  - 19. Q. I suppose there are a great many of these ahars?—Yes; as a rule, a few outlots would brigate the area commanded.
  - 26. Q. Havo you any acquaintance with the Bhabua Sub-division ?—No; my inrisdiction extended to the Buxur Caual.
- 21. Q. You know nothing about the Karamnassa project ?—No, except what I have seen looking through the papers.

- 22. Q. Have you any suggestions for increasing the supply of the canals? Is there any means of doing it? —Oa this side of the river we still have room for improvement, but not on the other.
- 23. Q. You are not tight for water ?—As a rule, there are only 200 cubic feet spare, for which leases have not been given. The people are inclined to be somewhat lazy and won't do whet we tell them.
- 24 Q. (Sir Thomas Higham.)—You say it is possible to grow a second crap of rice with the help of canal water. Is that second crap that you refer to charged as a separate crop?—No.
- 25. Q. If a field has been watered for a rice crop and then rabi is grown, don't you charge for it?—Wo charge for the rabi if he has to plough his land and then sows agaia, if water is taken after the rice is cot.
- 20. Q Can you always tell when that is?—Yes, by the nature of the crop, hat if it is a paira crop, then no charge is made.
- 27. Q. Are measurements made by your own mea ?—The patrol does it first.
- 28. Q. You say in a year of rainfall the use of canal water increases the yield 10 per cent. How do you arrive at that figure; is it based on anything ?—Yes, it is arrived at by a comparison of similar figures in a year of ample rainfall and by experiments made every year in the fields.
- 29. Q. Do you weigh the ontturn?—We take the whole of one plot, say, one-eighth of an acre, have it thrashed out in our presence and weighed.
- SO. Q. Is 10 per cent. generally accepted as a fair statement of the increase dae to irrigation?—I think so.
- 31. Q. How much does that mean ?-Two maunds an acre.
- Q. (Mr. Allen.)—Two manuals of paddy or rice?— Two manuals of paddy.
- 33. Q. (Sir Thomas Higham.)—With regard to what you say in paragraph 8 (1), I don't understand how the term of the lease affects the produce?—Long term leases have the advantage that they are sure of the water and get it at once.
- 84. Q. With regard to what you say in paragraph 9 (1) as to the rate being Rs. 3 per acro on the average, is that not above the notual rate?—I take two-thirds of the area at Rs. 2.8; the rabi area is very small and sugarcane is Rs. 5 an acre.
- 35. Q. You don't answer the question whether the oultivator pays anything to the owner of the land on enhancement of reat?—I am not fully acquainted with the subject.
- 33. Q. You don't know whether he does !—I know the landlords are always trying to raise it, but they have difficulty in doing so.
- 37. Q. How does he do it?—One way is that in bhaoli they will not agree to convert into maked; notes the man pays a very high rent. If the village is naked; and improvements are required, he will not assist the caltivator if he can help it naless a higher rate is paid.
- 38. Q. Do the landlorde pay part of the water-rate?—In bhacli they settle it with cultivators. On this side of the river they help the cultivator.
- 89. Q. When you get these applications for big blocks, do they water every acre in that block every year f—Yes.
- 40. Q. Have you not such things as fallows?-No. They usually have two years paddy and the third year engarcane.
- 41. Q. Do you over all up any ahars outside the blocks f-No, because they won't buy the full quantity of water.
- 42. Q. What is the rate for selling water?—Re. 1 per cubic foot per second for 21 hours.
- 43. Q. Do they ask for water to ahars on payment?—Very seldom.
- 44. Q. Supposing there is water going, do they never ask you to fill up their tanks?—We fill their eattle tanks free, but not ahars.
- 45. Q. (Mr. Muir-Muckenzie.)—I understand you hardly consider it practicable to prohibit the making of bunds across the rivers altogether?—I think it would be very difficult to do it.
- 46. Q. Would it he possible to ascertain the potentialities of the rivers and decide where bunds should be erected?—

Mr. W. S. Bremner.

25 Oct. 02.

Mr. W. S. Yes, that might be done. Landlerds have certain rights Bremner. now; I presums you would not buy them out.

47. Q. The rights are assertained ?-Yes.

- 48. Q. You said you had roads as well as huildings; do yoo find that the work of irrigation officers is interfered with hy their other duties?—This is a comparatively light irrigation division; the area irrigated is 90,000 acres.
- 49. Q. Is it within your power to grant remissions ?— For failars of crop we grant ten-anon remission.
- 50. Q. The total remission is small?—Yes, amount is granted every year owing to blight, etc.
- 51. Q. You don't limit the remission to failure of .orop?
  -No, if there is a failure of water we give total remission.

52. Q. That is very rare, I soppose ?- Yea.

- 53. Q. What is the agency for determining the remission, do you inspect yourself?—The Sab-divisional Officer has a zilladar and other officere; he either inspects himself or deputes a zilladar to do it; they go to the spot and take the evidence of the patrol and headman of the village.
- 54. Q. Remission is not granted without complaint to yos !- No.
- 55. Q. As regards repair of pains; Mr. Oldham recommends interference by the Collector only on the compleint of caltirators; woold you go further; do you wish repairs to be enforced marely on inspection?—I think repairs should be enforced on the iospectico of some responsible officer.
- 56. Q. You would not wait for the complaint of the cultivators f-They would not complain.
- 57. Q. Would not that mean an enormons amount of work; the maintenance of a considerable establishment !-I suppose two sapervisors for Gya would be eacagh.

58. Q. And nobody under them ?-No.

- 59. Q. You woold not recommend any such inspection in the case of ahars?—Ahars in Gya are kept in fairly good order.
- 60. Q. (Mr. Rajaratna Mudaliar.)—As regards the measurement of irrigated lands, who cheeks the zilladar's measurements ?- The amin measures and the zilladar
  - 61. Q. It does not go to any higher officer P-No.
- 62. Q. The measurement of zilledar is sufficient Pgreater part of the area is cadastrally surveyed and it is takeo from that.
- 63. Q. Are the blocks demarcated with etones P-No, on the endastral map they are bounded by a lins; the amin takes the map and fills in the block; he measures every field within the line.
- 64. Q. Supposing a man cultivates beyond the line? Then we cannot assess him; we cannot assess beyond the boundary; be gets the henefit of it.
- 65. Q. A block may he 50 acres, he may irrigate 10 ecres beyond the line?—Then he gets the benefit.
- 66. Q. Don't you fine him !-- Under the law we cannot do anything; we merely make a acte of it.
- 67. Q. (Mr. Muir-Mackenzie.)-Do you think a very mach larger area is irrigated than is ontered in the leases? --Yes.
- 68. Q. Don't you think it would be reasonable to assess a man who goes outside his block?—We cannot do it.
  - 69. Q. (The President.)-I think it is a very good thing

- and tends to encourage economy of water. If a msn irrigates his track of, say, 50 acres and thinks he can add 10 acres to it, it will be to the advantage of the country?

  —We take good care not to give out lesses to blocks from which water could be easily taken beyond the boondaries.
- 70. Q. (Mr. Muir-Mackenzie.)—Don't' you think it would be reasonable to obargo something for water that is drained out?—It would lead to a great deal of complaint; you turn the water to their lands; they don't come and take it.
- 71. Q. (Mr. Rajaratna Mudaliar.)—What is the poy of a zilladar?—Rs. 50 to Rs. 100.
- 72. Q. The Sub-divisional Officers do not cheek the figures of the zilladar; do they P-No.
- 73. Q. Is there any rale on the sabject ?-No, the block system prevents any wrong measurement; after measure-ment of the area the bleek is taken out of the map and a comparison made.
- 74. Q. In the absence of demarcation, do you tbink the block system is of any nse?—The block system cashles us to obeck the area.
- 75. Q. How is the excess aree discovered?—The patrol after a little practice can very easily tell from the map.
- 76. Q. Since the excess area is not obarged for, do you think there is any inducement on the part of the patrol to bring it to your notice? Can he not be easily bought off? Dring it to yoar noticer. An ne not be easily booght our —I dere say he can, but we can catch him and then his is panished. We make it our business to give out leases to sach blocks, as we will not loss by. The block is demarcated by a ridge all round, that is one of the conditions of granting a soven years' lease; the caltivators make a ridge 18 inches high and a foot wide at the top.
- 77. Q. (Mr. Allen.) You spoke of a considerable area Proceedings are some powers of a considerable area being irrigated for which nothing is paid, can you give any figore?—It varies with the different years; oar casals supply enough water to irrigate the whols area in a dry year; if yon get one iach of ram 33 per cent. goes beyond the boundary.
- 78. Q. About this Gyaquestion you say two enpervisors could go over the district and see after the pains; what is the number of pains?—150 to 200.
- 79. Q. Have you any idea of the mileage?—I don't know. If the supervisore started in November, they would have finished the inspection of these pains by January.
- So. Q. Is your scheme confined to the main pains?—Yes, I should only take up the main pains and ensure that they got a good supply.
- S1. Q. It is the head-work that you would confice your-self to !- Chiefly.
- S2. Q. We have had a proposal from Mr. Oldbam that the Collector should look after streams in Gra. How many ahars would there be?—They would run into a thousand. There is a great part of Gra where there is no irrigation whatever; the northern half only would have to be confident. be coosidered.

12

- 83. Q. There is probably one ahar in each village?—About that. There are very little south of a liae taken from Anraogabad to Nawada.
- 84 Q. Yon said irrigation would give 2 mannds of paddy per nero; what do your crop cattings show irrigated per field?—They vary very mach. Unirrigated crop would give ynn 17; irrigated comes to about 20.
  - 85. Q. Is that in a year of good rainfall ?- Yes.

WITNESS No. 18.—BABU SARODA SUNDER PAL, Executive Engineer, Boxar Division.

(Replies to printed questions.)

Babu Strode Eunser Pal.

#### A.-GENERAL.

- The answers refer to that portion of the district of 25 Oct. 02. Shahabad which is commanded by the Sone Canals. I bayo heen employed oo irrigation works in this district for the last seven years and-a-half.
  - 2. Statement attached.
  - 3. (1) No.
  - (2) No.
  - (3) No. The caltivators do not care much to manuro ordinary fields, nor have they got safficient for all their The caltivators do not care much to manuro.
  - (4) Hardly any. There are black soils to which irrigation does not do much good, bat such soils are not extensive.
- In ease of failare of raiofall, such soils also sometimes 1squiro water for soltivation.
- (5) Yes. The maximum capacity of the Sone Canals has almost been fully leased out, and in case of drought some of the area under command cannot be irrigated or cultivated. (6) No.
  - (7) Yes. There is some obstacle where the cultivators
- have got no right of ocenpancy, nor can they claim any fixity of root.
  - (9) No reason I know of, except those noted above.
- 4. I bays not got much personal knowledge on this point. For the land irrigated from the Sone Canal system, the land

Babu

Sunder Pal.

25 Oct. 02.

rest is onhanced by the zamindars when the lands come under a long-term lease. I think the existing provisions are sufficiently liberal.

5. I have got no personal knowledge on this point.

6. Not much. The oultivators will migrate to the irrigated area, if it be not too far off their old homes. During my tours in the interior of this district, I have come scress some helf-descreed villages situated far from the canals, from which the cultivators are said to have migrated to irrigated areas. Instances are villages Pachonna, Bisi, Besswan, Dohra and Hothna. The people are very anxious to have the irrigation extended. to have the irrigation extended.

#### B .- CANALS OF CONTINUOUS FLOW.

- 7. (1) One and-a-half times nearly.
- (2) Almost dnuble.
- (3) (a) Not much.
  - (b) Double.
  - (c) Ten times.
- 8. (a) About nno aud-a-half times.
  - (b) In a year of drought the crop on most of the unirrigated area ranges from nominal crop to almost or total failure, and the difference becomes out of proportion.
- 9. (1) Rs. 2 for the rabi, Rs. 2-8 for long-term lesse, and Rs. 3-8 for annual kharif and for rice, and Rs. 4-8 for the hot-weather crop in form of water-rate.
  - (2) Rs. 2 to Rs. 8 in the form of roat.
- 10. The construction of suitable channels is necessary. This is done mostly by the cultivators and sometimes by the hudderds. In the latter case the landlord gets the channel tent for the use of his channel from the tenants. Where the cultivators make the channel, their scennity consists in the certainty of tenure and expectation of good yield.
- 11. No demand I know of has been done to the people. The sandy soils are improved rather than deteriorated by irrigation. Too profuse, too extensive, and too frequent irrigation, which the cultivators are prone to take, waterlog the soil, and generate malaria, and thereby deteriorate the climate. This can possibly be remedled by proper draining of the lands and restriction of anply to proper quantities just necessary for the maturing of the crops. This will come on gradually as the cultivators are taught their necessities by proper enforcement, with discretion, of their necessities by proper enforcement, with discretion, of the intermission of supply (tatit) according to the necessity of the crop. The irrigation and its evil are of 25 years' standing. I think it is not increasing. Intermission in the supply by tatil system was introduced a few years upon and is being gradually enforced everywhere, and is expected to check and dimbuish the syll. I have not get experieure of draining the irrigated acres : I believe drainage will improve the lands as well as the climate. There is no improved drainage system in the district coming within my observation.

- 23. There are no big tanks in the district I know of hardly any worth the name.
- (1) The small tanks, called akaras, are filled with drainago water of the country.
- .2) The water is taken to the fields through small channels, and mostly lifted to them by means of ordinary nater-lifts, such na dhouries, dum, etc.
  - (3) (a) Throughout the year, except the hot months.
    - (b) During the rainy season only.
    - (c) Nil.
- (4) That varies from 50 to 400 bighas necording to the size of the tank.
  - 2'L (1) About one and-a-balf times from big abaras.
- (2) Hardly any, as the tank generally fails during the year of drought.
  - (B) (a) Nil.
    - (b) Double.
    - (c) Nil.

- 25. (1) 25 to 75 per cent. according to the delay.
  - (2) 90 per cent., and if not, cent, per cent.
  - 26. In year of scenty rainfall well irrigation is resorted to at the end of the season. This is very essential, but few can do it, and the results cannot be very satisfactory for the rice cultivation.

27. (1) 50 per cent.

- (2) Nil.
- 28. (1) Nothing, except manual labour for repairs to the tank and channels.
- (2) Not much, although they have to pay a little enbanced rate of rent on area irrigable.
- (8) Nothing.
- 20. The expenditure is in lifting the water to the fields and making the channel. This is down by the tonants.
- 30. By the touents. I have taken no notes on these points. I think no legislation is required.
- 31. Other owners got water only, if available, at a nominal nest. No legislation exists for this district, nor any required.
- 32. Yes, by advances under the Land Improvement Leans Act.
- 33. The silt deposited is not much, and is generally removed by tenants by the hand, whonever necessary.

#### E .- WELLS.

- 34 I have examined carefully only the area commanded by the Sone Canals.
- (1) The average depth of water in the permanent wells vary from 10 to 30 feet according to the localities.
- (2) The supply is from both percelation and springs, and that from percelation generally fails in years of drought, and that from spring, partly. I know of no well boing unfit for use from the water becoming too saline.
- (3) The average cost of construction varies with the dimension and the depth to which it is sunk. I have seen stells constructed for Rs. 100 only. But big wells cost sometimes as much as Rs. 600.
- (4) The permanent wells last for a long time. I have seen wells in use, which are said to have been constructed two or three hundred years ago.
- (0) The water is usually raised by mots worked by bullocks, and also by latha worked by mon.
- (6) That depends on the size of the well and the depth of mater in the same. Some wells will irrigate as much as 25 lighas, and others not oven 4 bighas.
  - (7) I cannot say.
  - 35. (1) One and-a-half times.
  - (2) As much as doublo.
  - (3) (a) Nil.
    - (b) About double.
    - (c) About five times.
- 36. (1) Cent. per cent. by substituting more for less valuable crop.
- (2) Ten times, as the produce on the unirrigated area in n year of drought is very small, if any at all.
- 87. (1) About double when the well is made by the cartindar, and nothing when it is made by the caltivators themselves.
  - (2) Nothing.
- 38. (1) The cultivators have got local experience, and that is their guide; no serious difficulty is experienced.
- (2) Yes. For want of capital in many cases. I know of no such assistance being offered.
- 89. No. The zamindars will do it when they are anreof getting their lands outlivated at an enhanced rate.
- 40. Yes. They are a great protection against drought. Their construction may be encouraged in a year of scanty rainfall by advances of money at the rate of its. 5 ta Rs. 10 for each well, including the price of mot, etc., to be recovered from the cultivators when the crop is harvested.

### Rainfall statement for the last ten years.

- 1. Q. (The President.)-You are Executive Englacer of the Brant Division ?-Yes.
- 2. Q. Have you been long in the Division? I was there twee-once in 1895-96 and again last year.
- 3. Q. You say in paragraph 4" there are black soils to which irrigation does not do much good." What ore these black soils; does rice grow on them?—They grow very little rice; they generally grow wheat.
- 4. Q. Is it a good erop of wheat!-Yes, the area is pretty large.
  - 5. Q. Do they try cotton upon it?—No.
- 6. Q. Have you seen that soil in other parts of the country ?-No.
- 7. Q. Where were you before you went to Burari-I was all along in Shahabad.
- 8. Q. The Buxar Canal preses through Bhabua?-Yes, a part of it does.
  - 9. Q. Do you know Bhabua well?-Yes.
- 10. Q. Do you know this scheme for a reservoir in the hills ?—Yes, I have been in the hills to investigate it.
- 11. Q. Did you take any levels?—No, the season was not suitable for it; it was in the rains.
- 12. Q. Did you make any observations?—I only went over the country to see if the sites were sultable for rico cultivation.
- 13. Q. Did you inspect the site?—I saw the Dargaiti sile; that was the smaller one.
- 14. Q. The country is all covered with jungle?-Yer, where the re-errors are proposed to be constructed.
- 16. Q. Do you think people would be glad to baye brigation there?—I think they would readily take water.
- 16. Q. Could suisiting be done to supply the Buxar Canal; could not send more nator into it?—People would take water gladly, but the Buxar Canal cannot be supplied from these reservoirs. The levels will not allow of it.
- 17. Q. In reply to question 11 you allude to the evils done by over-strip stron; is there much of this evil ?-Yes.
- 18. Q. You say in your note "too profuse, too extensive and too frequent freighten, which the cultivators are grone to take, nater-log the soil and generate malaria and thereby deteriorate the climate." Is there much of this cril?—
- 19. Q. And is the land injured !- The climate is injured.
- 20. Q. About what pre-portion of the village land do you irrigate f-50 to 60 per cent.
  - 21. Q. That is rice !- Yes, besides that we also get some rabi.
  - 22. Q. You say the climate is injured. Is there clear proof of that?—There is more fever now than before.
  - 23. Q. Yon say in the same paragraph—" Intermission in the supply by tatil system was introduced a few years ago, and is being gradually enforced everywhere and is expected to check and diminish the evil." Has it checked the evil f—It has not already checked the evil. If it is enforced during the rabial and dry weather seasons, there will probably be no oril.

- 24. Q. As regards the Bhabus Sub-division, supposing it is too expensive to make the Karamunasa reservoir, what could be done for the Division to ward off famine?—Utilize the water of the local streams.
  - 25. Q. Could nothing be done by wells P-No.
  - 26. Q. Why?-They irrigate very little from well.
- 27. Q. In other parts of India they irrigate a great deal?—I think the cultivators here are lary.
- 23. Q. Could anything more be done by chare?—There are some chars, but they are not of much use. In a year of deficient rainfall they do not fill up.
- 29. Q. Have you navigation in the Buxar Division ?-Very little now.
  - 30. Q. Why is that !- The traffic goes by rall.
- 31. Q. Did the people like it f-When there was no railway people went by attemer.
  - 32. Q. Are there locks in the Ganges?-Yes.
- 33. Q. Are they used?—Very little. Hardly any boats now go up the Baxar Canal.
- 31. Q. Are there locks there?-You but they are seldom nucd.
- 35. Q. (Sir Thomas Higham.)—You refer in your memo. to lighas; what is a lighas?—The standard Bihar digha, the of an acre.
- 36. Q. You say that the sayate get a great deal more after then as necessary for their crops. What is the standard water them is mecessary for their crops. What is the supply ?-One cul is foot per second for 50 Lighas.
- Si. Q. If you have a block of 100 seres, you give cuble feet per second night and day? Yes, for ten days.
- 35. Q Do you think that too much, or do they take too well?—I think that is too much. I have tried in Arrah to get it reduced to 62% acres and have succeeded.
- 39. Q. Is that a regular rule of canals to allow one cubic foot per recoud for 50 acres! - Formerly it was
- 40. Q. Is that the rule of the Superintending Engineer?
  -Yes. But for the last three years we have changed that.
- 41. Q. You only allow that ten days out of the 15?-
- 42 Q. How did you ascertain that ?- I found it out by experiment.
- 43. Q Some of our witnesses say they don't get enough of water ?—In certain Sub-divisions there was no complaint of short supply.
- 44. Q. The water run continuously on the fields, or is it shut off when a field is filled and passed on to the next? -It runs continuously for ten days.
- 45. Q. You say there are obstacles to the extension of irrigation; what are they f.—They will not take long leaves, because they are not certain of remaining in possession of the fields; they might be turned off while remaining liable. for the mater-rate.
- 45. Q. Are the only people who take long leases those who have rights of occupancy f-Mostly.
- 47. Q. (Mr. Muir-Mackenzie.)—In reply to question 4 you say "for the land irrigated from the Sone Canal

system the land rout is enhanced by the zamindars when the lands some under a long-term lease." Does that apply equally to lands in which the rents are cash or bhack the Yes, to both.

- 48, Q. We have had some evidence that the zamindars enhance routs; when there is a cash rout, how does he mannes it?—First, he makes difficulties in irrigation; he will arrange that the people should not get water; when they do irrigate their fields and see the benefit of irrigation and ask for long lease he puts difficulties in the way.
- 49. Q. Do you know any instances of this?—I have seen rents of fields raised from 4 nums to Rs. 4.
- 50. Q. Were these occupancy too ants or tenants-nt-will P-I don't know.
- 51. Q. You say in answer to question 34 (4) "the permanent wells last for a long time. I have seen wells in use which are said to have been constructed two or three hundred years ago." Are these large and expensive wells? -Yes.
- 52. Q. I suppose these wells that cost Rs. 100 would not last very long ?-No.
- · 53. Q. What is the cost of the big wells ?- From Rs. 500 to Rs. 1,000.
  - 54. Q. Have they 8 or 4 mote?-Yes.
- 55. Q. And they are pakka ?-Yes.
- 56. Q. Would a hundred rupes well have a single mot?
- 57. Q. (Mr. Rajaratna Mudaliar.)—With regard to what you said about 1 ouble foot of water being sufficient for 100 lighas, what was the nature of the experiments you made?—I took a note of the water discharged from you made?—I took a note of the water discharged fro the ontlots for 7 or 8 days and then worked out the area.
- 58. Q. Did you took the authors from the fields in which you made experiments !—Yes.

- 59. Q. In different systems of irrigation?—I compared the outturn with the provious experiments on the same fields; it was not inferior.
  - Bahu Saroda
  - 25 Oct. 02.
- 60. Q. How many experiments have you made in that way ?-Ton in each year.
  - 61. Q. As regards actual outtnra ?-Yes.
  - 62. Q. And in the same fields ?-Yes.
- 63. Q. Did not the raiguts complain that owing to intermittent supply their outturn was diminished?—No, they did not complain to me at loost.
- 64. Q. (Mr. Muir-Mackenzic.) Yon know Bhabua? -
- 65. Q. Do you feel confident that the people there will readily take irrigation P-You.
- 66. Q. Supposing there was a year of good rainfall immediately after water is introduced will the people hang back, do you think?—In certain parts they cannot do aithout water even in a year of good rainfall.
- 67. Q. (Mr. Allen.)-You said non-occopancy tonants would not take long leases for fear of being turned off and still be liable for the water-rate, would the Irrigation Department not reduce rates?—In some instances the men fled from the villages and we did reduce the rates.
- 69. Q. You would not levy your water-rates on a man who had abaodoned his holding P—No.
- 69. Q. With regard to what you said about enhanced rents, what sort of land was that on which the rents were raised?—Sandy.
- 70. Q. Is salami paid by raiyats before they work a well P—I have not heard of it.
- 71 Q. (Mr. Muir-Nackenzie.)—Can you give instances where rents were enhanced?—Yes, in Deogons, Dharupur and Amai. These came to my personal knowledge in the

### THIRD DAY.

#### Muzasfarpur, 27th October 1902.

### WITKESS No. 10 .- ME. E. T. SEALY, District Engineer of Champaran.

- 1. Q. (The President.)—You are, 1 understand, District Engineer in the Champaran District?—Yes.
- 2. Q. And have you been there for a long time?-Twenty-six years.
- 3. Q. Then you must have even it through all the so-called famines?—I did not see it in the first year of famine. I was in Clapm in 1874. But I have seen everything rinco 1676 whom I came here.
- 4. Q Looking at the number of men employed on famine relief work, you never had works on a very large scale in Champaran?—In 1896-97 there was a good deal, but not before.
- 5. Q. I see that in the north-west part nine per cent. were employed and the rest from three to eight per cent. in the south !- Yes.
- 6. Q. From what you know of the district do you think that famine protection is necessary all through it?—In some years it is of great advantage.
- 7. Q. In all parts of the district ?—All north of the Bikrana probably.
- 8. Q. Has there been any distress south of the Sikrana?—Not to the same extent as in the north.
  - 9. Q. What is that due to; the rainfall !- Yes.
- 10. Q. I gather from these papers that there is practically no irrigation south of the Sikrana?—No, the people will not irrigate south of the Sikrana. They say the soil deteriorates from irrigation, and they must be very hard up indeed to use water. I have no doubt it would be useful at times, but then they are afraid to use it, because they say that if once they are water, they will always have to use it afterwards.
- 11. Q. There was no fumino there?—There has been scarcity, but I should not call it actual famino.

- 12. Q. The state of the country is better here than north of the river I North of the river is principally rice cultivation, and when the rice feels, the cultivators have nothing to fall lack upon. South of the river they have several crops, so that if they lose one they generally get one of the others.
- 13. Q. That is really the difference?-That is the principal reason.
- 14. Q. So in a year of drought, if the people to the north of the Sikrana could turn themselves to something besides rice, they would be just as well off as those to the south of the river?—You cannot grow rubi there without irrigation, or the rabi you do grow is very poor.
- 15. Q. Have you been concerned in these irrigation schemes in the Tribeni?—I have always taken great interest in these schemes, and during the familie of 1897 I was in charge of the famine work on the Tribeni Canal.
- 16. Q. But you have not to do with it now. It is an Imperial work ?—Yes,
  17. Q. And the other schemes have you anything to do
- with them?—Yes, with a small scheme near Rammaggar where in 1897 we made n pain. That has been under my charge since then. Subscriptions are levied on the people that want the water: they pay the money when asked
- 18. Q. What river is that from !-It is from the Massan
- 19. Q. Is the irrigation very extensive f-About 15 miles in length and an average of 3 or 4 miles in width.
- 20. Q. Have you been called upon to do much or to do anything for the pain; I mean for the clearance of it or for the rectifying of it in any way?—I have a man in charge who takes steps under my orders to carry out any work that is necessary.

- Mr. R. T. Sealy.
- 27 Oct. 02. ve
- 21. Q. Are district funds called upon to du that ?—It is entirely paid for by subscriptions levied according to the area of irrigation.
  - 22. Q. Does that work well?—Yes, it works without any trouble.
  - 23. Q. There is na great difficulty about getting the maney ?—I have had no difficulty. They send their money ta the Callectar on the estimate made aut by me.
  - 24. Q. Then every time you have work to do, have you to ask them whether they are willing to pay for it?—No We levy a rate per bighs per year, and I have had a surplus generally and that is brought on to the next year.
    - 25. Q. Then you frame a hudget far tha year? -Yes.
  - 26. Q. How much does it cost a bigha?—Last year it was six annas. This year there was a surplas and so we braught it down to three annas.
    - 27. Q. What is the bigha hero?-93 to 10 haths.
  - 23. Q. What part af an acre?—It would be about two acres per bigha. A ligha a little further to the west is as much as 13 haths.
  - 29. Q Naw within this cess have you ever carried an any masanry wark?—No, we have not done anything. We have built a small wall across one pain, but you would not call it a masonry wark.
  - 30. Q. Lauld the system you are warking apon be extended so as to get proper masanry weirs for these pains?—Yes, I think so.
  - 31. Q. Da yau consider they are necessary ?—I think they are very necessary. They would be a great advantaga to the country generally.
  - 32. Q. Is there mach dispute as regards the irrigation? Do the people far down the pains make it a grievance that they'are cut aff from the water by the upper people?—They complain that they do not get as much water as they wand like. That af course is a thing we have no control over. The water is limited to the minfall.
  - 33. Q. Is there any sart af understanding, written or unwritten, as regards each man's share?—On aur pain we divide the whale length inta four sections. The duties are fixed on the area, and each section is watered far so many days; and this is carried out regularly right through.
  - 34 Q. (Sir Thomas Higham.) There are no pains above yours? No.
  - 35. Q. (The President.)—The irrigation in the upper part is obliged to be used to let the water pass?—Yes.
  - 3c. Q. And is that carried out to the satisfaction of the people generally, ar are there disputes P—I have not heard af any cases where it has been fingrantly upset.
  - 37. Q. Do you shut them up?—Yes. If it were left to the people, they would not shut it up.
  - 38. Q. What yan are saying applies to the pains in general, ar just to that particular one from the Masan? You are aware that there are a number of rivers in the district used for irrigatian. Daes what you have said apply to them all?—Certainly.
  - "(The President.)—Mr. Kilby has given us a paper in which he says:—"When it is found that any one person is appropriating to his awn use the whale of the water of any particular stream, the order that is generally passed is that he must make a han, and allow half af the water to pass an. This is unsatisfactory, as abvinusly those who have bunds high up the stream get a great deal more water than those helaw. A han, one can be easily tampered with. Anyane can stap it at night with a few basketfuls af earth. Detection in such cases is very difficult, as it is situated in the locality of peaple who wish to stap it and far fram those persons living lawer down tha stream who wish it to remain open. The hanj system is in every way unsatisfactory. A better system is af fixing dates an which villages along the caurse of any stream shall he allowed to take water from it. This is done in the case of the Masan pain which is under, the cantrol of the Executiva Engineer. Gavernment has a right to the cantrol of tho water of this pain as it was constructed by a famine work. It is almost impossible, however, to induce natives to accept this system in other streams, and at present it is impossible to compel them." Is that your own experience?—It is very difficult to carry that out in ather streams. The cast of making. a bund across a big stream wauld mean a great deal af maney.
  - 39. Q. Would the agriculturists make a great row if interfered with ?—I think they would da what they were told. I think the Callectar's order would be quite sufficient.

- 40. Q. Mr. Kilby goes on to say that the only way to compel the people is to bring these systems under the Irrigation Act to dispose of disputes summarily. Do you think there is any accessity for that?—It would prahably make it more casy.
- 41. Q. Wauld it be popular?—Fes, I think it would be papular, because villagers are continually asking the Collector and other officers to assist them by making the different villages who want the water combine. They never combine an their awn initiative.
- 42. Q. Is it not prabable that some af the more powerful people get far more water than they are entitled to, and that they would hatterly resent anything af that kind?—I think sa.
- . 43. Q. They would be opposed to any reform of this sert?—Na, I den't think they would do that, because they would he served so much hetter. I don't think they would object to it.
- 44. Q. The mancy that you receive from this cess, which you say is so many annas on the bigha, is it put into one common parso f—It is held by the Callector and drawn on by me as I require it.
- 45. Q. There may he this feature that a man upon one canal may be paying a coss, while far that particular year he will not get the henefit of it?—I think they all got the benefit during the year they pay for it.
- 46. Q. Supposing it was determined to introduce masoary head-works into these pains, would a man on A. Cansi he willing to man a cess to huild one for the henefit of a man, or B. Canal knowing he would get no benefit?—The first work required would be at the head of the canals and that would serve everyhody.
- 47. Q. Is there enough comman spirit among them to make them agree to pay a certain cess, year by year, knowing that during certain years they would not get any advantage?—They would get same advantage from it, and I don't think there would he any difficulty in that. Of course that would he one of the things that might crop up, and hy bringing it under the Irrigation Act, you would do away with any difficulty.
- 48. Q. I notice that south of the Sikrana, at any rate in the Saran District, there is a great deal of well irrigation and very little in Champaran. Why is that?—The people in Saran make very much mare use of the limited amount of water that there is than they da in Champaran. That is practically hecause there is a thicker population there.
- 49. Q. In Champaran, according to this statement, there are only 1,413 acres under well irrigation, whereas in Saran it is 141,586 acres !—Yes.
- 50. Q. What is the reason of that great difference?—The sparsity of the papulation has samething to do with it. In Champaran there is very much more land than they can cultivate, and the papulation not being large, they have not got the labour to do it.
- 51. Q. Have you any other saggestions you would make as regards the protective works to avert famine?—There are several, but no schemes have been brought up sufficiently. Generally speaking, I would make more ase of the hill streams. (Witness painted aut several rivers an a map and described what could be dane in cannection with them.)

ĸ.

- 52. Q. In the Preliminary Reports on three schemes for irrigation in the Champaran District yau say—"I think all three af the schemes will be most valuable to the country served, not only in dry years, hat also in ordinary years." In dry years would these streams have water in thom?—There is a certain amount of water in them.
- 53. Q. During the dry year af 1896-97 was there a certain supply coming down?—There was. The Pandai did a good deal of irrigation in that year.
- 54. Q: Do you keep up a list of famina relief works?

  —This is the list (hands it ia).
- 55. Q. They are almost all roads?-Mostly roads and tanks.
- 56. Q. Are the tanks under you ?—Yes, they would be, I think.
- 57. Q: As a matter of fact, there are a number of taukshere?—Yes, there are a great number in the district.
- 58. Q. Are these tanks excavated or made by bauding up the valley?—There are na valleys in the district that would be saitable.
- 59. Q. Are there any excavated tanks really large enough to irrigate any area worth speaking of I—They irrigate a few bighas round the tank, but there are very few of them large enough to irrigate uny extent of country. There are

- 60. Q. How deep?—That depends upon the reinfall. There are generally six or eight feet of water in them. Those of course are exceptional. There are numbers which would be three or four hundred feet square.
- 61. Q. Such as they are, are they worth having for the sake of the irrigation they do?—There is always a certain amount of irrigation done round them, but they are principally used for cottle watering.
- 62. Q. (Sir Thomas Higham.)—Last fomine there were a great many tanks dug in this district?—Yes.
- 63. Q. Are you in charge of mony tanks?—Only on the Triheni. In 1896 I had to do with some tanks, but after the first two months I was sont up to Ramnuggur on the Tribeni Canal and I had nothing to do with them.
- 64. Q. Have those tanks been any good?-They have been very meeful.
- 65. Q. Do they bold water ?- Yes.
- 66. Q. Generally for cattle watering?—A small amount of irrigation is done from them in addition to cattle watering.
- 67. Q. In regard to the Mosan pain, you say you recover every year from the people the cost of oil repoirs?—Yes. They have got to pay up before the work takes ploce. They have got to pay of the beginning of the year for the work of that year, and if there is any surplus, it is carried on to the next year and the eess would be reduced.
  - 68. Q. You moke an estimoto every year ?-Yes.
- 69: Q. Do you charge them anything for establishment?—They have to pay for a munshi and two or three peans. They do not pay anything towards my salary.
- 70. Q. And they do not pay anything beyond actual cost of repairs. They do not pay interest! No, none. They could not pay interest: it is their own money.
- 71. Q. What is the area that they irrigate?—It is about 60 square miles altogether, I should think.
- 72. Q. Sixty square miles is commanded by the pain? -Yes.
- 73. Q. How many acros? You say that 5,390 acros are irrigated by the Government works?—I am not sure whether the Masan pain has been entered in this or not.
- 74. Q. What ore the Government works?-The Ecdari or the Modhubund Canal.
- 75. Q. Have you any idea what the Masan irrigates?—I am afraid I have not brought ony figures down with me, but I could get them and seed them to you.
- 76. Q. What does it run to. I want an idea of the size. Does it irrigate two thousand, five thousand, or ten thousand arres ?—I should think ten thousand of least. The project, of course, has been improved and the irrigated 'areo will be increased.
- 77. Q. Whot do they pay for annual maintenance f—It was six annual last year; three annual this year. That is per ligha, or two aeres. Three annual is obout the average.
- 78; Q. What do you strike that on; on the area irrigated in the previous year?—Yes. We hove got to find out first of all if the people will toke the water, and thus, if the whole of the people who can get water could take it, the area they will get irrigated is estimated and it is struck on that.
- 79. Q. You strike it on the aree you think they will irrigate !- Yes.
- 80. Q. Do they put in applications?—It is something to that effect. We send round to them and ask them if they wish to take water, and then if they say "yes" we send them the amounts they have to pay.
- 81. Q. And if they say they do not want it?—We do not give them any water if we can help it.
- 83. Q. (The President.)—Can yoo prevent them getting water ?—Not in all cases, because the pains are not sufficiently well carried out to be oble to prevent water going
- 83. Q. Have you any legal power to stop them?—I prosecuted a man this year for stopping water and taking it into his field before he had paid for it, and he was fined.
- 84. Q. (Sir Thomas Higham.)—Do the areas they say that they are willing to take water for vary much from year to year f—They do somstimes.
- 85. Q. When they send in their applications they do not know what the year is going to turn out like? - No.

- rome tanks one thousand fect long and three or four hnn-red feet wide.

  86. Q. Suppose a man does not want to take water first. Mr. E. T. and wants to take it ofterwards, what happens?—If he paid Sealv. his whole assessment, we woold allow him to do thot.
  - 87. Q. You would not charge him onything extra?—I did chorge a man extra once. That was the same case where he was fined in the Court. I charged him double. But after all double does not come to very much.
  - 88. Q. I suppose you do all that on your own authority?
    -The Collector very often looks into these things.
  - 89. Q. It is done by your personal influence. You have no particular locus standi in that matter?—I have no legal authority of course.
  - 90. Q. You have no measurement of the areas at the end of the season?—No. We take the areas from the jama-
  - 91. Yoo say you work the lengths by rotation. Do yoo close them ?-Y cs.
    - 92. Q. You do not kove it to the people?-No.
    - 03. Q. That is oll chorged for in the cess? -Yes.
  - 94. Q. Has the Board onything to do with the matter? Nothing at all.
  - 95. Q. They do not odvance any money for it? -No.
  - 96. Q. But you are the District Board Engineer; ore you not? How did you come to have anything to do with it?—The Chairman of the District Board asked me to take it up.
  - 97. Q. You soy where there ore a number of these pains the people ore clearly complaints ngainst each other. Do you think they would like Government taking the management of the distribution into their hands?—I fancy in a great many esses they
    - 98. Q. You think it would be popular ?-Yes.
  - 99. Q. Is there much damage from floods?—Floods do very little damage. There is a considerable fall in the country, so that the floods run off very quickly. I have seen very little damage done by floods.
    - 100. Q. There is no water-logging P-No.
  - 101. Q. Do they run the water off during floods?—It runs from field to field until it gets into the drains.
  - 102. Q. (Mr. Rajaratna Mudaliar.)-Apparently the cess you talk obout is not levied under any enorment. It is a sort of mutual arrangement between the canal officers oud the tenouts who irrighte the lands?—It is a sort of arrangement between the Collector and the tenants.
  - 103. Q. Is the cess levied on the area actually irrigated, or on the area of the village?—From the area it is possible to irrigate. Some years of course when there is a short rainfall, and we find there is not enough water to irrigate the whole plot, we key the cess on the orea commanded. The cess is used for manoging the pain, and all that has to be paid for, so that we could not give it back even in a year when there would have been no woter.
  - 104. Q. This cess is in oddition to the water rate?—There is no water rate. They pay nothing else.
  - 105. Q. And the pains belong to Government?poins were originally made during the famine of 1897 as a fomine work. There ere o greet many other pains, however, with which we have nothing to do. They are entirely carried on by the zamindars.
    - 106. Q. So you do not levy ony woter rote of all? No.
  - 107. Q. The cess is proctically o water rate? The cess is simply for keeping the pains in order.
  - 108. Q. Is there ony objection to abolishing the cess and substituting a water rate?—I think there would be a great deal of difficulty in doing that. We would wont o large establishment for thot. The people of present are paying as lightly as can be done.
  - 109. Q. (The President.)—You estimate the eess?—The Collector keeps the money end I indent upon him as it is
  - 110. Q. Do you think that the zamindars would be willing to construct new pains if professional advice were given them as to sites end other things?—Well, it depends whether they are well enough off to corry on the work.
  - 111. Q. Could they not borrow from Government?-I hove no doubt they would do a good deal in that way if they could get the mensy from Government, and if further focilities were given to them for ocquiring lands.
  - 112. Q. The evidence we had at Bankipore was to the effect that there was greet reluctance on the part of

Mr. E. T. zamindars and tenants to take loans from Government?—I

Sealy. do not know enough about that to be able to give valuable

27 Oct. 02.

113. Q. (Sir Thomas Higham.)—Do you know what was spent on the Masan pain?—It came to about Rs. 2,000; it might have been a little more. Its upkeep costs from Rs. 1,000 to Rs. 2,000 a year.

### WITNESS No. 20.-Mn. A. DUNSFORD, Moorla Estate, Champaran.

Mr. A. Dunsford. 27 Oct. 02.

- · 1. Q. (The President.)—I understand you are Assistant to the Manager of the Ramgurwa Concern ?—Yes.
- 2. Q. Have you had long experience of this part of the world?—No. I have only heen here about four years.
- 3. Q. You were not here in the last year of serious drought in 1896-97?—No. I was not in the Concern then. That was before I came.
- 4. Q. Where is the estate that you are employed in f-It is in the Motihari District.
- 5. Q. What do you grow there?—Rice and different kinds of pulses. It is a rice country mainly.
- Q. Have yon, from the time you have been there, been in want of irrigation P—No; we have been in no want.
   We have hunded this rivers ourselves.
- 7. Q. And this bunding of the rivers do you find it causes disputes with other zamindars?—Wu have no other zamindars around there. We have it all our own way there.
- 8. Q. Have you any trouble with the Nopalese hunding the rivers?—None whatever. The Nopalese cannot hund the Tilawe river: they hund other rivers.
- 9. Q. Are there any measures that you would advise or works that could be carried out which would improve the situation P—Mr. Harman has advised me to ask Government to grant us small leans for the purpose of making pains for taking water where it will not reach by bunding the river.
- 10. Q. Aud do you propose to make an application?—Yes.
- 11. Q. Have you ever done so hitherto ?-Not yet.
- 12. Q. Is it done hy others?—I don't know round that way at all. There is only one other factory near us.
- 13. Q. Ronghly speaking, above what amount of loan would you wish to have?—About Rs. 6,000.
- 14. Q. is that an indigo country at all?—There wes indigo there up to four yoars ago. There has been indigo there during the last 20 years until four years ago.
- 15. Q. How long does the water in the Trlawe last; all the year round?—Yes. It is a good rivor.
- 16. Q. Thore has been a proposal for making an irrigation canal from that river. The Concern you are in; has it got a large area of lands?—We have got about 36,000 acres.
- 17. Q. I see the project here was to supply water estimated at 200 acres which would give 10,000 acres of kharif and 5,000 acres of rabi irrigation. Would that be all in your zsmindari?—I caunot possibly say whether that would be only in our zamindari.
- 18. Q. Would you be buttered in your country by having a canal inid down there on eccentiful lines?—I don't think we would want a canal there, but only these pains.
- 19. Q. Of course, if there were a proper canal laid out professionally, it would cost money and there would be a water rate imposed?—It would entuil water rates on the rice. There would be sume difficulty about that. The rayats would make otherious to that.
- 20 Q. You think things are very well as they are?—Yes. All that really is required are just these pains.
- 21. Q. We have had evidence of its being desirable to have masonry sinices at the head of the pains. Do you think that is desirable?—I don't think so. I think just the pains only would do.
- 22. Q. Have you ever had any trouble with the pains being eited up just at the time when water is wanted?—No.
  - 23. Q. You keep them clean yourself?—Yes.
- 21. Q. (Mr. Rojaratna Mudaliar.)—We were told yesterday that in one place a pain, which was about 10 to 15 feet wide at the mouth, became enlarged owing to floods to 100 or 150 feet. In such ceses don't you think that masonry head-works would be of use in regulating the flow of water?—I cannot give you any information on that

- point. This is not likely to happon with na: the bund we make; the river would carry away before any more damage was done.
- 25. Q. In your pains don't floods occasionally pass down?—Occasionally. Our rivers spill over more or less nearly overy year.
- 26. Q. And cause dumags?—We get no damage from floods around thess. Damage is done more or less when the flood-water does not recede soon. The puddy submerged will not be damaged under 48 hours: it is not often it lasts longer.
- 27. Q. So that, so far as the estate in which you are employed is contained, there is no necessity for any masonry works?—None whatever.
- 28. Q. It was suggested by Mr. Oldham that legislation would be desirable to enforce upon the zamiadare the duty of keeping the pains in order; do you think such legislation necessary?—No, I don't think so. The zaminder himself sees that the pains are kept in order. There is no necessity for legislation in our part of the district.
- 20. Q. But; speaking generally as regards zamindars, Mr. Oldham's experience is that pains are very soriously usglected as also the ahars, and that legislation is very essential. What is your view?—Well, of course, judging from one part of the district, I don't consider it is necessary, but I cannot speak as to other zamindars.
- 30. Q. Supposing they were neglected, don't you think the Collector should have the power to interfore and compel zamindars to execute the necessary repairs?—I cannot give un opinion on that point.
- 31. Q. As regards the enhancement of rent, is there any difficulty in enforcing a claim on the part of a zaminder where he constructs works at his own cost?—I don't quite understand the question.
- 32. Q. Supposing a new pain were constructed by a landlord, can be onhance his ront?—No, he cannot enhance his rent.
- 33. Q. There is a provision of the Bengal Tenancy Act which gives him power to enhance rents where he has constructed irrigation works at his own expense?—I don't know. I cannot tell you that. When it is necessary to bund up the river for irrigation, the mysts practically do it; thousands of men turn out and help themselves and we supervise.
- 81. Q. In your estate, if you construct a new pain, you don't subance the rout?—No, we don't.
- 35. Q. Is the sharing (bhack) system in force in your zamindari?—We have both the bhacki and makdi.
- 36. Q. In the bhaoli system you get an enhanced shore of the produce on land converted from unirrigated to irrigated. In the nukdi system, suppose you construct a pain and give irrigation to the tenant, don't you lovy an enhanced cash payment?—There is no actual inercase in the rent. He would have to pay for the labour employed, but that would not affect his jamabundi. I don't think we have the power to increase that.
- 37. Q. If Government constructs a canni and supplies water to the zamiudari, would the zamiudar be willing to pay a water rate for the irrigation supplied f—In one instance I don't think so. We don't want a canni, and there would be no objection in irrigating the zamindari.
- 88. Q. Is there any portion of the zamindari which can be irrigated by any scheme which is now in contemplation?—I don't know whether there is any in the zamindari in our immediato neighbourhood. Wo only want a small loan for pains; otherwise everything is satisfactory.
- 30. Q. Do you think the rate of interest new charged on loans and the time allowed for repayment might be made more libural?—I don't know the terms.
- . 40. Q. 61 per cent. Is the rate of interest and a maximum period of 20 years for repayment?—I cannot give any opinion an until I have taken the advice of the manager. I am only here in his place. The manager considers 61 per cent. reasonable and 20 years generous.

# WITNESS No. 21.-MR. T. BARCLAY, Zasoiodar, Champarau.

With the permission of the President witness made the following statement:-

- "I shoold advocate the extension of the Tribeni Canal across the Sakrana river into a bhangar soil tract of 150 square miles; there is insufficient rainfall there and the crops often foil."
- 1. Q. (The President.)-Have you consulted the Superintending or Chief Engineer about this?-My brother, who used to he Manager, has been in correspondence with the Collector about it. My brother is in England on leave; he and I are partners.
- 2. Q. A note will be taken of your wish. Have you had long experience of this part of the world ?-30 years.
- 3. Q. As regards the pain irrigation, does it work smoothly?—We have bad no experience of pain irrigation.
- 4. Q. Are your lands not irrigated at all ?-No. We hove dove a little with pumps in years when there has been a small rainfall.
- 5. Q. If the Triheni Conal were extended as you propose, would the agriculturists take water overy year, or merely in one year out of five?—In some villages they will take it every year. This particular land heing biangar, the greater part of the land would he irrigated every year.
- 6. Q. As a matter of fact, up to now enlitvation has been carried on merely by reinfall f—Yos, and wells; a very small amount by wells.
- 7. Q. Is well irrigation popular among the people? Do they use it for rice?—No, it is used chiefly for opium and some other crops.
- S. Q. Did the cultivators apply for advances from Government at all for sinking wells ?—They applied to the Opium Department; it is a great opium district.
- 2. Q. Have you know much of the disputes as regards taking water from pains ?—I have had no experience of these pains at all.
  - 10. Q. Are there any ahars in this country ?-No.
- 11. Q. (Sir Thomas Higham.)—In this tract of 150 square miles that you spoke of do they grow rice new?—Yes, in the low-lying loads—chaurs.
  - 12. Q. It depends entirely on the rainfall ?- Yes.
- 13. Q. Have you any idea of the rate the people would be willing to pay for water for their rice?—No, I could not

- say. But I think Rs. 2 to Rs. 2-8 per acre for land irrigated would be paid gladly.
  - 14. Q. Have you any irrigation at all on your own estate?
    -None, except what we do by engines in a bad year.
- 15. Q. Is that done very largely ?—Last year I irrigated over 300 acree of land.
  - 16. Q. Do you pump up water for your tenonts ?-No.
- 17. Q. (Mr. Muir-Mackenzie.)—Are you quite confident of the soil of the Sokrana being suitable for irrigation?—Ae far as my knowledge goes it is the same soil os the Tribeni Cae al is made to irrigate.
- 18. Q. Is the soil south of the Sakrana similar to the soil of the Saran District ?-- I doo't know. I don't think it is.
- 10. Q. Yondon't think there is room for any considerable extension of well irrigation?—It might be done if this scheme is not practicable. If pains were made from the Sakraoo, they would have to raise the level as is done in the Gya District; there is the river which, four to five miles with huttresses, keeps the water up over the level of the country. No dealst that would be expensive. country. No doubt that would be expensive.
- 20. Q. With regard to wells, can yon say whether the number of wells has been greatly increased, in ony part of the district which you know, by the Opium Department?—
  The advances given by the Opium Department are not
- 21. Q. Is there any reason for the unpopularity?—A native gets a couple of hundred rupees and wants to spend it olsewhere, or if he speeds it on a well, he objected to repay it again, and I doubt if he gets long enough time in which he can repay it.
- 22. Q. I have read an interesting paper by Mr. Tytler, who was formerly in the Opium Department, chowing how he was oble to get over 3,000 pakka masoary wells made in Seron. I should like to get your opinion as to whether it would be possible to overcome the projudice?—It is difficult to say, but it might be done with a good officer who had his heart in hie work.
- 23. Q. You don't think there is anything in the soil or want of manure, or any other condition that would add to the difficulties of the person who tried it ?—No.
  - 24. Q. The soil is fit for irrigation ?-Yes.
- 25. Q. And water is not too far below the surface ?—No; only 15 to 20 feet in years with good minfall and at the first time of the year.

WITNESS No. 22.—Mr. R. G. KILEY, Officiating Collector, Champaraa.

(Replies to printed questions.)

The chief obstacle to private irrigation is the want of control over the distribution of water.

Most of the hill streams north of the Sokrena nro ntilized for irrigation purposes, and each of these throughout their courses have connected with them a series of pains to carry off the water to neighbouring villages.

The water is obtained by damming the bed of the river.

These dame are ewept away by the rains and bave to be

The making of these dams is generally deferred nutil the last moment, in the hope that rain will fall and avert the necessity for making them.

When a serious break in the rain occurs, and irrigation becomes necessary to save the crops, bunds are at once constructed.

These streams carry an extremely limited supply of

The chancels made to carry off the water for irrigation are extremely defeative; in fact, sometimes water is allowed to flow off through natural depressions where there is no defined channel. The result is that a great deal of water is wasted. These persons who have broods high inp the stream get practically all the water, while these lower down get very little. down get very little.

When a serious break in the rains occurs, there are frequent complaints made to the Magistrate that ench and such a person has made a new band, or has made a bund at a place where it had aver been made before, and requesting that it may be out. Local enquiries in such cases are

necessary. The Magistrate cannot always get out at once to enquire. Frequently complaints of this sort como cimultaneously frem different places.

Delay inevitably follows with often disastrons resulte.

The jurisdiction of the Magistrate in each cases is extremely limited. He can only intervene to avert a breach of the penec, and his decision most he based on the ground of immediate possession.

He has not got the legal powers to cettle these disputes satisfactorily.

when it is found that any one person is appropriating to his own use the whole of the water of any particular stream, the order that is generally possed is that he must make a jhanj and allow holf the water to pass on. This is unsatisfactory, as obviously those who have hunds high up the stream get a great deal more water than those helow. A jhonj can be easily tampered with. Anyone can etop it at night with a few basketfuls of earth. Detection in each cases is very difficult, and it is situated in the locality of people who wish tostop it and far from those persons living lower down the stream who wish it to remain open.

The thanj systom is in overy way unsatisfectory. A

The jhanj systom is in overy way unsatisfectory. A better system is of fixing dates on which yillages along the conrse of any stream shall be allowed to take water from it. This is deed in the case of Manan pain which is under the cootrol of the Excentive Engineer. Government has a right to the central of the water of this pain as it was constructed as a famine work. It is almost impossible, however, to indeed natives to accept this eyetem in other streams, and at present it is impossible to compel them.

Mr. T. Barclay.

27 Oct. 02.

Mr. R. G. Kilby.

27 Oct. 1)2,

Ben.

Mr. R. G.

The only way to do this would be to bring these streams under the Irrigation Act. They would then he placed under the control of an officer legally competent to arrange for the distribution of water and to dispose of disputes summarily.

This officer would be an irrigation expert, and would be able to point out defects in existing irrigation works and to suggest remodies. He would be able olso to prevent the construction of new irrigation obtained on unscientific

He would presumably be an irrigation officer connected with the Tribeni and Dhako Canols and would be oble to see that new privote irrigation works, or extensions of private irrigation works were made on lines compatible with the construction or future development of Government Irrigation Works.

What then is required is that as many of the streams now used for irrigation should be brought under the Irrigation Act as is possible. That these should be placed under the control of a European Engineer connected with the Tribeni and Dhaka Canols und residing for the greater part of the year in the locality. of the year in the locality.

In order to assist the extension of private irrigation works, it is desirable that Government should be willing to leud skilled surveyors and scientific instruments to persona vishing to moke private irrigation works at a reasonable

To essist private persons in the construction of approved irrigation works by lending money at low interest.

- 1. Q. (The President.)—You are Officiating Collector of this district?—Yes.
- 2. Q. Hove you been long connected with this district ?- I have been in the Bettiah Sub-division for some time.
- 3. Q. I gather from what you say in your note that there is no irrigation in Champaran south of the Sakrana?-
- 4. Q. They look with suspicion upon it? -River irrigation would be acceptable if it were possible; well irrigation is not acceptable; there is a prejudice against wells in the native mind; they say it alters the texture of the soil.
- 5. Q. In a paper by Mr. Tytler I have seen it said that private people look upon river water as being cold and laving no fertilising power; they prefer a juil or well?—I
- 6. Q. I suppose you have not been here during uny time of drought or distress?—No.
- 7. Q. You say in your note "there was famine in Champaran in 1566, 1673-74 and 1896-97"; have you any statistics about the total number on relief works?—There are statistics, but I don't happen to have them.
- 8. Q. I wanted them rather as a gauge of the severity of famine. Are the people north of the Sakrana in the habit of irrigating from pains every year or merely in years drought ? - Every year there is a good deal of irrigation.
- 9. Q. You propose that the pains should be taken up and excavated and treated in a professional and scientific way P—
- 10. Q. Now would the people, who hencefit from the pains, zamindars or rayats, he willing to pay, supposing Government were to depute an engineer to direct operations?—I think thay would prefer to be allowed to do it themselves under advice. I don't think that where they have upain from which they have been getting water for nothing that they would like Government to make a now pain and charge for the water. for the water.
- 11. Q. Of course you will see that one cannot have improvements without paying for them?—Yes.

  12. Q. One of the first improvements would be to build sluices or some regulating works at the heads of the pains?—I think they would be too expensive. I did not contemplate that; I meant levels should be taken first.
- 13. Q. You have sent in a very interesting paper us regards legislation required for the regulation of pains. Would you bring the whole of the pains under the Irrigation Act?—I think I would bring os many as could be brought
- 14. Q. That would be all the more important ones !-Yes, merely under the control of some one.
- 15. Q. Would the owners not resent it in some cases: men who had been doing exactly as they liked with their pains hitherto? -Yes, they might.
- 10. Q. You would give the Magistrato power to levy a cess for necessary works?—Very slight.
- 17. Q. I am afraid several of the difficulties you alluded to here, us regards breaching of dams, etc., could not be rectified without introducing massnry works, but you have not contemplated what you say?—No.
- 18. Q. (Ser Thomas Higham.)-You suggest that mensness would be most useful in taking up land and excavating pains. Are there any tructs of that sort provided for it your femilier relief programme?—I have been only a mouth in office and have not seen the programme.

- 19. Q. Is there u programme?—Yes. (Mr. Scaly explained that pains would be carried out as civil agency
- 20. Q. You propose to bring all the systems in which there are pains under the Irrigation Act!—Yes.
- 21. Q. Is that possible? Could you bring them under the existing Act, or would you require a special Act?—Only so for as they were connected with one of the Government canals (Tribeni or Dhake).
- 22. Q. Is money ever advanced for making pains or works of that sort?-No, I don't think so; not to my knowledge.
- 23. Q. Under the Land Improvement Act?-One could do it.
- 24. Q. They don't take advantage of it?-No, I don't think so.
- 25. Q. (Mr. Muir-Mackenzie.)—You have only been Acting Collector a very short time?—Yes.
- 26. Q. Where were you before that ?-I was Sub-divi-sional Officer in Bettioh.
- 27. Q. Had you any power to give advances?—Yes, under the Collector.
- 23. Q. Were powers delegated to you?—Yes, only one year; I should have had to apply to the Collector.
  - 29. Q. You did not apply ?-No.
  - 30. Q. Why?-It did not occur to me.
- 31. Q. The practice of giving advances has not been much developed in the district?—They were given generally when there was searcity.
  - 32. Q. But not in ordinary years?-No.
- 33. Q. What is the reason? Is it because the people would not take them?—Because they were not apposed to be required.

Ø.

- 31. Q. The Land Improvement Act has been very little utilized P-I believe so.
- 35. Q. If money were given in large sums to competent people, do you think something could be done?—Yes.
  - 36. Q. You think people would take the money ?-Yes.
- 37. Q. Is there any chance of land-owners or cultiva-tors combining to take considerable sums of money for the purpose?—It is very difficult to get them to combine.
- 38. Q. I nm particularly struck with this paper of Mr. Tytler's. He says the way in which he got wells dag was by getting the smaller cultivators to combine. Would you despair of doing that here?—I ennnot say really.
- 39. Q. Supposing you devoted your whole time to it and nothing clee, could anything be done?—Yes, probably.
- 40. Q. Would the people spend the money properly ?don't know.
- 41. Q. If 'you think it could not be spent properly, don't you he sitte to say so? Perhaps you feel that the thing is so new that you cannot say?—Yes.
- 42. Q. You mention as one of the obstacles to the 92. Q. 10m mention as one of the obstacles to the extension of private irrigation works "the uncertainty as to whether the lease-holders will be allowed to hold the lands irrigated for a pariod sufficient to recoup them for the expenses incurred." What remedy would you suggest for that P—All the land belongs to the Bettiah Ruj and the length of lease rests with them.
- 43. Q. Have these people not occapancy rights ?—No the people who make these things are tenute-holders.

- 44. Q. And the period of their tenure is limited? --
- 45. Q. Have you any suggestions in regard to the second obstacle—that of channels ?—Unless Government can assist them with land, I don't see anything else.
- 46. Q. There is no difficulty in getting hold of the land? -Yes, there is that difficulty.
- 47. Q. Government has not any power under the existing Act to acquire the land P—Not unless it intends to make the canal itself.
- 48. Q. Should power be given to acquire land for private persons P—No.
  - 49. Q. This difficulty is very hard to solve P-Yes.
- 50. Q. You say that "well irrigation is very little practised in this district." Is there any reason why it should not be practised ?-There is a local prajudice.
- 51. Q. Is there anything in the prejudice?—It has not been tested to my knowledge,
- 52. Q. (Mr. Rajaratna Mudaliar.)—Yon said just new you did not think was desirable to legislate for acquiring land in the case of proprietors who wish to construct irrigation works ?-Yes.
- 53. Q. Why do you think it unnecessary?—If Government acquired land, it would have to make the channel itself, and having made the channel it would require the persons who used it to pay for water.
- 54. Q. There are cases in which private persons are prevented from constructing pains owing to their inchility to nequire land. Do you not think it would be advisable to legislato to enable Government to step in to acquire the land?
  —I don't think the matter is of sufficient importance to call for legislation.
- 55. Q. There may be a pain which, if constructed, might servo a dozen or more villages and a single man steps in and

- causes obstruction; in such a case would you not legislate? Mr. R. G. -I think legislation would cause more harm than good.
- 56. Q. But the Collector would exercise his own good sense in the matter ?—I think there would be difficulties.
- 57. Q. Mr. Sealy referred to a pain constructed as a famine relief work, under which there was a small eess levied for the repair of the pain; are you acquainted with that work?—No, I have never had anything to do with it.
- 58. Q. Do you think there is any objection to imposing a water-rate on lands irrigated by that pain?—I don't see the necessity for it. I know nothing of the way in which it is
- 59. Q. Government has spent a lerge sum of money in constructing it; why should it not recoup itself for the outlay by levying a water-rate?—It was made for the good of the country.
- 60. Q. Is there any reason to forego a water-rate and charge only three annas a bigha?—I den't know that there is any special reason.
- 61. Q. He said some raysts were prosecuted who took water without paying the cess; do you know if they were prosecuted under any special law or under the Indian Penal Code?—Under the Indian Penal Code sa far as I remember.
- 62. Q. Are there any cases within your knowledge in which loans were granted for the construction of wells?— I know they have been; they were not advanced by me.
- 63. Q. Does the law in these provinces allow Collectors to grant remissions in cases in which there has been failure of wells? Do you remit a loan when a well fails?—No; such case has never arisen.
- 64. Q. Does the law contain provision to that offect?-I don't know; no remission has nover been chimed.
- [Mr. Allen roplying to Mr. Rajamtua Mudaliar. The Collector would no doubt recommend a remission. I den't remember any distinct provision in the law.]

# WITNESS No. 23 .- MR. C. STILL, Manager, Bettinh Raj.

- 1. Q. (The President.)—You are Manager of the Bettiah Raj ?—Yes.
- 2. Q. Have you had long acquaintance with this part of
  - 3. Q. Have you seen augthing of femine?—One great mins—the 1896-1897 famine—was beavy in our part of famins—tl
  - 4. Q. Do you think the country is better off now than it was in 1825? Is there any change in the circumstances? -No. I thick oot.
  - 5. Q. Is there auything you would recommend in the way of rendering the tract secure against famine?—I think a great undsrtaking is the Tribeni Canal; outside that tract there would not be much; most of the pains would be taken in in connection with that seheme I think there would only be four miles more that remains to be talked about in the Masan pain for instance.
  - 6. Q. Do you think it is certain that the agricultural classes will take water every year ?—Yes.
  - 7. Q. And that they will not merely wait for a year of drought?—I think after one year of drought they will certainly take it up.
  - 8. Q. Do you approve of this idea that has been spoken of of taking the Tribeni noross the Sakrann?—I don't know if there are any engineering difficulties. There is a tract which, if it could he irrigated, would be the better.
  - 9. Q. (Mr. Muir-Mackenzie.)-The seil south of the Sakrana is not fit for irrigation?—There is a tract which would henefit, but all would not.
  - 10. Q. (The President.)-It is good coough for cultivation?-Yes.
  - 11. Q. It has dry soil ?- Yes, I doubt if it would held meisturs; you would always have to irrigate.
  - 12. Q. You have had a good deal to do with pains ?--
  - 13. Q. Do you consider that the irrigation carried on by these pains is in a satisfactory condition, or could anything be done to improve them?—I think that I would leave that to private enterprise, assisted by Government. There might be an enquiry as to the coudition of these pains, and where it was found necessary to take them over by Government, that should be done, and lot the Tribeni Caual tako over tho halance.

- 14. Q. Where they are not working satisfactorily?—There are places where there would be disputes between the different people; in these circumstances I would give the Collector a little mere power to settle the matter; 27 Oct. 02. but would not allow any further interference with them.
- 15. Q. If there was a real improvement to be introduced into a pain, it would of course cost monsy; would the zamindars or raysts resent a cess being laid on their lands on this account?—I think the people who had been enjoying the proceeds of their own labour for the past 20 year would resent it. They would pay for extra improvements.
- 16. Q. Supposing it was a sluice at the head or a regulating wair ?—Woirs are very agreement. lating weir P.—Woirs are very expansive and could not be very well introduced; simply putting in head-works would not help much except to eatch a little silt.
- 17 Q. Is the Tribeni looked upon as a great boon?—Yes, I think so; the people understand irrigation and have done as much as they possibly can and wherever they can.
- 18. Q. (Sir Thomas Higham)—You think the best thing would be to help the owners of pains with advice P—Yes, after due enquiry In certain easos where disputes arise perhaps it would be better for Government to take them
- 19. Q. Would the preprietors not welcoms that ?not necessary in our part of the world; when the Iribeni Canal is completed it will take over the greater part of Champaran; that is snitable for irrigation.
- 20. Q. Would they take advances ?-I think they would for improvements.
- 21. Q. There are many on the same stream. Could there not be no amalgamation at the lower end !-- I think that might be done in certain cases.
- 22. Q. Would the people he willing to work it up and earry it out?—I don't think I should put much faith in the people. I should leave the tikadars to deal with the people themselves.
- 23. Q. Would the mineral people, do you think, combine to earry out any rational work?—Yes.
- 24. Q. Is it only want of money that would prevent them, or are there jeneusies ?—In Champaran there is one landlord and that facilitates matters very much; that is the Bettinh Raj; there is no object in acquiring hand; there the Raj would only too gladly give land free for the

Kilby. 27 Oct. 02.

Still.

Mr. C. Still. 27 Oct. 02. improvement of the estate. In other estates I cannot say whether the owners are sufficiently interested. The Ramnugger Raj to the north will to a great extent he taken in by the Tribeni Canal. Any hill streams to the north of the Tribeni Canal might be enquired into us to whether worth developing for irrigation or not.

- 26. Q. Do you spend a largu sum on improvements ?-
- 26. Q. Not us much as there might be?—As much as we could afford perhaps.
- 27. Q. Would you advocate that extension south of the Sakranu?—Yes, provided there ere no engineering difficulties.
  - 28. Q. You would have to cross the river !-- Yes.
  - 20. Q. Would not that he very costly ?-Yes.
- 80. Q. And it is a question whether you could get sufficient water P—Yes, that is the great question; that partioular tractof country is the same as ut the north, i.e., clay soil.
- 31. Q. Can you say anything of these other projects to the west, the Tiluri and Passulf-No, I don't know the country very well.
- 32. Q. Ito you know the extent to which the Nepsleso interfere with the streams f—The hill streams we have to deal with don't come from Napal; the water-shed is on our side.
- 33. Q. (Mr. Mair-Mackenzie.)—Have you uny suggestions at all to make to the Commission?—No.
- 34. Q. (Mr. Rajaratna Mudaliar.)—If more funds were available, more might be done in improving irrigation in the zamindari?—Yes.
- 35. Q. Why don't proprietors take loaus from Government?—I fency it would be better to deal with our tikadarse; they are responsible gentlemen as a rule.
  - 36. Q. They might apply to Government?-Yes.
- 37. Q. Do you think the terms on which loans are officed are sufficiently liberal: 61 per cent. for 20 years ?—I think so; decidedly liberal.
- 38. Q. You don't think a reduction in the rate of interest or extension of period is necessary?—No.
- 39. Q. Still very few proprietors take loans from Government; what is that due to ?—I don't know.

- 40. Q. Is the black system maintained in your zamin dari ?-- No, the nakdi.
- 41. Q. Hue the zamindar power to enhance the rent where they construct irrigation works?—They have thu right to enhance rente if they construct works at their own cost; but it is not done.
- 42. Q. Have any irrigation works been constructed in the past 20 years in the zaminduri ?—Yss.
- 43. Q. Huve new works been constructed?—There is nothing very much. Mr. Moore ned Mr. Brocke mude pains and of course Mr. Coffin.
  - 44. Q. There was no unhancement of rout?-No.
- 45. Q. Is that due to any difficulty in the way of enhancement or to generosity ou the part of the proprietor?

  —They take their return in that they seeme the crops.
- 40. Q. Supposing the Triboni Caual wers extended to the zamindari, would the people be willing to pay water-rates?

  —Yes, after they had had sufficient experience of the value.
- 47. Q. (Mr. Muir-Mackenzie.)—You are of apicion that when the Tribeni Canal is made the district will be sufficiently protected from famins?—It would certainly protect the whole of the north of the district which is the part that suffers.
- 48. Q. De you think it would be protected so for that relief would be unnecessary?—I think oo.
- 49. Q. (Mr. Allen.)—Why is well water unpopular in Saran?—South of the Sakraou they object to thom.
- 50. Q. Have you made enquiries us to the cause?—I have made hundreds of wells at different times in the famine year. I experimented and found them very unsatisfactory. The amount they do for you is nothing. Tuo Opium Department is particularly interested in this. Immediately round villages villagers can irrigate their opium and their rice seed, which is very important. Where land is sultable, wells do for opium, as opium only requires surface irrigation and for rice seed for same ocasoos and that the regulated land is very small in area.
- 51. Q. Huve you heard anything ubent the use of well water in Champarau?—High lands don't take water us well as in the low lands as salts form. In the north of the Sakrann there would be no difficulty so fur us calts go.
- 52. Q. You have known that yourself?-Yes, in Saran too.

WITKESS No. 21.-ME. S. E. COFFIE, Zamindar, Sati-Bettiah, Champarau.

Mr. S E. Coffin. 27 Oct. 02.

- 1. Q. (The President.)—Have you long acquaintance with this district !— Yes.
  - 2. Q. Have you seen fumine in it ?-Yes.

3. Q. Wers you here in 1873-74?-I was not to Champaran.

- 4. Q. What measures would you recommend for rendering the district more secure from famine in the event of another failure of the rains?—North of the Sakrana the Tribeni Canal would do all that is required.
- 5. Q. Is there water enough in it for the whole district?—I understand there is.
- 6. Q. Is there water enough in the Tribeni Conal for all the land could be commanded f
  - (Mr. Horn.)-There are 2,170 cubic feet.
- 7. Q. Is that all that is likely to be required to meet the wanto of the place  ${\bf P}$

(Mr. Horn.)-I think so.

- E. Q. I mean if there was twice os much water would the canul he mude twice as large?
- (Mr. Hern.)—We have not contemplated these ex-
  - 9. Q. You have, I suppose, largely used pains?-Yes.
- 10. Q. And do the people use them in years of drought P.—Yes, overy year.
- 11. Q. From what you know of the country would it be desirable, do you think, to take these canals further than at present?—I ecrtainly think it would if there is enough water.
- 12. Q. Do you find things work fairly smoothly os regards irrigation from the pains?—Yes; I have had same diametes.
- disputes.
  13. Q. Are the rights of the different villages fully recognized as regards the amount of water they take? I

- precume the people at the top of the river can furn off the unpply from those lower down?—I have entire coursel an 't allow it.
- 14. Q. And as regards others, what have you found?—In the case of vilings where there are different fikadars at eve are disputes; very often they allow the water to go wasto rather than let it go down.
- 15. Q. Would the sitentien be improved and the water be better utilized if there were legislation f—As far as I know where this Tilbenl Canal is there will be no necessity for these small pains to the north of it.
- 10. Q. But you must come to the end of the Tribeni; how about the east? The Tribeni will be exhausted before you get to the end of Champuran?—I cannot speak of that part of the country; I am only talking of the part that the Tribeni flows through.
- 17. Q. What is your opinion about well irrigation? Has it any place in agriculture?—There is hurdly any well irrigation.
- 18. Q. Have you any practical knowledge of the land south of the Sakranss'-No.
  - 19. Q. The land north is all rice land !-Mostly.
- 20. Q. Do you think that that district ut least will be pretty safe once the Tribeni is in working order?—I think
- 21. Q. (Sir Thomas Higham.)—You have a good muny pains over your estate?—Yes, about 50 miles of pains.
- 22. Q. How many separate pains?—There are two main pains—one from the Pantai and the other from Muniari; the others are off-shoots.
- 33. Q. Do you require bunds at the heads of these? have to bund the river, in the first instance, to get water I usulu hund up the rains to rains the level of the water to fined the loud I want to irrigate.

Mr. S. E. Coffin.

- 21. Q. I suppose the brads you put in the river get washed away ?—Yes; it is very difficult to keep them in the rains, onless it is a very dry year.
- 25. Q. What is the depth of the river?—The Pantal is 150 feet.
  - 26. Q. Have you ever raised the question of putting up a permanent bund?—Yes.
  - 27. Q. There are no folling shutters?—No; it was thought too expensive; a kachcha hand costs very little, so it does not much matter even if it is washed away.
  - 28. Q. What is the arm you irrigate from these pains?— In a famine year I irrigate about 12,000 acres.
  - 29. Q. And in an ordinory year?—Anything between 4,000 or 5,000 acres.
  - 30. Q. I suppose the amount they will irrigate from the Tribeni Canal will not be more than \( \frac{1}{2} \) of what they will irrigate in a femine year?—In time they will take water every yesr.
- 31. Q. Do you make bunds every year?—I don't trouble about bunds in an ordinary year.
  - 32. Q. You only make bunds when there is great demand for water?—Yes, I give water for opinm and rabi every year.
    - 33. Q. Do you give them water for rice ?- Yes.
  - 31. Q. In ordinary years?—Yes; sometimes the hand stands.
  - 35. Q. When does the bund break?—It dopends on the rain in the hills: semetimes on the let of July, sometimes in Juoc.
  - 36. Q. They only get water for seedlings?—Yes, they put down seedlings early.

- . S7. Q. Are they all your tenants?-Mostly.
- 38. Q. Do you charge them anything for it?—No. I give it free.
- gove it tree.

  S9. Q. You get benefit from the predneo?—If they get n good crop, it enables me to got the rents in.
- 40. Q. Do you take your reuts in a share of the crop?—No, in each. I irrigate all my indige and other crops.
- 41. Q. When do you want water for indigo ?-I don't sow till the end of February.
- 42. Q. Do ontsiders pay for the water you give them ?—
- · 43. Q. Have you ony idea what they would be willing to poy for it?—I think they would pay me Re. 2 to Rs. 3 an acro. In a dry year they would pay me anything for it.
- 44. Q. In an ordinary year what is the difference between an irrigated and unirrigated crop of rice?—It would make a difference of 25 per cent in the value of the erop; in the case of rabi it doubles the value.
- 45. Q. How many waterings are required in the rabi?— Two to three.
- 46. Q. (Mr. Rajaratna Mudaliar.)—As regards the protection of these bunds, who orranges it, is it arranged by the zamindars?—Yes, with the help of the rayats; the day the river is to be bunded up they come in and give one day's help.
- 47. Q. What area is irrigated under these pains?—About 20 to 25 square miles.
- 48. Q. (Mr. Muir-Mackenzie.)—Would you be willing to take advances from Government? Would they help you?—I could not do anything more then I have done. I have got all my pains made.

WITMESS No. 25 .- Mr. E. F. GROWSE, Officiating Additional Commissioner of Patna, late Collector of Saran.

Note on Irrigation in Saran.

1. I bog to submit for the Commission's consideration a letter from Mr. Graham, the Officiating Collector of Saran, to the address of the Commissioner, and dated 21st instant, which puts the case from the local point of view.

I would wish however to add the following remarks:-

- 2. The Saran Connis are not and con never he made a productive work. The conditions of rainfall and of the district generally prevent this. But they should be regarded as a protective work in years of seanty rainfall, and as a conitary work also, and with this latter object in view, should be maintained open all the year round, in all years.
- 3. They should be, if possible, improved. It appears from Mr. Hern's note that the initial difficulty is the uncertainty of the emply of water in the seas or byechannels of the Gandak from which the canals or rather canalized rivers are fed. He also says that there is a great danger of these channels being left dry owing to changes in the coorse of the Gandak.

This is of course a question for the engineers; but it would seem that improvement of the source of apply is not impossible, and at any rate even under existing conditions at certain seasons of the year an almost unlimited supply of water can be led into the canals, and perhaps this could be held up and regulated instead of being allowed to flow out at the other end into the Ghagra or Gouges.

For this purpose weirs or regulators will be necessary at intervals.

Siniees will also be necessary at the many existing outlets from the canels, and facilities should be offered to private individuals to construct channels, and, if required, to acquire land for the purpose, to act as distributaries.

- 4. It is not improbable that this scheme would be more feasible on the two western counts—the Daha and Gandakl—for the supply of which water seems more readily available than in the case of the Dhanai and Ghangri; and it would enhonce the valoe of the scheme if the Jharahi river, which lies still further west of the Daha, could be connected with the Gondak in the same way as the Daha and similarly treated. The Jharahi is at present a singuish stream from which irrigotion is practically impossible owing to its steep banks, and the neighbourhood of which is particularly unheelthy and malarious. It runs for nearly 20 miles of its centred in Sarah through the Hatwa Raj, but leaves the Gandak at a point in the Gorskhurg district
- leaves the Gandok at a point in the Gorakhpur district.

  5. If the canal system is improved and extended the next important point is the question of recompment of cost

- to Government. I do not think it wise or equitable to attempt to recover the 7 lakhs already expended. The benefits have been barely sufficient. Neither would I attempt in any case to recover by means of a water-rale, because in many years no water would be taken, and also because of the great difficulty in measuring up and assessing the water taken for watering rice, which experience abows would often be benefited by irrigation in September and October when the hathiya rains fuil.
- G. I also consider that it would be difficult to levy a cess on the awners or occupiors of the land benefited only. It would perhaps be possible to define the aren protected, and levy a cess on all lands within this area; but the definition would lead to codless objections on the part of those whose lands were on the boundary, and increase the Collector's difficulties considerably. It would also be unpopular, and, although perhaps strictly equitable, would seem invidions. It would also require legislation.
- 7. The embankment coss levied from all estates in the Saran district for the maintenance of the Gandak embankment, although all estates are not equally benefited or protected and many are not protected at all, affords a precedent for a general coss such as I would advocate. I would in fact regard the embankment and canals as one system. It is the construction of the embankment, that by closing the mouths of the drainage channels, has rendered the canals a necessity, and the lutter are direct resolt from the former. Such being the case, I would increase the embankment cess by a sam sufficient to pay a small percentage on capital outlay, and to cover working expenses. Even if nothing more were done to the conals I would recommend this, but presume to urge that their extension and improvement is essential out the lines roughly indicated in the estlier part of this note.
- 8. I may add that the improvement and extension of the existing canal system is necessary, in order to permit of the execution of the various small schemes—some of which have been referred to in Mr. Simkins' note—for opening out for both irrigation and drainage purposes the many old drainage channels in the district as protective works.
- 9. It is unfortunate that a fresh contract for 20 years has recently been completed with the zemindars to pay embankment cess. But it would be possible to ascertain whether, if the improvements and extensions are made, they would object to a revision of the contract before the expiration of its term, and if not work could be started. The advantage of adding the canal cess to the embankment

Mr. E. F. Growse. 27 Oct. 02.

Growse. 27 Oct. 62.

cess would be that no legislation would be required, such as would be necessary if a separate canal cess

would be necessary if a separate canal cess were imposed.

10. The question of centrol arises. If things are left in statu gno, it would probably be best to hand ever control to the District Beard, which is a representative bedy. But in that case it would be extremely hard to throw upon the District Beard the burden at providing out of its existing revenue the cost of maintenance. It would be hardly fair for Government to get rid of its responsibility in this way by transferring the charge from Provincial to Local revenue. At the sume time it would not be advisable or very useful to give the District Board power to sell the water. This would lead to endless difficulties, and would of course merely mean that in the end the Collectar would have to assess and callect the rate. Perhaps some arrangement might be made by which the Pravincial Government and the District Beard should share the cost of maintenance, the latter supplying the the Privincial Government and the District Board should share the cost of muintenance, the latter supplying the central, until the next revision of the contract for the embankment cess, when the cost of maintenance of the canols should be added to the cost of the maintenance of the embankment, and collected by Government—as much of the praceeds as represent the former being headed over annually by Government to the Beard.

annually by Government to the Beard.

11. But if the sistem be improved and extended at the cost of considerable additional capital antlay, I me doubtful whether a local body like the District Beard could be well entrusted with the duty of control. It might be too big an ondertaking and might necessitate a special stuff so large as to require too much of the District Engineer's attention and swamp other work. At the since time I do not feel disposed to give up the idea entirely. It will be necessary to wuit and see what the Beard's responsibilities will be.

It would seem that although section 53, clause 8 (1) of the Local Self-Government Act forbids the construction of any channel from District Board funds for the purposes of irrigation, there would perhaps be no legal objection—after due notification by the Lacotenant-Governor—to make over the council of such channels for sanitary purposes under section 88 of the Act. The fact that they would be used for irrigation could not affect the question as long as Government is content to give over its right to control.

Of course in this case the proceeds of that portion of the embankment cess which represents the additional cess for causis must, less cost of callection, he made over to

Copy of Mr. Graham's letter dated 19th October 1909, to the Commissioner.

With reference to your memurandnin No. 5101 G, dated 17th October 1902, forwarding Government of Beogal's letter No. 21 T. R., I have the monour to submit below the names of three gentlemen whom I have selected to appear as witnesses before the Irrigation Commission on the 23rd und 24th October :

Mr. J. D. Macgregor, Arrowah Concern. Mr. M. Mackenzio, Burliega Concern. Mr. G. Penn Sunkins, District Engineer, Saran.

Mesers, Macgregor and Mackenzie are Indigo Planters of experience and will be able to give evidence from the point of view of the planting community, while Mr. Simkins is thoroughly acquainted with the district and will be able to represent inatters from the point of view of the District Brard as well as from an engineering or professional course of view of sional point of view.

- 2. I am also forwarding a short note by Mr. Simkins dealing with certain irrigation projects for this district which are under consideration.
- 3. It is a matter for rogret that Saran was not included 8. It is a matter for regret that Saran was not included in the tour programme of the Irrigation Countle-iun since both its din-ity of population as nell in its circumstances of soil and climate indentically entitle it to consideration. I trest, however, that the Commission while it Bankipur will be able to devote a little of its time to the discussion of irrigation projects for this district and will place on record noy conclusions which may be arrived at. I have purposely restricted the number of witnesses selected by me to three though more could easily have been obtained because I see it is anticipated that not more then four witnesses will be examined in a day. witnesses will be examined in a day.
- 4. The history of Samn uffords a very excellent illustration of the danger of meddling with nature. Some time

in the last contary (the first mention of it is on records of the year 1790) what is known as the Sarau embankment was boilt in order to save the district from floods, and this was boilt in order to save the district from floods, and this object no doabt was accomplished, but nt a cost which would certainly have caused its promoters to hesitate could they have foreseen the results. For though the oxclusion of the Gaudak water doubtless prevented the recurrence of floods it caused an entire change in the drainage of the enuntry the effects of which are still distinctly visible. For whereas formerly the Duhe, Dharai and other water tourses were fair-sized rivers pourling a large volume of pure fresh water through the district and navigable some of them for large boints all the year round they are now only sluggish stienms, and in fact during the greater part of the year are a mere series of staguant unlarious pools the neighbourhood of which is so notoriously unhealthy that peeple do not like to live near them. In short the crection of the embaukmunt effected what was in reality merely an exchange of evils. It secured the district from errection of the embaukment effected what was in reality merely an exchange of order. It secured the district from danger of fluods, but rendered it liable to a still greater evil, viz., draught. There can be no doubt that the character of the district was to u great extent altered by the oreestion of the ombankment and as time went on and this was more and more realised Irrigation projects on a large scale were brought forward. These prajects by strange irony of fats seek to restore by artificial ascans what was the natural state of things money years previously, i.e., before the er-ction of the Gandak embankment. They do not however step there. They seek something more. For while they seek to bring the water of the Gandak into the district they aim at doing so in such a way as to effectually irrigate the whole district while incurring no risk of inundation. In other words what is wanted in Saran is a well regulated supply of water which will secure the district ngainst fear of drought without rendering it liable to flood.

5. As regards supply of water Simm is particularly

flood.

6. As regards supply of water Simi is particularly favorably situated since the Gandak at certain times of the year is capable of furnishing an illimitable supply, and all that is required a to regulate and distribute it. I propose to consider very briefly how far attempts to regulate and distribute it have succeeded in the past. But before dulag this I must say a word or two as to the need for irrigation. As regards this there can, I think, be no two opinions; the annual mainfall of the district is a very short one, riz., 40 89 luches only, and experience shows that it has a tendency in fail periodically with a mealthing wide-sprond in partial failure of roops. There were faminate in this district in 1806, 1874 and 1890 and partial failure of crops is a by no means necommon thing. Judigo, rice, tins distinct in 1800, 1874 and 1870 and pritist infinite of orops is a by no means nucommon thing. Indigo, rice, maize and other crops fequire a constant supply of water, especially rice, white the rabi crop, most important of all, needs a sufficient amount of moisture in the soil in order to be a success. If a properly regulated supply of water could be ensured failure of crops would be an unknown

ندمة

thing.
6. Unfortunately the history of the Saran canals has been a history of misurar agement and sailure. The iden of the Gandak which had belting into the district the water of the Gand & which had proviously been excluded with soch care seems to have first urbsen in the seventies, by which thee no doubt long experience had shown conclusively that the Saran embankment had not proved such an numbered blessing as was originally satisfacted. In 1876 two planters of this district, Mesers. D. Reid and F. Murray, began to again for a canal scheme io order to sayo the craps and it was ultimately decided after a good deal of discussion to adopt a scheme consisting of the following works: the following works :-

Head cut with shince at its head from Sissua to Bijarpur, 61 miles in length.

Feeder channels from the Enpau-Chap-Sota to the following new sluices :-

1. Dalia. 3. Dharai. 1. Daha. 2. Gandaki. 4. Gungri.

These works were rarried into execution on a guarantee The administration and working of these rainals lowever was a failure from the commencement and thu chief couclosions arrived at may be stated as fallows :-

(1) That the agreement between Government and the guaranters needed revision as the condition that "the guarantee should be paid if water is supplied in the casels in all the moeths of the year is almost an impossible our to carry out 'ou my system of canals, and specially on the Saran Canals."

(2) That it would be nurise to spend more money on the canals as the source of supply is not to be depended on.

- (3) That an unpaid administrative staff is n failure and cannot be relied on. When a new agreement is enfored into provision should be made for a proper staff to prevent surreptitions banding of cannals. Collections should be made if possible by the Collector.
- (4) That the schome is imperfect, though it bonefits the guaranters and is worth more to them than the sum senually paid by thom, i.e., Rs 21,750.
- (5) That Government is a lover to the extent of about Rs. 30,000 numally and the grammate should be increased by that amount or other errangements made to cover the loss.
- 7. The above conclasions are taken bodily by me from a report on the Saran canals by G. W. Faulkner, Esq., C. E., written in the year 1885, and there is no dealt whatever that representing as they do the results of octual experience they would be of great value if the question of irrigation were seriously taken up again. It is to be remembered however that the position has very much changed since that time, and that the Indigo industry which was then fleurishing and able without dithoutly to guarantee a word bed state nod would certainly not be prepared to guarantee even link of that same.
- 8. Under existing conditions n guarantee would hardly be feasible and the best plan new would probably be to pay far irrigation works by means of a small canal cess. A proor two in the rupec would be sufficient and the tax would not be an emprephilar one since it would confer a benefit which would be appreciated by all classes.
- which would be appreciated by all classes.

  9. The second conclusion mentioned above, viz., that "it would be unwise to spend more money on the casals, as the senice of supply is not to be depended" has hardly been borne out by experience. Experience shows that if the causle are opened at the proper time, i.e., during the rains and before the water in the sola has fallen too low any quantity of water can be obtained and the cost of bringing it into the district is insignificant. But, and this is the most important point of all, it is no use being satisfied with incredy bringing the water late the district. There must be a system of proper regolators at every four or five miles in each of the causlised rivers and a system of channels for distributing the water. Otherwise it merely comes in at une end of the district and goes out at the other and accomplishes very little good.
- 10. Of late years there has been no systematic working of the cacals at all, but it has been the custom to apply to Government to open thom whenever the prospects of the crops appear to be in doubt. This too is a direction in which reform is required for the direct central of the canals rests with the Fublic Works Department which rightly or wrongly has gained a repatation for obstruction. The funlt however has not so much with the Public Works Department as with the system which makes the cost of working the osaals debitable to the Public Works Department while it provides no special fund for the purpose. This is the secret of the Opposition which has been met with in recent yous for the Public Works authorities.
- 11. Then touit has been a general subject of complaint that when the canals are opened they are mismaleged. Water is not let down then in sufficient quentities and just when it is most wanted there is none available because cross bunds have to be created in the sota and the Public Works Department refuse to make them until the cost is goaranteed.
- 12. There can be no doubt that the teaching of experisace is clear on two points, viz.—
  - (1) The cost of opening the canals should not be debitable to Public Works Department funds. The money should be provided in some other way and should always be available in case of emergency.
  - (2) The notual control as distinguished from the charge of the conals should rest not with the Public Works Department, i.e., with some high official in a hill station many miles from the place itself but with the district authorities who are on the spot and are in a position to know exactly where irrigation is required. Prompt action is everything and the present system has been found to be anything but prompt.
- 13. The chief arguments to be urged in favour of improving the Saran Canals are as follows:—
  - (1) Insurance against drought and consequent failure of crops.

- (2) From a sanitary point of visw the flewing of a Mr. E. F. volume of pure fresh water through the various streams in the district is an excellent thing. It seems them oot, provides good drinking water for the people, and renders the banks of the rivers habitable with suffity to health which they certainly are not now.
- (8) Thirdly, it is a recognised fact that the opening of the canals has the effect of raising the spring level throughout the district, which gives the moistore in the roil so necessary for the rabi crop. It, at the same time, raises the level of all the wells—in itself a very great hence indeed.
- 14. I think there can be no doubt that the opening of the canals oven as they have been warked this year is a great boon. From one or more of the points of view above mentioned, and oven if neere elaborats irrigation projects are found to be impracticable I think that it would be a good thing if the canuls were opened as a matter of course overy year at the season when it can be done with least expense. There is nothing at all to be lost by opening them, and on the other hand there is much to gain. The cost is trifling, if done at the proper time and might conveniently be met by the District Board who could provide for it annually in their Budget being recompensed in return by being vested with the central of the canals. This would certainly be a more satisfactory arrangement than the present one.

#### Copy of Mr. G. Penn Simkins' letter dated 9th October 1902, to the Oollector.

With reference to Commissioner's No. 5176, dated 26th September 1902, I beg to hand you herewith a note on Irrigation works in our Famino Rellef Programmo. The particulars of the surveys of two projects, referred to, I will send you as early as possible.

#### Irrigation Projects.

The bulk of the so-called Irrigation projects in the Famine Relief Programme for the district consist of small works anch as cleaning out and re-aligning existing cuts and pains taking off from the local rivers and leading to and from chains; these cannot be looked upon as Irrigation works except in a very small way. Real Irrigation works are such as will, after construction, either materially improve a certain nrea of country or act as reliable preventatives of famine ar seriety, in the event of a failure of rainfall, etc. Of such works there are only three in our present pragramme, viz., eacal from Mahair Chaur to the Hardia Chaur, channel from Ambicapur to Daraunds, via Barharria (30 miles in longth), channel from Gandaki to Awasta (25 miles long). Of none of these have we, at the time of writing, any actual working particular. A has, I am given to understand, been surveyed through the agency of the Public Warks Department and a report is under consideration. B, Mr. Hatchins of Tagapor, the proposer of the works, gives some interesting details in his letter of 14th July 1902 and a reconnaissance survey is in hand. C, we have no data, but I have put lu hand a reconnaissance and will be able to give some information on both surveys in a week or so. Other works which might, with great advantage, be entered in the Dietrict Programme of Rolief Warks are (1) canal from Nugra to Chupralı, (2) canal from Chiránd to Gurkha. No. (1) is a work which would be of great benefit and by no means difficult of cenetraction. There is, at present, a sluice on the Gogra at Chupralı and all that is required ie a weir under the Roail Bridge ut Nagra and a sluice to control the water in the Gandaki, where this canal excavated the supply of water to the chaurs to the north of Chupralı would be assured; this yem owing to the latences of the rains, these chaurs are only about half oultivated; had a canal existed, water from the Gogra could have easily been passed on to them and so have serared a full crop. No. (2) would also be n most

As mentioned above, the other Famine Relief Irrigation works are the clearing unt and re-aligning of small drainage and other clumnels; these all depend for their usofulness an the actual working espacities of the various cannilized streams in the district, and I am afraid till some practical system of rendering these streams more useful than they

Mr. E. F. Growse.

27 Oct. 02.

are at present, is adopted, the usefulness of the small auhsidiary channels will be mil. The opening of the Saran Canals may do good to a certain limited area of country, nlong the upper reaches of the canalized rivers, but the benefit to the district as a whole, obtainable from them us worked at present, ie very restricted; where due armagements made for the conservation of the water, which is let down the local rivers, then the utility of those channels and pains would be great, but as matters stand they are of very little practical value. Except perhaps as works giving

occupation to a certain number of workers in times of searcity, which really ought not to oxist. A very good example of what can be done is seen at Dhangaraha on the hiver Dhana, where woir was put in some verre age by private enterprise, the existence of which has supplied the means of prigation to a tract of country extending nearly 5 miles long on both hanks of the stream; what has been done at Dhangarobn could, I believe, he doce at other places on the vorious rivers, with equal advantage.

- 1. Q. (The President.)—How long have you heen in this part of the country?—Two years and four months. As Collector of Saran, until July 1st of the current year.
- 2. Q. Havo you had pravious experience of this part?-Not of North Bihar.
- 3. Q. I say that the whole district is shown as liable to famine?—That is in the "famine programme" submitted to Government, but I would modify that by saying that the whole district is liable to scarcity and distress, and that some ports of it are liable to severe scarcity and femine. It is difficult to define which parts. The phrase quoted is an over-statement.
- 4. Q. Whot do you consider the hest measure to take for this district to minimize famine?—The hest, I can think of, is to improve the existing system of the Saran Canals, by which we can get a larger supply of weter down the canals, and, when we have get it, to regulate it.
- 5. Q. These Saran Canule are closed altogether now?— Practically. They were opened this year during the last cold weather ufter pressure had been put on by the local authorities.
- 6. Q. What irrigation are they calculated to dof —They are sold to be uhls to do about 64,000 acres, but the most ever done was in the year 1884-85, when they did about 21,000 acres. Perhape they could do ahout 6,000 or 7,000 more. The difficulty was with the working of the canals. That water was not received when it was wanted. It was the complaint of the local planters. The canals were constructed after the famine of 1873-74, and they were opened on a guarantee given by certoin indigo planters. Money was received from Government direct and from the plantors, and they recovered from the rayuts who used the woter, and they also used the water for filling their tanks, etc. But it was an nusatisfactory errangement to everyhody.
- 7. Q. The theoretical maximum might run up to 64,000 acres?—That has been stated. We have 72,586 acres of well irrigation. The former figure is taken from the survey, but the latter is made by merely multiplying the number of wells by a certain figure, and I doubt if it he correct. They have multiplied by four. There are 27,000 and mosoury wells and 3,000 add kacheka wells.
- 8. Q. That is not an extravagent calculation for the agreege of wells?—I doubt whether they do quite so much. I think three acres each would he a fair estimate.
- 9. Q. How do you recommend that the Saran Cauale should he administered in the future? Should Government take it over at once as an imperial work?—No, it is far too amell u thing. It would be hetter if it could he improved and ufterwards handed over to the District Board to work. I do not imogino the water would be taken every doy for irrigation. Saran is u big wedge hetween the Gogra and the Gaudok, and the Saran emhankment runs along the south or right hank of the Goudok and was constructed a good deal more than a hundred years ago and was token over by the Government at the end of the eightcenth century. It was constructed to protect the whole district from flood; in eo doing it closes the mouthe of the spill channels which come scross the district from the nerthwest to the south-east. They take their rise in the Gaudok mostly. By closing these spill channels, noturally the water received by these channels which are small rivers has heen very much roduced, und whereas there was deep water io most of them and novigotion, practically no hoats con go along them now. In many years we do not want irrigation from these rivere; hut when we have a yeer of drooght, every drop of woter in the district is ntilieed and the cultivators are very olever in ntilising water in every possible way; and now that the obannele which form the eo-called canuls are closed, it looks like a ein that the water cennet be got down when we want it.
- 10. Q. How do you get the water from the rivers on to the lond ?—By lift; there is no flow.

- 11. Q. If these conals were improved, they might he really a source of value to the district?—Distractly.
- 12. Q. What do you propose? That a Government officer, an engineer, should be sent to thresh out what can be done and to prepars a scheme which Government should carry out and make over to the District Board?—Auother idea has been suggested that the District Board should be given the power to construct the works.
- 13. Q. With what money?—Borrowed from Government. But I am not personally in fuvour of that.
- 14. Q. I suppose it is possible that if it were done, the works might be on a lurger scals and more irrigation done?

  —Yee. But we should not want much larger irrigation except in a few yeors. Another bouefit, which would arise, would be the raising the level of the water in the wells oll along this tract. It is a known fact that when the counls were opened regularly, even with the flow of water that they then gave, the well level was raised four or five feet in usighhourhood, and that is a very great consideration. Secondly, there is the sanitary consideration. At present these channels run quile dry after the rains, and they become mersly a series of molorious pools, and if we can hold the water op by small wors in places, we can henciit the district from a canitary point of view. The banks are uctoriously unheelthy. The river Jharabi chould also formpart of the ocheme.
- 15. Q. At present there are really four schemes independent of each other?—It is one scheme. They all come from one river.
- 16. Q. But the making of one does not imply the making of another. They each etand on their own bosis?—Yes, but with all four it would be very much better.
- 17. Q. Why were they closed?—Because of the difficulty of finding momy to keep them open. Government insisted that before they were opened a certain guarantee should be given and subsequently certain other rules were derised by which on individual wishing to have them open must put down a certain eam of money. No one will come forward and do that now. The indigo industry is not flourishing now, and the only people with suterprise are the planters; the zamindars would not combine for that. The Hutwa Raj which owns most of the northern part would, but they would work it entirely for their own henefit; it would not be a public thing. The cost of constructing and maintaining these canals has fallen and will fall on Government, and noturally Government requires to secure this money, and thus the question of recouping this money arises at once.

7.E.

- 18. Q. Would the cultivators of that tract be willing to accept a cess P.—Not the cultivators; they would pay, prohably, if it were ordered, but I would propose a cess on the comindar.
- 19. Q. They might kick agoinst it?—If it were not a very large one, there would he no great opposition especially if they were to recover half of it from the rayat us with the nond cess. Or, looking at it as port of one scheme with the emboukment on the ground that hut for the omhaukment the canals would not be necessary, and thue regarding the embaukment and canals as one protective system, there might be one cess. That is to say, that a small water cess might be odded to embaukment cess and levied on each estate in the district, whother actually protected or not by the cenals. The cess hos already been levied in this form by contract eince 1881 when Sir Antony MacDonnell was Collector of Saran. It is about Rs. 23,000 a year only on the whole district.
- 20. Q. To corry this out it would he, I suppose, a case of a tolerably severe cess until the work was done, and then a light cess for maintenance afterwards, or are you prepared to borrow money from the Government to epread it over more years?—Counct Government he content with interest? We could have a cess to cover Government interest and cost of maintenance perhaps.

Mr. E. F

- 21. Q. You think they would take the water every mins and crops?—We should probably never be likely to year?—Not all. In some parts, as in the Hutwa Raj, they get anything more severe than the 1896-97 famine would take it for their rice nearly every year. year?—Not all. In some parts, m in the Hutwa Kaj, they would take it for their rice nearly every year.
- 22. Q. In what part of the district is there most well irrigation?—Pretty well all through the district.
- -23. Q. The district is not given up body and coul to rice?—No; the rice is about 25 per cent. only. The most important crop is the rabi.
- 24. Q. Are the wells on the increase in number?-I should say they were.
- 25. Q. Have you been asked for takaci advances ?-Not since I have you been asked for tokatt advances r-Not since I have been Collector. The Opium Department have done a good deal in that way. The Hutwa Raj has done something and will probably do n great deal, more. Every year it gives advances for the purpose.
- 26. Q. Have you had any forecast estimate of what it would cost to put these channels in order P-No. I do not look upon this at all as a productive work, but merely as a protective work against certain had years, and over a period of 30 years there have been four years in which we have had to spend money in relief somewhere in the district in some form or other.
- 27. Q. Have you any laud in your district, the right bank of the Sandak, where the people object to irrigation; think that it deteriorates the land ?—No. There is a general iden—"once irrigate, always irrigate," but that is the only four. They use well water all over the district.
- '28. Q. There are a number of dog tanks, appurently, in Saran !—Yes.
- 20. Q. Do they make any appreciable effect on the irrigation?—They are not of much value; they are so small. They irrigate wheat, harley and augurenue considerably and all market garden produce and opium.
- 30 Q. Wenld you advocate the encouragement of wells !- Yes.
  - 31. Q. Is opium extensively cultivated P-Yes.
- 32. Q. (Sir Thomas Higham.) Ijunderstand that whon these channels were first opened they were handed ever to the planters. Were the planters responsible for their maintenance?—No. They took the water, distributed it and paid . for it.
- 33. Q. Why was not that arrangement satisfactory? wend rather other witnesses answered that question. It was not here at the time. There is a certain expense every year for cross bunds, etc. They used to say that the maintenance, including establishment, cost its. 30,000 a year, and the last low years it has cost about its. 6,000, I think. No one personally will come and put down Rs. 6,000. That is why they were closed.
- 34. Q. You cannot put on the cess with the law as it stands; can you?—Yes, if the zamindars would agree to add it to the embankment cess, and I do not see there would be much difficulty about them. The only practical difficulty is this that the embankment cess contract has new 185 years to run, because we have just started a new contract for twenty years.
- 35. Q. What is the contract?—An estimate is made of what it will cost the Public Works Department to maintain this embankment during 20 years. That is divided by 20 and the sum annually recovered from the zamindars.
- 36. Q. Is the number of wells increasing every year ?-I think ec.
- 37. Q. Do you make advances for them?—No; a few advances may have been given in 1896-97 by the Collector; but advances are continually given for this purpose by the Opium Department and the Hutwa Rnj.
- 33. Q. Only for the cultivation of poppy ?—Yes, in the case of the former, but not in the case of the latter.
- 39. Q. If you had welrs, would you charge for each watering P-No; it would all be covered by the cess.
- 40. Q. So some people would got the beacht of the woirs and others would pay for them. Those weirs confer a special benefit on a certain number of proprietors near them; that to scene them is the only possible way to put a cess over the whole district?—There is naother method to estimate the area protected and have the cess realised from that area. That would be more equitable, but difficult.
- 41. Q. (Mr. Muir-Mackenzic.)—Do you consider the district is likely to be exposed in any year to very acute famine? I see the numbers in the 1874 famines were exceedingly large. Do you consider the 1896-97 famine was absolutely as severe in failure of

- 42. Q. What will be the total area which this system of 27 Oct. 02. onnole would irrigate: 20,000 nores ?- A great deal more than that. It might be a hundred thousand, but perhaps net.
- 43. Q. That is in addition to the 72,000 already?—That is private enouls; I don't know what those figures mean, but believe they refer to existing drainage channels improved by certain landed proprietors such as the Hatwa Raj, and some indige instories for irrigation, but these are largely dependent on water remnining in the canals or channels which are now closed.
- 44. Q. Are there any instances of extensive areas being irrigated by wells P-Not in Saran.
- 45. Q. What is the crop : highly intensive cultivation highly manured P-Generally in the neighbourhood of villagos.
- 46. Q. Do they over irrigate wheat ?- Yes ; but not in a year of good moisture.
- 47. Q. Arothe wells worked with bullocke or lover ?-Both; tae lever mostly.
- 48. Q. According to the figures here the area under irrigation is about a half?—It must be mere.
- 49. Q. Woold a third be protected in a bad year ?-That would not include the Denras irrigated by the spill from the river. Last year, when there was considerable want of moisture, the rayate were making kachcha wells very considerably.
- 50. Q. Do you think a large extension of welle is possible in that district? Would there be difficulty in finding manure or money to make the welle? Could they be doubled ?- I dore say.
- 61. Q. Are you satisfied with the machinery at your command for giving advances ?—Yes.
- 52. Q Is there any difficulty in giving advances owing to the cultivators having to come in to head-quarters ?- That we could meet conselves in utilising the planters, and although this is not provided for in the rules, I believe maney was so advanced under the Agricultarists' Loans Act through the medium of selected planters in 1897; and I may add that in the same year in Cutiack (Orissa) I sent money out to the rayats in their villages by a Deputy
- 53. Q. How would you advance through the planters?—Make inquiries first as to who wanted them, and then entrust the money to the planters and also by getting the selected planters to make the necessary preliminary
- 54. Q. (The President.) -Mr. Tytler in his paper says he advanced Rs. 1,86,000 to build wells, and he was able to do this largely by his own personal influence, having devoted his whole time and energies to this particular work. Do you think it would be an advantage to have at any rate, for a time, a special officer to push it in that way?—Yes, if the need is distinct.
- 55. Q. Are you not satisfied that the need is distinct?—I shoold like to see first the rivers properly atilized. That would protect a very large portion of the district.
- 56 Q Mr. Tytler says it would be possible to have a well in every 10 or 15 acros of the district ?—In some parts.
- 57. Q. Is there no danger of exhauting the water in the and-soil?-Not, if we have water coming down from the
- 58. Q. (Mr. Rajaratna Mudaliar.)—Could not the proprietors pay the cost of keeping upon those channels and recover from the tenants P—It would require logislation.
- 50. Q. They can levy enhanced rents ?—It is only required for protection; not every year; it is not with a riew to increase produce. Nor could they enhance the ronts legally.
- 60. Q. You say the construction of the embankment has deprived a large area of the benefit of spill irrigation; what area was affected ?—The whole district.
- 61. Q. Has onlivation suffered in consequence ?-That is going back to ever a hundred years. Conditions must be clanged. It must have been an improvement generally, but undoubtedly individual portions have been injured.
- 62. Q. Do you think proprietore can be trusted to disbarso loans to tenants ?- Very fow. I doubt whother they would

Mr. E. F.

nndertake-te-do it. They would be airnid to deal with Government money, and I do not think it would be very safa to give it to them.

27 Oct. 62.

63. Q. Is the whole of the embackment cess spent?—I helieva the last contract was an actual loss.

64. Q. (Mr. Muir-Mackenzie.)—Mr. Tytler got the smaller cultivators to combine to receive the advances. Is that practicable?—Mr. Tytler was an unusual person. He had been 26 years in the district and knew pretty well every cultivator personally in the north-western holf of the district.

### WITNESS No. 26 .- COLONEL J HODDLING, Planter of Chapra.

J. Hoddling. with this district?—I have been 81 years in Chupra.

27 Oct. 02. 2. Q.

2. Q. Were you there in scarcity or 'fsmine?—Five times in my recollection.
3. Q. Fumino?—No. 'There will never be a famine in

- 3. Q. Fumino?—No. There will never be a famine in Chopra. The mesus of communication are so plentiful. But I have been there in five periods of scoreity when they did not know where to turn for a penny.
- 4. Q. What recommendations would you make to mend matters?—One neetbod is obvious; the working out of this cannl plac which Government started in 1832,—the canal Mr. Growse spoke of.
- 5. Q. Whot would he the hest course to adopt for the future working of that canal?—It is a very long story and there is a grent deal of bitterness and feeling about it. It was promised that if the planters guaranteed to pay a num to Government for outlay and maintenance on the canal, it would be opened. The sum was divided among eight planters and there was a clause in the agreement:—"No water, no payment." We were continually being disappointed about the water-ampply, and when we claimed romissions of our guarantee, we ware mot with oil sorts of objections. Thora was also a clause that we were to collect from all the rayuts who took water, and that in cases where we could not realise the money, the Collector of the District should take when we wanted to go in for the certificate procedure the Collector, I am certain owing to great press of business, was unable to carry it out. (The certificate acts as a decree of the Civil Court.) There is hardly a guaranter who has not large outstandings to this day, because the certificate procedure was never enforced. When the agreement expired Government then said—"We will now outer into a fresh agreement. Your guarantee in the past was not sufficient. You will pay a higher guarantee, and wa will cut out that 'no water, no pay' clause, and you shall pay this higher guarantee whether we give you water or not." The guaranters refused to accept these terms since then. The Caual Department has persistently refused to open the capals nules would pay down on the nuil the earn they fix on before any work is done.
- 6. Q. What is that snm ?—Rs. 21,800 was the last estimate. The canal protests 1,700 miles of country. In 1884 when the canals were not working properly they actually irrigated 21,000 acres.
- 7. Q. What would be a reasonable modus vicendi?— The planters are not in a position now to gnarantee anything. Indigo is in such a condition that it is no ass discussing any modus vicendi, because the planter bus practically ceased to exist.
- ecased to exist.

  8. Q. Ho exists us a zamindar?—He is hanging on, but I am ufraid his last hour is very close. He cannot get meney to work his factory, much less gnorantee anything to Government. You can only think now of proteeting the district from distress and the planters must be loft out of the account. If the scheme were taken over by the District Boord, it could be worked perfectly ut a small cost. Up to 1884 it cost R. 32,000 a year according to Mr. Fanikaer's account, hat that included three or four cogiucers, a lorge subordinate etofl, pension list and leave allowences. The netal working cost since 1892 works out at Rs. 6,200 a year.
- 9. Q. Would the cultivators necept the cost of making and mointaining as a cess?—Without much difficulty. About two pies in the rapes would cover it.
- 10. Q. How long have the canals remained closed?— Since 1892 when our guarantee expired. Thay carried it on under a modified guarantee for two years more.
- 11. Q. And you think that all that is wanted would be a trifling outlay on maintenance and the opening of the sluices?—It would he a use naless you put weirs at intervals of, say, 10 miles on all the causles. Perhaps Re. 2,000 a weir would do it. I am building a weir now myeelf, and it won't cost me more than that.
- 12. Q. That is cheaper than we generally do it. Do you think it would be a great been to the district to have these

canols opened ugain P—It would eave un enormous amount of dietress. They would be used whenever the rainfall did not come at the right time for rice, and for high land cultivation in years of drought, which is about once in six years in Chupra.

- 13. Q. In those dry years were the crops on the higher grounds all lost?—Absolate failures.
- 14. Q. If these canals were opened again; would they he enough for the district of Sarun with wairs in addition?—Yes. The Chupra District is divided into 'two classes of soil. In about \$\frac{1}{2}\$ crops are sown on notaral necistary. This is the area required to he protected. One quarter is another class in which all crops are sown practically on irrigotion. That already has its wells. I cannot speak from personol experience of this quartar of the district. The wells are fed by earface drainage. Pakka wells are not corried through the sub-soil. In the other three quarters any of these wells are perfectly necless for sowing erops on in the natural moisture tract. A pakka well will do at the outside five bighas; that is light after watering. The part for sowing on with wells is where there is no sandy sub-soil. It would ovet me Rs. 500 to out a well through that sand for good drinking water. I would be on a spring 30 or 40 fect deep.
- 15. Q. That would pull you through a drought?—No; it would not do more than five bighas a day. A bigha with me is \( \frac{2}{3} \) of an more roughly, i.e., \( \frac{2}{3} \) of an acre.
- 16. Q. (Mr. Muir-Mackenzie.)—Is these mach room for the extension of wells in Saran?—If they had to replace the notural moisture with artificial moistore, they would be no use at all. A well every hundred yards would be required when we do want water. It takes n lot of water to make up for the failure of the rains.
- 17. Q. (Sir Thomas Higham.)—How would you increase the embankment cess to include both?—It would require legislation. I do not think the zamindars would pay anything naless they were obliged to. They may be induced to agree, but I should not be hepeful of persuading them myself.
- 18. Q. Was the year in which 20,000 nores were irrigated a dry one?—Yes. There was water coming down and the rayats took it. The canals were not working very well. The district wanted water two or three time since and we got it in November and December, when the rice was dead and it was too into to sow the rabi. They would not open the canals before the rains hegun. I blame nohody, but it could have been done, if the work had been commenced in time.
- 19. Q. Taking 21,000 neres as a maximum done, will you increase that largely by parting weits on the rivers?—Yes, and by also making the most of small works from one channel to another. Octainly more than 21,000 acres could be irrigated. You might do 100,000 acres with cheap works. The part of the country approtected by the causles is that which is always irrigoted and therefore presumably adequately protected by wells.
- 20. Q. (The President.)—Should the District Board be anconraged to borrow from Government a sufficient sum to put these works in order and to control them afterwards, Government giving them power to levy a cess? It would he a perpetual burden open the district?—Yee, but now whenever we are going to have district, the District Board lies to set uside a large portion of its funds to meet it. We had relief works in 1892, in 1895, in 1874, the Bengel famine, and in 1866, the worst famine of the lot. The relief works were making reads, which we do not want; we have the hest reads in Bibor, and digging tanks in each you, which is ubsolutely necless.
- 21. Q. (Mr. Muir-Mackenzie.)—Have you perfect confidences in the efficiency of the District Board?—Yes, perfect.
- 22. Q. (Mr. Rejaratna Mudaliar.)—With what agency would they manage these works?—I would increase the District Engineer's staff. The rest might be left to the Collector.

11

23. Q. Why chould the District Board management be more efficient?—Because it is directly interested in preventing scarcity. No doubt the Engineering Dopnriment would do their hest, but it is not a productive work; it would not, in their apinion, compare with schemes that pay Government, and they, would not have the direct interest in completing distress. boting distress. .

(Mr. Hare.)—In 1892 Darbhanga had to run into debt two or three lokhs. The Board has to hypothecate an

income for relief works.

21. Q. (Mr. Muir-Mackenzie.)—You have a strong District Board ?—Yes, I think so.

25. Q. A lot of plautors on it?—A lot of Europeans on the Board.

26. Q. (Mr. Rajaratna Mudaliar.)—Would the cultivators take water for 100,000 neros every year? Or would you only got applicatione one in six years?—Generally speaking, they would take it about once in six years.

28. Q. And would the District Board undertake the construction of all the improvements for a payment of two pies in the rupes?—I believe that would be quite suffi-

ejeut.

29. Q. Would it not be right to charge at least a rappe an acre?—If you ere going to levy a water-rate you want extensive machinery for collecting it, and then you must have a large cetablishment. Two pies in the rupee, I suggest, would be paid by the laudlord who would be allowed to make his own arrangements for collecting half from the myats, but it would be paid as part of his revenue.

80. Q. Could they not be induced to collect the water-rate by a commission of about five per cent. ?—Nat in our partiof the world. If you haid a two-pia cess, the rayats would say it was an Government order and must be carried out; but if you tell the rayat he has to pay something down, he would say "it is not necessary" end he will not do it. The two-pic cess would give Rs. 52,000 in the Chupra District. I would put it over the whole district. The cause of this want of water in the Chupra District was the making of the Gandak bund. It was thought right to charge the whole district for the heacits of the Gandak band, and I do not see why it is not just to charge the whole district for this cess. for thie cess.

31. Q. One wrong does not justify another ?-I am not prepared to eas that the first cess was an injustice. By opening the causes the spring level of the dietrict will be kept up. A minfall of 40 inches gives n rabi.orop; a rainfall of 20 inches will give nothing. If you have the water level kept up, you will get a good crop, possibly with even only 20 inches.

32. Q. One man gets a direct benefit and nuother an indirect one, but you would make both pay equally?—Yes, but to be absolutely equitable you would require very extensive machinery for collection, and the whole scheme would be put out of the region of practicel politics altogether. The people say—"But for the Gaudak hund we chould have had the water we require. Others have had their benefit from the land, we want our banefit now by the conging from the bund; we want our benefit now by the opening

# FOURTH DAY.

## Muzaffarpur, 28th October 1902.

# WITHES No. 27 .- Mn. A. OGILYY, Mnoager, Hatwa Raj.

1. Q. (The President.)—You are Manager of the Hatwa Estate?—I have taken over the management within the last six months.

2. Q. Have you other interests in Saran ?—I have managed properly there. I have had an acquaintance with the district for 25 years.

- 3. Q. Is there any strong feeling in Saran as regards the improvement of irrigation or necessity for having it?—There was a very strong feeling in the Hotwa Raj last yeer as regards the importance of having the four existing caunlized rivers opened practically at a moment's notice when they are required.
- 4. Q. Those being the four that have been mentioned and that have been closed for some time?—Yes, and in addition to that I think the position of the Hatwa Raj is one in which irrigation should be possible for even a larger area than these four rivers can command; there are two other rivers that could be put in the same position; they would not be remunerative, but they would be useful as protection against families. This, I believe, could be done at very small expense, and it is a question whother it would not be worth while to do it.
- 5. Q. Would the water be used in ordinary years P-Not of the extension; a certain amount would probably be used in ordinary years; although the minfull uny be unplo, there is great irregularity and irrigation may be required at a moment's notice to produce the best results.
- 6. Q. Elsewhere we have found sometimes that a superior sort of rice may be grown if the people can rely upon the water with certainty. In there any likelihood of that here?—I don't know in Saran. It probably is due in other districts to irrigation altering the character of the land brought under rice; that is, rice being introduced into a new sort of soil. I think it is possible that it would have some slight effect. elight effect.
- 7. Q. To put these canale in Surau into proper working order, I suppose a considerable outlay would be required at first?—I think a fairly large outlay is required for putting in sluices, so that the water is brought to a useful level.

- 8. Q. Would it be necessary to throw weirs or bars across at the heads of distributaries?—Yes, I don't think that would cost very much; they would be small
- 9. Q. Would the district be prepared to pay for their works?—I can only speak for the Hatwa Raj; it represents about one-fifth of the district. I think the Hatwa Raj would be well advised to agree to considerable expenditure ns protection against famine.
- 10. Q. I have no authority for saying what view the Government would take; assuming that Government were willing to grant a loan at a cortain percentage, do you think the loan would be taken up in the district by the District Board or any other machinery that there might be? Would they be inclined to assume responsibility for a debt of that sort?—I think so,.
- 11. Q. Would the District Board like to carry out the works, or prefer that the Public Works Department should earry them out and then make them over?—I think the District Board would be well advised to have it done by the Government, and then take them over.
- 12. Q Should recovery be by cess or water-rate P-I think it must be by cess, because the work is protective and not rounuerative.
- 13. Q. Do you think that would be accepted with tolerable equanimity? If they knew that the water was certain as in the case of the Sone Canals, would they be tolerably well pleased to pay a cess?—I think so. It would not be looked upon acceptably beachief in Saran which is not so. dependent upon it.
- 14. Q. Of course, if it were laid upon the whole of the district or in n sub-division, a great many would have to pny who might not have the water?—If the extensions which I have proposed were carried out, they would practically command the whole of the district.
- 15. Q. Now these extensions which you propose, have they heen technically examined?—No, I have acted for assistance with the view to having them examined. The thing was started shortly after I came to Hatwa.

27 Oct. 02.

Mr. A. Ogilvy.

28 Oct. 02.

Mr. A. Oyilvy. 28 Oct. 02.

- 18. Q. It means placing claices along the right back of the Gandok?—It would require head works in the Bacci nullab. I would utilize the Jarai nullah which comes out of the same seta as the canalized rivers. This would require a bund; the same as that required in the seta below the sluice of the Dahar river.
- 17. Q. The irrigation is all lift, I understand P—Yes, at present, the great desideratum is to roise the level of the water in order to utilize it by flow if possible.
- 18. Q. Ie there any apprehension of fever from insanitary conditions?—On the contrary: as far as I know at present, the Jarai is considered feverish owing to want of flow, but the conditions will be improved.
- 19. Would the district be prepared for the barden of a loan?—I conclude it must be prepared to nea-pt the burden of nanual mointenance; it would require a certain amount of inspecting and patrolling establishment; it would be a very light impositim.
- 20 Q. Would they prefer that the whole thing should be taken over and made an Imperial work to be worked by the Public Works Department?—Not if the control is removed from the locality.
- 21. Q. They prefer it should rest with the Collector and the District Board ?-With the Collector practically.
- 22. Q. The District Board has the confidence apparently of the people here ?-Yes.
- 23. Q (Sir Thomas Higham.)—You think this should he worked by the Collector with the assistance of the District Engineer and the District Board is to be brought in for the seke of financing it ?-Yes.
- 24 Q. I think we were told yesterday by a witness that a bund was made for the benefit of the Hatwn Raj to which the rest of the district would have to contribute?—The work protects the whole district from immediation (Explained on map.)
- 25. Q. What is your ideo of the way in which recovery should be aiodo for the eart?—I think a coss is best. I don't think a water-rate is possible under the conditions under which it would be worked.
- 26 Q. (Mr. Muir-Mackenzie) The coss would be a percentage on the revenue of the zamiudars?-Yes.
- 27. Q. Do you contemplate the District Board mounging the maintenance of the canalization system?—Yes.
- 28. Q. Would they control the maintenance establishmont, etc.?-Yes.
  - 29. Q. And pay the men?-Yes, certainly.
- 30. Q. The eess would only be the equivalent of the interest on the initial works?—The cess should cover maintenance also.
- 31. Q. Is there any room for the extension of well irrigation in Saran?—I think there is. I can only speak for the Hatwa ttaj; the Raj has constructed wells practically as fast (far?) as they can be made.
- 32. Q. What is the system by advonces to cultivators? -We do it at our own expense.
- 33. Q. Does the Raj get an enhanced rent f-I don't think it would enhance its rent for a thing of thin cort. We would register them os improvements as a matter of
- 34. Q. Has it registored wells as improvements up to the present ?—Yes.
- 35. Q. What is grown under these wells?—They were originally started for poppy; there is also sugarcane, wheat, and, of course, garden crops.
  - 36. Is there any tobacco?-No.
- 37. Q. Generally valueble crops that require high cultivation? - Of course a well is more necessary when high eultiration is possible. They like to have wells also in sandy tracts that cannot be irrigated without them, though high eultivation may be out of the question often owing to the distance from a village.
- 38. Q. Whot men does o well irrigate in each tracts? Four to five bighas is the maximum in sandy coil, a bigha veing equal to fths of an acre.
  - 39. How much does a well cost?-About Rs. 70 to 80.

- 40. Q. Pakka P-Yes, bricke set in mud.
- 41. Q. How big ?-Seven feet in diameter, with two
- 42 Q. (Mr. Allen.)—The price you mention would not include cost of labour?—Well, labour is very cheap.
  43. Q. (Mr. Muir-Mackenzie.)—The cultivator does it himsell?—Yes.
- 44. Q. You say Saran is not so dependent as other tracts on canals; in that a well cotablished fact? That is my own experience, which is confined to the Eastern Sone Coool; the area under my management, that was watered by the conal, was entirely dependent on irrigation.
- 45. Q. And would not have been previous to the intro-duction of the canal?—It always was irrigated by come means which the Sone Cenal was in substitution for.
- 46. Q. Saran was not previously irrigated by such means?—Soran genorally is not irrigated.
- 47. Q. (Mr. Rajaratna Mudaliar.)—How many wells hos the Raj constructed in the past ten years?—I cannot tell you; my experience of the Raj only dates from six menths ngo.
- 48. Q. (Mr. Muir-Mackenzie.) How many have you made in your time?-I have sauctioned 50 to 60, as many os I can push through.
- 49. Q. Do you hope to get through a hundred a year?-
- 50. Q. Would you bope to duable the number of wells within n reasonable period?—I have not yet been able to acquaint myself thoroughly with the conditions of the Raj. I cannot say. I can imogine it to be possible.
- 51. Q. Within how long a period-20 years?-I hope in
- 62. Q If a similar energetic policy were pursued, coald that be done in other parts in Saran?—The conditions are not the came. The Hatwa Raj is doing them for nothing. Proprietore elsewhere are not in a position to pay for wells
- 53. Q. The Raj are making the welle purely from henca-
- 54. If it was a matter of paying, could wello be doubled la your Raj merely to pay?—It would pay the rayat, not the proprietor.
- 55. Q. (Mr. Rajaratna Mudaliar.)—The Raj does not expect to make any profit out of these well-?—No.
- 56. Q. Would there and be some indirect gain in the chape of certainty of rent?—Yee, to a certain extent undoubledly.
- 57. Q. What is the rate of rent on such lands ?-Tho average rate of rent is about Rs. 3-8 per bigha.
- 58. Q. Why do you prefer the District Board to the professional departments P.—Because it is on the spot; the District Board represente oil the intereste of the district.

ψ.

- 59. Q. The gentlemen of the District Board can even now represent their wants to the Court Deportment?—Yes, but it takes six months.
- 60. Q. If there is a special Executive Engineer in charge of the works? Certainly, at present it takes too long.
- 61. Q. If that delay weie avoided, would you still prefer the monagement of the District Board?—Yes, it would be freer from the red tape that nos been necessarily intro-
- 62. Q. Do you think the management would be less costly. I think it would be better to begin afresh.
- 63. Q. On whot grounds would you levy a cess on the whole district and not simply on the area commanded?—I think the whole area is commanded.
- 64. Q. But some portions will get greator beaufit than others; won't they ?—Yes, to some extent, it is so very lard to arrange for the collection of n woter-rate. It would be very difficult to discriminate between area irrigated and that indirectly benefited. It might bo done. .
- 65. Q. Would it not be just to do it ?-It would be as well if it were possible.

Mr. J. D.Macgregor.

WITNESS No. 28 .- Mr. J. D. MacGeegon, Arrowali Concera, Chupra.

1. Q. (The President.)—Are you a resident of Saran?
—Yes, I have been bere for 30 years. 28 Oct. 02.

2. Q. What part of the country are you in !- The south-

Macgregor.

28 Oct. 02.

- 3. Q. You have just now heard what Mr. Ogilvy said; do you agree generally with him?—Yes, except in seme
- 4. Q. Where do you differ?—With regard to the District Baard and ortaking the whole thing, I think it would be better that they should be made from Imperial.
- 5. Q. Do you mean on first construction?—Yes, it might he too large a business for the District Boord.
- . 6. Q. Do you agree with him in thinking that, after the works were put in proper order, that the Board might keep them going?—Yes, certainly; having been put in order rethey should be made ever to the Board.
  - 7. Q. On what other points do you differ from Mr. Ogilvy?—I happen to be best ocquainted with the southeast part of the district where conditions, both as to soil and notucel conformation of the country, are different from the north-west or Hatwa Raj side.
- 8. Q. What other variations would you desire to meet the conditions of the south-east corner—extension of the Saran Cauals? - We have sufficient wells in that part; these wells are of very little use in dry years unless helped by sub-soil diamage which is benefited by the Saran Canals. I find from my own local experience that when these canals are running, water in the wells is 16 to 18 feet from the

- 9. Q. What is the depth of the spring level when there Mr. J. D. is no canol?-20 to 25 feet. Macage ago.
- 10. Q. You sold in dry seasons you could not trust to wells; do they run dry?—Yes, completely dry.
- 11. Q. Have experiments been made to dig them deep er?-Yes, but they silt in promptly; the sub-soil being
- 12. Q. Are you talking of pakka or kachcha welle?—Both; the sub-soil is pare sand.
- 18. Q You never irrigated rice from the wells?—No, it is impossible.
- 14. Q. Is this south-east corner generally rice country? -No, it produces mostly the richer crops—petotocs and
- 15. Q Do these foer canels supply water for the rabi? Yes, and for whatever rice we have
- 16. Q. When the canals were in proper working order, did they run all the year round?—Yes, nearly.
- 17. Q Are there any other points you would like to oring before nef-No, I agree generally with what the other witnesses have said.
- 18 Q. Whet do you feel about the cess? Woold there be a strong feeling against it?—There is a strong sentiment in favour of it; very few would object to the cess.

#### WITNESS No. 29 .- Min. T. R. FILGATE, lately of Burhowli Concorn.

- 1. Q. (The President.)-Have you had long experionee of Saran?—I have been connected with the factory for the lust 13 years and I have had personal experience in North Bihar for 26 years.
- rioneo of Saran f—I havo been connected with the factory for the lust 13 years and I have had personal experience in North Bihar for 26 years.

  2. Q. You have just heard the evidence of Mr. Mucgregor and Mr. Ogity; do you agree with them?—Yes, generally. With regard to the Saran Caanls, you have a considerable amount of water that is new running to waste, with a small expenditure on the present system the water could be utilized; you could fill the chaurs (which are natural reservoirs) and raiso the water level of the district; this is really required not as a remunerative work, for that it could nover be, but as a protective work in times of searcity. In the first instance, relief charges have to be mot by the District Beard. In 1806-97 10 lakhs were spont in Saran which the District Beard could not meet. At a conference hold in Sonephr on the 20th of Novomber 1896 Sir Alaxander Mackenzie, presiding as Lieutenent-Governor, said it would be perfectly impossible for the District Beard to meet that expenditure. Mr. Finucane estimated that, by the 31st of March 1897, 3 lakhs would have to be spont in Saran, and so the Lieutenant-Governor said this would have to come out of Imperial funds. In Saran ence in 4 to 5 years there is scarcity owing to failure of rainfall, and the change proposed would be one or one and-a-half lakhs to be spent in relief. There was not much speat by the District Board in 1896-97; they spont all their aveilable funds on reads and tanks. The general opinion in Saran is that mency spent on reads and tanks is unnecessary. Tanks are made as a famine work; these innecliately after the famine are left alone and silt up, so that when they are wanted they are-dry. The roods are in good order and there are no more new reads on which money could he spent. It was placed on record at the conference that money could be usefully spent in making distributaries of the canals, previded that arrangements are made for keeping water in the existing channels.

  3. Q. Would the District Board like the work to be
  - 3. Q. Would the District Board like the work to be carried out at once, or wait till a drought occurred?—If it could be arranged that the District Board should apply to Government for a loan to make certain improvements in the head-works and certain weirs in the streams, not a very large sum, the money could be availed of at the present time. A cess would pay not only for the interest on that money but a cess, on the whole district, on the besis of the ombankment cess, would also provide for a sinking fund for what is to be raised. This would probably be Rs. 50,000. The District Board are perfectly well able to carry out maintenance, because the District Engineer in this district is supervised by the Superintending Engineer of the Public Works Department; the District Board under expert supervision could certainly carry out any work that was necessary. 3. Q. Would the District Board like the work to be work that was necessary.
  - 4. Q. Would you like the District Board to carry out the preliminary work of putting these eannly in good order?—Certainly.
  - 5. O. Ruther than the Public Works machinery?-Certainly, I think under supervision.

- 6. Q. You heard what Mr. Macgregor said that it might be beyond the resources of the District Board?

  —I don't think so.
- 7. Q. Do you think that the district would accept the burden of this additional cess in consideration of the advantages to be gained by protection?—I certainly think they would, they puy nu embankment cess which protects them one year in four; the same thing would upply here with regard to water.

8. Q. (Sir Thomas Higham.)—Did you say the supply often failed; and that once in every four or five years you require 1 or 1; laklas to be spent on relief?—Yes, perhaps more.

- 9. Q. Have you been spending 14 lakhs every four or five years in the past 20 years?—I have been connected with this part only during the past 10 years. In 1892-97, when the severity was as serve as we are likely to have it, 10 to 11 lakhs were spent. In 1892-93 also a large sum was spent. 93 also a largo sum was spent.
- 10. Q. (The President.)—In 1896-97 Imperial funds were given?—Yes.
- 11. Q. (Mr. Muir-Mackenzic.)—You had to contribute one lakh?—No, nothing: one lakh was put apart, but was not spent by the District Board.
- 12. C. (Sir Thomas Higham.)—Have you may idea what lean would be required to put these works into order?—I could not possibly say definitely at the present moment. I should say something like 3 lakhs of rupees borrowed by the District Board would make certain distributaries and do what was necessary at the light.
- 13. Q. Do you think the amount required to pay interest on that lean and to cover all the working expenses should be recovered in the form of a cess?—
- 14. Q. Would that not be a very heavy charge?-No.
- 15. Q. Last year in Bengal the rates charged for water were not enough to cover the rates of interest and working expenses. Would not the cess be very heavy?-Nu.
- 16. Q. (The President.)—Colonel Hoddling said yesterday that a cess of 2 pies in the rupec would produce Rs. 50,000.
- 17. Q. (Sir Thomas Higham.)—I suppose this cess could only be imposed by the majority of the land-owners?—No, I think it could be imposed in the same way as the embankment cess; or, perhaps, it would come under the Drainage Act; I don't knew for certain.
- 18. O. (The President.)—I presume it would want legislation?—Yes, I presume it would.
- 10. Q. (Mr. Muir-Mackensic.)—Is there any room for the extension of well irrigation?—Not in my end of the district; that is in Baraoli factory on the Gangri.
- 20. Q. The soil there is not snitable?—It is suitable, but you can do so little with a well in the case of failure of rain; when you get in your cold weather sewings you can assist, but if there is no mois-

Filgate.

Mr. T. R. ture, nothing can be done; it would be useful for sub-Filgate. sequent watering.

- 28 Oct. 02. if you tood an improved cannot system?—I have no doubt wells would increase, because the water level would be raised. At present wells no net very deep, and when the rains fail and there is ne water in the rivers, most of the wells are dry.
  - rivers, most of the wells are dry.

    22. Q. When wells are made, are they made by zamindars or raynts?—Mostly by the raynts and net very lorgely. I had experience of very few in 1890-97. I was authorized by the Collector to give advances for wells. In 1896-97 there was only one case in which they applied for money for a well; four mon jointly lieble applied; this was a fairly big well; it was capable of preserving 5 to 6 bighas of crops; but there was not sufficient water in the well to raise a crop in the first instance. in the first instance.
  - 23. Q. Wore any of Mr. Tytler's wells in your part?
    -A few; they were principally to grow opium.
  - —A few; they were principally to grow opium.

    24. Q. They were made by very carefully selected men?—I should say so. With the permission of the President the witness made the following statement:—

    "As regards Saran, I don't think that sufficent use is made there of the existing sluices in the embankment; there are sluices letting in water from the Gogra and Gandak; these were provided by the Public Works Department and naturally they have done their part of the business. It was for the people of the district to make distributaries and carry the water to the chaurs; this has not been done. In some places I have personal knowledge of a good deal of rice being savedy in m; own part the big chaurs were

perfectly dry. In Chapra the Collector let in water and raised a 14 or 15-anna crep; the same thing happened on the Gandak embankment; the Collector went there and opened a sluice ned where water was got into the cheur the dén was very good. One difficulty is that clong these rivers a high bank intervenes between the river and rice lund; along the high bank where the lond is good at the time when water is required for the rice there is a maize crop in the ground; very neturally the mon possessing a maize crop objects to any weter going over his loud to save the rice erop inside. If distributaries were made along the bank, you could get a greet deel of water into the cheur raiside." Numerous cheurs could be filled in this way from rivers.

25. Q. Are there a greet number of these sluices? a muizo .

- 25. Q. Are there a great number of these sluices? I nm not sure; the Superintending Engineer could
- 26. Q. What is the size?—Some of them are 6 to 10 feet wide.
- 27. Q. Who are these sluices under?-The Public Works Department.
- [Mr. Grouse in conversation with the President gave some details of these sluices and explained that the difficulty was to get them opened at the right time owing to the absence of the officer.]
- 23. Q. (Mr. Muir-Mackenzic.)—You said that the tanks which were inide in the famine were useless, because they were not cleaned out but left to sit op; could they have been made any use of if they were properly looked after?—Very little; perhops only to water cattle.

#### WITNESS No. 30 .- MR. G. P. SIMEINS, District Engioeer, Saran.

Mr. G. P. 1. Q. (The President.)—How long have yoo been Dis-dimkins- trict Engineer here?—From the 3rd Jano 1897.

28 Oat. 02.

- 2 Q. Can you give no any information about the sluces?—They are primarily for dminsge of chaurs after the river has fallen.
  - 3. Q. How are they worked?-With the old screw.
- 4. Q. They merely begin to act when the floods are going down?-Yes. I have never seen them used for drainage or any other purpose except once.
- 5. Q. Have you anything you would like to call our attention to with regard to these canals î—I think, as a protective measure, they are most valuable; we have a very bad rainfall in the district and softer very much from scarcity. They could be utilized to give moisture in years of drought.
- 6. Q. There must be a large amount of silt?—That will tend to make them ultimately high level canals and enable us to work better in future
- 7. Q. Have you any idea, roughly, what it would cost to put this system of causts into proper working order. Mr. Filgate said 3 lakhs?—Yes, 3 to 4 lakbs would give a fair scheme.
- 8. Q. Then there would be maintenance charges f-That would be Rs. 20,000 to Rs. 80,000.

- 9. Q. Would there be quite within the power of the District Board to manage?—I think it would be better if original works were carried out by Public Works Department; they have better facilities and training.
- 10. Q. And the maintenance should be left to the District Board ?- Yes ; we could do the ministenance.
- 11. Q. From your knowledge of the district do you think the people would resent a cess to cover these charges?—They would like it, I have spoken to them about it and they said they don't mind a cess like the road cess; but they will not pay o water-rate.
- 13 Q (Sir Thomas Migham.) What about the Jharai? If the Jharai were brought into the scheme, it would be a neefol thing; it would water a coosiderable tract of country, both north and south.
- 13. Q. There is a trough f.—There is a high tract ron-lng between Dahai and Jhami. You would have to raise the level of the Jhami and so get water there.
- 11. Q. What is the total area that would be commanded F-Prabably 120,000 to 150,000 acres in the whole district (conversation over map). If the Jharni were included, it could irrigate 40,000 to 50,000 acres more than

Ċ.

15. Q. How do you arrive at that ?-From what I have seen of the district and the country that could be irrigated,

WITNESS No. 31 .- Mr. H. E. Annorr, Indigo Planter, Muzaffarpur, Tirhoot.

Mr. II. E. Abbo!t.

- 1. Q. (The President.) -- Ifow long bave you been resident of this part of the world ?-- 40 years.
- 23 Oct. 02.
- 2. Q. As what ?-Indigo planter and manager of zamindaris.
- 3. Q. Have yoo ever seeo famine in the district?—I have seen five famioes : it was very bad in 1861.
- 4. Q. Did you see the 1873-74 famine ?—Yes, that was a made famine.
- 5. Q. Is the district in a better situation to face famine new than it was before?—In one way, railways have opened up the country and asserted the bringing in of grain. In Sir Richard Temple's time transporting grain to the north was an impossibility, as the bullocks that carried it up ate it all. Now you can lay the grain at the doors of the needle. doors of the people.
- 6. Q. What measures would you advise to effect protection against famine in Marassarpur?—Controlling the rivers to start with on the American system; banking up the Bhagmatti which is a dangerous river. I think the

- stopping of innodation would be far more desirable for the country than irrigation.
- 7. Q. That of course is rather outside our field. Our Commission have really to enquire how far Irrigation could help?—I think it can help o great deal. Let channels be opened up; there is no doubt that a system of reservoirs in the way of tanks would be of enormous value. The great difficulty that we have to contend with is a poor population of tennots and a still more impoverished let of continuous. windars. There is not a single banker with big money behind him.
- S. Q. Is there much irrigation in Muzaffarpur ?- No.
- ?. Q. Are there pines?—They bove silted up, because the munindars have not forced a periodical cleaning out by their rayats.
- 10. Q. Assuming that artificial irrigation were introduced into the district, would it be availed of every year?—Land in this part of the world is exceptionally carious. When once you irrigate a field, that field gets obstinate,

28 Oct. 02.

and it will not grow a cold-weather crop again without irrigation.

11. Q. Is there a wish for irrigation in the district?— It is difficult to say. The rayots would like everything if they could get it for abthing.

12. Io there much well irrigation?—To a certain oxient by men who grow poppy and chena, and now that this new scheme is being put forward under the management of Mr. Rowland linden, I think wa sholl see it used for sugarcane which seems likely to be the fotors stople or of Tirhoot.

13. Q. It will require well irrigation; will it not?—Woll irrigation will drow "Roc" where it exists to the surface and it may benefit the standing erop, but that is only where the aniphate of coda is not in too excessive quantities. Mr. Tytler found that where poppy was nown, and there was sulphate of soda in the soil, well trigation drow it out.

14. Do people avail themselves of the advantage of making wells?—The expense is too greet for one coltivator. As a rule, one will not take the lean, and it is difficult to get three or four to combine. Uccosionally a well is dug on an ampleious occasion—o marriage or something of that

15. Q. (Sir Thomas Higham.)—You will require mere extensive irrigation ?—Wheo they begin to cultivate from it irrigation must be an enormous odvantage. It means sately instead of a toss up. Cano can be grown without irrigation in strong soils.

16. Q. Any extension of irrigotion in the way of small canals challd be done by means of a loou to the District Beard?—Yes.

17. Q. Recovered in the form of a cess?—Yes. That is Mr. H. E. Abbott.

18. Q. Would the cess be accopted generally throughout the district?—Yes. Sirkar ka hakum is still accepted humbly in these parts, I am glod to soy.

19. Q (Mr. Muir-Mackenzie.)—Mr. Tytler in the poper he farmished unrrated how he advaced Rs. 1,46,000 for wells to cultivators whom he induced to combine. If any porson took op the work as his sole duty, coold he do the same?—Yer, and a Goronmont official would have ten times the weight of a non-official.

20. Q. There ore plenty of lands suitable for such an extension in this district?—Yoo; it is different from Saran, which is sandy. This soil holds it moisture foirly well, and with 50 or 60 inches of min the crops are foirly sate.

21. Q. Would such an extension be possible in this district?—I doubt it. Io Tirhoet any extension would not be much.

23. Q. (Mr. Rajarvina Mudeliar.)—Could any facilitles be afforded by advancing leans at a cheaper rate of interest?—The cheaper the rate the more rayats are likely to take adventage of them.

23. Q Is an extension of the term from 20 to 30 years desirable?—Certaluly; more would be likely to apply.

24. Q. Ought oot some difference to be made in the cess between one men getting a direct benefit and aunther getting only an indirect advantage?—That might be left to the officers of the district. Certainly, it is just.

WITKES No. 32 .- MR. G. W. DIENET, District Engineer of Muzaffarpur.

Note on the proposed Ragmutty Canol.

The scheme as proposed by Mr. Mills was for a channel some 10 miles in length, strongly protected at its head work and at the inleta and ootfalls of the masies or water-courses crossed to convey water in scasons of drought from the Bagmatty rives, where there is an ample supply, and lead at anot the Paronodhar and Lakhandyo rivers which would act as distributing channels and from which arrivation is habitually carried out, either by flooding the adjacent channels carried out chants or natural depressime in the country or by lifting the water for the irrigation of land close to. There is a regular system of pains an irrigation channels constructed by the malits from the river Irakhandye, in some cases ranning for miles lahad. Work was commoneed no the excavation of this olumnist during the famine of 1897, but not completed. It was proposed merely as a scheme to provide for the trigution of rabi and dry weather crops in times of drought and would be most useful for this purpose. The cost is estimated by Mr. Baller at its, 2,05,762, say, its, 3,00,00 exclusive of establishment and other charges. The length of the Purandhar and Lakhandyo rivers, measored along their coorses, from which water could be attilized for irrigation purposes, io some 90 and 60 miles respectively, and assoming that a tract of country 2 miles in width on each side would be more or less benefited, the area works out to 600 square miles or 3,64,000 acres. The Collector of the District (Mr. Chopman) in his report on the subject dated extinoted thio os 200 oquare miles, which is practically identical, excluding the Purandhar. (The area served by the Lakhandye I calcu-

(Mr. Chopman) in his report on the subject dated estimated this os 300 equato miles, which is practically identical, excluding the Purandhar. (The area served by the Lakhandye I calculate as 60×4= 360 squore miles.) Mr. Butler in his report assumes that the High Level Canal with distributative would command 210 square miles of country and bases his financial calculations on irrignting 103,000 norea. Mr. Mackenzie, the Minnager of Hojkhund Factory, situated on the Lakhandye and who regularly irrigates from it, estimates the cost of bunding the river and running water down through existing pains at half as anna a bigha (= 8 acre). Funds are generally made at introvals of some 10 miles apart, but could with a good water-supply be done at less than half of this. Taking the existing of rennatances and the area served by each bond, as stated by Mr. Muckowzie at 4,000 bighos, the Lakhandyo river may be assumed under existing of reunstances to irrigate 90 ÷ 10 × 4,000 = 30,000 bighos or 29,054 ocres, or at 5 miles intervals 53,108 acres. This two rivers combined, if a sufficient water-apply be provided, would distribute sufficient for 99 + 60 = 160, 160 ÷ 6 = 80 bands = 30 × 4,000 = 120,000 bighos = 08,849 acres. This is, I believe, an underestionte, but is based on

Mr. Mackenzie'o experience. The interest on capitol cost at 4 per cent, would amount to Rs. 12,000 per annose and it 5 per cent, would amount to Rs. 12,000 per annose and it 5 per cent, would amount to Rs. 12,000 per annose and it 5 per cent content of the tract served (viz., 384,000 acree) were assessed of 4 minus per acre, the incume would amount to Rs. 12,500. In order to regulate the rivers and the water-aapply they would have to be brought under no Act somewhat similar to the Bengal Sanitary Drumage Aot, which provides for an assessment on the arm benefited. Mr. Toogond lu paragraph 7 of his report forwarding the estimate stotes that "for rabi and but weather irrigation the cannot an be fed and water relied on." This is all that was channed in those demc. In year dry sensons the water in the Parandhar and Lakhandye rivers is intercepted by bunds high up their nourses, froquently outside British territory, whereas there is a constant nupply in the Lagrantty which runs to waste. If a small portion of this were run into the chairs, it would not only allow of the cultivation of moch rabi and hot seather crops as well as the early sowing of rice for seedlings, but would also appreciably roise the woter level of the surrounding country.

of the surrounding country.

2. In the foregoing paragraph the arguments in forour of the scheme as proposed by Mr. Mills are briefly detailed. In 1808, the year following the famine, Mr. Butler was deputed to investigate the subject and to submit detoiled estimates. Its characteristics were altered from that of the provision of a water-supply to augment existing and established local irrigation to that of a high level consistent which the water would be supplied by gravitation, along with the necessary distributaries and adjuncts, which he estimated to cost some Rs. 4,00,000 more (exclusive of establishment charges). This provides for their rigation of the klarif crop in October to the event of a failure of the rains. From the deduction drawn by Mr. Toogood from rainfall statistics of the Sitomahli Sub-division water would be required for I year in 4, or 2 years in 5 for a full crop outturn. It is further stated, and this is an uncontrovertible fact that, without a worr corose the Ragmotty river, the result (in October) would be problematical. Moreover, the site is one eminently unfitting for the construction of o work of this description.

2. From the evidence before me and my local knowledge

struction of a work of this description.

3. From the evidence before me and my local knowledge I nm of opinion that a High Level Canal such as last proposed is ancalled for by the streamstances of the case and nearly impracticable. Mr. Mill's original seleme alone remains to be pusidered. It has much to recommend it as it provides for the utilization of water whileh runs to waste during sensons of drought, and which is worth gold, but it is one that, owing to the easterly trend

Mr. G. M. Disney.

28 Ost. 02.

Mr. G. W. of the Bagmatty river, and the action of the recent flood
Disney.

on the Stamarhi Dheag branch of the Tirhoot Stote railway will have to be very carefully worked out and ample
provision mede for the spill of flood water, when such is
necessary, with this in view I had the excavated sections
made into clongated embanked tanks, while the work was in progress.

4. The figures given by me as regards probable belance hatween Income and Expenditure ore merely very approximate. These would have to he carefully verified. The estimated cost of se far completing the work as to make it of use would probably he—

(Interest on balance of estimated cost, Rs. 1,25,000 at 4 per ceat. = Rs. 5,000 per annum.)

5. The main advantage of the scheme is, in my opinion, that it odmits of the filling of many chaurs in the country, thus keeping up the water level during seasons of drought. It will therefore benefit a larger area than that actually affected by surfoce irrigation.

Irrigation and the filling of chaurs.

The great want of North Bihar is a means of filling up the chaurs or notural reservoirs of the country during ass-sons of drought. There is maple water available, but this, as a rule, rune to waste in the rivers owing to there being no organized means of its ntilization.

In order to arrive at a conception of existing circumstances it most be recognised that, in order to save lands from being flooded while the rivers were high, marginal embankments have from time to time heen constructed, the consequence being that the river-beds have been raised by the deposit of silt, and have become to some extent high level cansis with no fally developed means of conveying the water from them. There are sluices in the Gandak and Turkoy smbankments in this district, but there is much scope for the excavation of locally called pains, or distributing channels from them. In the private hunds along the Bur Gandak and Fagmatty rivers I have not seen only attempts made at this. Owing to the shove facts many of the chaure are only filled up either by a heavy local rainfall, or when the hunds hurst doring flood time. Moreover, mony chaure could be filled by jediciously made channels from the rivers, the inlets to these heing protested by slaices. This, in addition to the direct gain to land irrigated, would be of great service in raising the water level of the vicinity.

What I take it as required in order to provide for the

What I take it as required in order to provide for the woter, which is now wasted being made avoilable in seasons of drought, is some less elaborate system of irrigation than of arought, is some test emacunic system of ringation than thost in a high level and expensive canal which is, I am of opinion, not necessary in districts similar to this with an average anamal rainfall of over 45 inches; merely inexpensive channels leading the water direct to the chaurs would suffice, the cost of making and maintaining these being met by a contribution or cess from the lands benefited. This might prabably he arranged for by enlarging the scope of the Bengal Sanitary Dramage Act No. VIII of 1895 which makes provision for the conservancy of rivers, if not provided for in any other Act.

- 1. Q. (The President.)-Have you been long here?-
- 2. Q. Have you had anything to do with the preparation of these schemes for the north part of the district?—Indirectly from time to time. The Boguntty Canal is the principal ons.
- 3. Q. You propose to improve the irrigation by bringing the sapply naw existing fram a more certain source?
- 4. Q. Have you been here through n famine?—Thres—1833, 1892 and 1897. They were, rather, scarcities. It was never intense famine. In 1888 the expenditure was never Rs. 2,39,000, in 1892 Rs. 93,000 and in 1896-97 Rs. 15,21,000 in this district almos. Taking the 18 years the negrous is more lake a year. the average is aver a lakh e year.
- 5. Q. Whot measure would you suggest for protection it against future famines?—The utilization of the existing water, as far as possible, is the naly thing, and the upening out and making of pains or irrigation chounels and sinces protecting these.
- 6. Q Are there many pains as it is P—Not many in this district. Must rivers have been handed along the margin from time to time, thus preventing the water from getting into the chaurs. Those are now dry in the dry getting into the chaurs. Those are a weather and the water level goes down.
- 7. Q. Were these chaurs formerly rice fields ?-Yes, and are to a certain extent still.
- 8. Q. Does not the district want water fire years oat af six?—Four out of five, probably.
- 9. Q. If there were n complete system of irrigation here, would it be availed af every year?—I do not think so.
- 10. Q. I suppose irrigation has only occupied a small portion of your time?—Yes.
- 11. Q. (Sir Thomas Higham.)—The Bagmntty scheme is no small value for irrigating the kharif crop!—Yes. I recommend that the cut made in the fumnce he completed.
- 12. Q. Your idea is that this should be a district work and the amount recovered by a cess?—Yes.

- 13. Q. If there is only o small supply of water, the first 10. Q. It ture is only 0 small supply of water, the first comers would get it, I suppose?—There would have to be series of by-passes. The river would have to be divided into sections by bunds and the water passed down to each in turn. The river might be banded in the hot weather. It is 500 feet between the hanks.
- 14. Q. Any other scheme for this district?-The other sobenes are for catting pains in the existing embankment to feed the chaurs. There are numeroes embankments in the river which shut out the water from the chaurs.
- 16. Q. Are these pains private nnes?-A few private
- 16. Q. Where do they get the water from ?-By buading the river.
- 17. Q. The cost would be great?—The muin Bagmutty costly.
- 18. Q. There is flooding from the Bogmatty; is there not?
  -Yes; this year it came down through Durbhanga and itamarhi. It cannot be stopped, because it comes from Nepalese territory.
- 19. Q. It is the cause of much damage to crops ?- A good deal of temporary damage, but this is more than recompanied for by the silt that is brought down by the Bagmuty and which improves the land.
- 20. Q. That protection from floods is more important than providing for irrigotion!—No.
- 21. Q. (Mr. Muir-Mackenzie.)—Out of those 18 lakhs spent how much cams oot of the fands of the District Board?—I believe a lakh and-a-half, roughly.
- 22. Q. If oll the schemes you hove enggested—the canols from the Baguntty and the opening out of sloices—were udopted, how large a proportion of the area weald he protocted?—I calculate the first would do six hanared square miles. I should have to work out the rest. I may put it at four handred square miles; that is, o total of 1,000 square miles or a third of the district.
- 23. Q. That woold not obviate the necessity of famine relief being given in the remaining two-thirds. That

is all that could be dene P How about well irrigation !-Well irrigatioo seems to bring the cost up to such a tromendous amount.

24. Q. I see you want 128 lake to protect and of the district entirely, with one well for each ten acres for one thoosand soone miles. Evon supposing monsy was fortheoming, would it be possible to get n well for each ten acres in the district?—So far as unatural characteristics go, I should say quite possible.

25. Q. Do you consider that the famine work undertaken in the scarcity of 1896-07 was as a seful as could be devised?

—I think under the circomstances yes.

- 26. Q. If you had more time to think it ont, coold you have improved them?—The difficulty of famine relief work is in completing it. It would not be advised here to make a pain to a river and Isave the month open; you want to make a sinise to control it, oud if you go in for a very large prevision of pains, it means a lot of money for permanent improvemonts.
- 27. Q. Did you open ont pains largely?—There is e ecrtain umoont dane; I should like to see more dooe.
- 28. Q. Have you anything to do with the famion pragrammes?—Yes. I have got a large survey made recently for the improvement of a river, the Bya in this respect. I shoold like to have further surveys for suitable famine relief
- 29. Q. What is that ?—It is the Bya river in the south-west and sooth of the district.
- 30. Q. Thut would require a certain amount of expenditure on head-works?—Yes, coosiderable.

- 31. Q. It was in anticipation of famine?—Yes, whon Mr. G. W. Disney.
- 32. Q. But do you think these pains so valuable that you would like to see them started as works of importance before any famine was approhended?—Yes.
- 33. Q. What extent of country would they irrigats?— From the Bya river about two hundred square miles
- 34. Q. What other work was dons in the famine besides making reads?—A good number of tanks were dug.
- 35. Q. Would it be possible to replace all these works by so. W. Would it no possion to replace all these works by works useful for irrigation?—No; only a small proportion. The scotland area of a pain is so small that labour would be distributed plang it and would be on manageable.
- 36. Q. The country is not soited for ahars?—Yee, in Sitamarhi, where the grades are steeper.
- 37. Q. Are they suitable for famine works?-No, they are too small.
- 88. Q. (Mr. Rajaratna Mudaliar.)—Would zomindare be idelined to construct some of thess pains !— I caunot give you an opinion on that.
- 30. Q. Could the cutting that was made in the last famine, the Bagmatti Canal, be utilised for the completion of the work?—Yes, it is not filled up to any great extent.
- 40. Q What was the amount spent on that cutting in the famine?—Rs. 30,000 spent on work and Rs. 22,000 spent on the acquisition of land.
- 41. Q. So to that extent the cost of the work woold be reduced ?-Yes.

# WITNESS No. 33.-ME. M. H. MACEENZIE, Planter of Tirhoot.

- 1. Q. (The President.)—How long have you known this district?—I have been here about 25 years.
- 2. Q. What part do you know best ?- The Sitamarhi Sub-division.
- 3. Q. What schemes woold you advocate for helping it through another famine?—Where I am the Lakendai river ruas throughout the whole country, and there is a system of bunding the river at intervals; the overflow of the water is allowed to pass on to the land by means of small entires from the books to the river; and any coheme which would tend towards improving the existing arrangements would be practically all that is necessary.
- 4. Q. Is irrigation necessary for the crops?—In hardly any year do they do without irrigation to help on the rico
- 5. Q. Does the damming of the river create disputes among the zomindars and enlitivators?—No; the system is morty well recognised. But the bunding should be regulated, so that there lower down the river chould be given an umple sopply of water by passing it on. Encrmons masses of water rnn to waste in the chaurs at present. There should be side channels loid out with chauses.
- 6. Q. I suppose the present irrigators would claim vested rights. Prubably those at the upper end of the river get a far larger share of the water than those below fit is not so much what they use. There is ample water with a proper use of it. The Bagmatti with a proper scheme would give an ample supply right down through its whole course. its whole course.
- 7. Q. Would you allow new bunds and now pains?— It is difficult to soy what is now and what is old. A bund has always to be mode on a different site every year because the rush of woter securs away the eite.
- 8. Q. Is there enough water in the river for that ?-In a year like thie there would have been sufficient, but in the

- fumine year of 1896-97 the water was short. There was a Mr. M. H. bund in that year and there was opposition to criting it, Mackenzie. Above, too, there was not a full supply, because the water was ruu to 28 Oct. 02.
- 9. Q. Would you require a responsible overseer to be put in charge to see that the water was properly disposed of f—There would have to be some control.
- 10. Q. And a cortain amount of outloy. Would the district bear it?—A very light cess would cover the cost of such works as I propose.
- 11. Q. The general cooclusion in the Soran evidencs was that it would be desirable that the existing system of canals shoold be put into really good working order at the expense of the District Board by whom a leau would be made, and they would repay it by a cess?—No inoderate cess would be objected to if there was a corresponding benefit.
- 12. Q. (Mr. Muir-Mackenzie.)—Is the river sufficiently colloned at present !—In most places where it overflows they have thrown up banks: that is, on the
- 18. Q. (Mr. Allen.)—The bunds in the Lakaudai simply cot as weirs; the water passes over them ?—No.
- 14. Q. Well, whot happons to the lawer bunds? How do they got any water at oil?—That is whot I complain about, The water should run back into the river.
- 15. Q. Then so long as appor bunds last lower bunds got no water?—Practically.
- 16. Q. Bot if the Bagmattl were thrown into the Lakandal, what would be the effect?—If toe much wore thrown down, it would make the side channels still more essential.
- 17. Q. What would he the area that this Bagmetti schems would assist?—It would give a good supply of water to the whole length of the Lakendni.
- 18. Q. How many bunds are there in the Lakhandyo?-They vary ; seven or eight perhaps.

# WITNESS No. 34 .- Mn. ROWLAND HUDSON, Planter of Tirhoot.

- 1. Q. (The President.)—How long have you known this part of the country?—Since 1872 Tirhoot and Cham-
  - 2. Q. Is sugar much grown in Tirhoot !-- Yes.
- 3. Q. With well irrigation ?-As a rule, without irriga-
- 4. Q. I suppose it is essentially a crop which would be improved by steady irrigation?—Yes.
- 5. Q. Would the water be taken every year?—Almost every year unter should be used in February and March and probably up to July. 6. Q. Poes the success of the enterprise depend upon the introduction of irrigation?—No. Tirboot, Champeran,
- End introduction of irrigation r—Ro. Airmoot, Onamporan, Saran and Rungpur are the only districts in India in which sugareane can be saccessfully grown without irrigation. The land in the above districts retains its moisture, prob-

Mr. Rowland Hudson.

Ben.

Mr. Rowland Hudson 38 Out 08

- 7. Q. Would you advocate irrigation as a protection against famine?—Certainly.
- against famine f—Certainly.

  8. Q. What scheme would you propose f—The scheme proposed by Mr. Disney. He proposes putting claims in the existing bunds, which were made to prevent river flood water from running over the country in uncontrolled quantities. High ridges on the watershod should also he ant through and coluices put in the authings. The offset would be preciselly unlimited. If you get water in one chaur by cutting through a narrow ridge, you may get it into another from it by the same process and so on. This in itself would do a great deal af good, but I think it should be supplemented by a scheme to raise the level of the rivers in dry seasons ceveral feet. The ordinary bunds made for this purpose are open to the objections that they are swept away in flood time, and are very aften the cause of disputes. Falling weirs would be permanent and much more effectual.
- 9. Q. Would you want to raise the beds of the rivers?-Na.
- 10. Have you any idea where this is to be done?—In the little Gandak running right through Champaran and Tirhoot it would do a great deal of good, and in many amaller rivers nearer to the Nepal frontier.
- 11. Q. It would be an expensive work?—Yes, but it would be an insurance against having to spend an enormona amount to save the people in the event of a famine.
- 12. These woirs would necessarily he accompanied by distributary channels?—That would be o small motter. Existing water channels, which are empty in the dry season, could be utilised in many places.
- 13. Q. Would the people take water every year?—I think so. The average rainfall is about 45 inches, but a great deal depends on whether it is seasonable or not.

sbly owing to ito proximity to the hills. Irrigation will
give an increese in the yield.

7. Q. Would you advocate irrigation as a protection against famine?—Certainly.

14. Q. It would make this difference that if money were laid out upon these schemes out of the existing local funds of the district, if they take water every year, a water rate can be put on?—Then it would be necessary to measure the water, and that would be necessary to measure the water, and that would be necessary to measure the water, and the would be necessary to measure the water, and the would be necessary to measure the water, and the would make this difference that if money were laid out upon these schemes out of the existing local funds of the district, if they take water every year, a water rate can be put on?—Then it would be necessary to measure the water, and the would make this difference that if money were laid out upon these schemes out of the existing local funds of the district, if they take water every year, a water rate can be put on?—Then it would be necessary to measure the water, and the would make this difference that if money were laid out upon these schemes out of the existing local funds of the district, if they take water every year, a water rate can be put on?—Then it would be necessary to measure the water, and the would make the water water water and the would make the water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water water wa

- 15. Q. Would not a cess create opposition?—I think it would be difficult to levy a cess which would be relatively fair. Raynts in certain areas would have to be assessed at similar rates, and some of them would derive more hencit from the solumn than others. For example, a rayat with a large holding would nay, eay, one rupee a year; owing to the position of his bolding he will be benefited to a great extent. The effect of the increase of the produce of his holding would be to lesson the value of the produce of a rayat who is loss fortunate in the position of his bolding and wha would derive little or no benefit from the scheme, while the latter would also have to pay hie water rate of one rapes. I should be inclined to carry ant the scheme as an insurance against famina and out of the funds of the Imperial Treasury. We have a population of a thousand to the square miles here, and it would take a great deal of money to save the people in a famine year. I do not say that it would not be possible to levy u cess for up-keep; that would be infinitesimal, and I think cheerfully paid.
  - 16. Q. Would sugarcane growers pay rateo?-Yes. ,
- 17. Q. How much per acre?—I cannot eay. Probably Rs. 5 or Rs. 6 for mesenred water.
- 18. Q. (Mr. Muir-Mackenzie.)—In the neighbaur-cod of Poona we demend Rs. 50. But then you enlivate bood of Poons we demend Rs. 50. very highly and get a very lerge outturn.
- 19. Q. What do yau get por acre?—From the smaller varieties about 12 tens and from the larger from 15 to 25.
- 20. Q. (The President.)—Would you causidor the advantage of irrigation F If canals were made, would you be inclined to grow sugar in the districts which would be irrigated by them, say, in Champaran P.—No. I would not. Others might do so. I must work the praperties in which I am interested. The country which would be benefited by the Tribeni Canal is essentially a rice country.

1. Q. (The President.)—You have seen this district in time of scarcity?—Yes.

2. Q. What is the best policy to prevent the evil effects of famine?—Improved irrigation.

- 3. Q. How?—The lands in this district are of different inde. Some are benefited by irrigation and some do not kinds. Some are benefited by irrigation and some do not require it. If the irrigation is taken over by the district officer, so that people living along all parts of it are equally benefited, that part of the country will be quite sufficiently irrigated by the present sources. And where we have not got sources of irrigation, by excavating the tanks it will be sufficient, and a small tax will be required to be realised from the product of the small cost from those interested and that will pay far the small cost.
- 4. Q. Would you like to eet the Government make more points? Yes; sometimes pains are necessary and with sinies gates, because otherwise one man gets all the benefit of a bund. That is where we want control.
- Q. Who is to exercise that aentral?—The district officer. But any big echeme is not desirable.
- 6. Q. Da you know the Bagmatti ochemo?—Yes. I think any more water rushing from a very hig river ta n river of a narrow channel will be sometimes very dangerons. It may da good in some years when there is no water in the river, but in some years it will be difficult to pass so much water. water.
- 7. Q. Would you tax each particular pain?-Yes-
- 8. Q. (Mr. Muir-Mackenzie.)—le thore any room for the extension at well irrigation?—A good deal more might

WITHESS No. 85.—BABU BISHWA NATH, Zamindar and Indigo Planter, Muzaffarpur,

be done with Government advances returnable at ten or fifteen years; also for tanks.

9. Q. Are the tanks used for irrigation?-To some

10. Q. (Mr. Rajaratna Mudaliar.)—Are the people anxious to take leans, and is there any difficulty in getting them?—Yes, they cannot get from private persons; and there is delay in getting leans from Gaverament. Some special forms should be laid dawn for an officer far realising ned distributing the amount by the officer going to the village himself and getting the lean from the man who ewes it. Sending a chaprasi increases the burden of the lean.

11. Q. Do you think the district officer might advantageously dishurs a loans on the spot P-Yos.

K.

12. Q. Would zamindars be able to disburse loans?-The Deputy Collectors will do it better than the ramindars.

13. Q. Are there any pains in your zamiadarl?—Yos some private ones; but up to this time nono made specially for the benefit of the rayats.

14. Q. Is the nakdi system in force in your ramindari?—
Yes, and in taxation particular attention should be paid to
the fact. In a fixed area held on a fixed rent; if it yields a
better crop, we do nat get anything more; and if the cess is
levied on revenue like the ambankment cess, we shall have to pay for the benefit derived by those rayats.

15. Q. Don't they pay balf?-They should.

16. Q. But suppose you execute improvements you have the power to enhance the rent P-It is hedged round with forms and restrictions.

Nath.

28 Oct. 02.

Mr. A T. 1. Q. (The President.)—You are Sub-Deputy Opium Christian. Agent in this district ?—Yes.

2. Q. In the whole of Tirhoot ?—Yes, Muzassarpar and Durbhauga.

- 3. Q. That entails your travelling about a great deal among the people, and so you have been able to see their wants?—Yes.
  - 4. Q. Have you been long in this district?-Since 1896

'5. Q. Were you here during the famine of 1896-97 !

6. Q. De you find any strong desire expressed for arti-ficial irrigation bere ?—In certain parts of the district heiai irrigation bere?—In certain parts of the distinct where they irrigate they are very auxious to get well advances for the irrigation, but in other parts of the dis-trict they do not irrigate and depend on streams and ahars for irrigation; there they do not ask for well advances.

80575

- 7. Q. If it were possible to introduce into this district an irrigation system, such as the Souc Canul, do you think the people would pay for it?—It would ull depend on what they had to puy. If it was u small amount, I dare say they would willingly pay it and utilise the water.
- 8. Q. In places where they do not irrigate ?—In some places I have introduced irrigation, and once they have taken to it they have kept on irrigation.
- 9. Q. Was that irrigation by wells P-Yes, we give advances for wells.
- advances for wells.

  10. Q. You have done this on a very large scale; have you not P—Not on a very large scale always. The two reasons I gave rather largely were in 1896-97 and last year. In 1896-97, which was a dry year, I gave advances for 161 pakka wells, 41 old wells repaired and 1,254 kacheha wells. For all that R. 12,406 wers given. The next year 1897-98 we gave advances for 110 new wells, 26 old wells repaired and six kacheha wells only. Altogether Rs. 5,242 were given in this way. Last year we gave advances for 56 new wells constructed, 113 old wells repaired and 931t kacheha wells. The total amount given was Rs. 7,879.
- 11. Q. When you give an advance for a well it is coupled with the condition that the man who takes the coupled with the condition that the man who was the money will grow a certain amount of opium-pappy ?—Yes; we only give advances to poppy ould rators. Some of thom engage to give a little extra area semetimes Suppose a man's well falls in and his well is made for irrigating poppy os well as other crops, then we give him an advance.

. }

,1

ł

ij

- 12. Q. Doce he confine himself to poppy or does he grow 12. Q. Doee no conine himself to poppy or does he grow other crops P—Ho grows other crops and he uses the well as well for the other crops. We generally give an advance to three or four cultivators together. They always use one well among three or four men, or somstimes more, according to the situation of the well. In Tirhoot they can irrigate about 10 acres round about one well, but not everywhere. In companions that cannot irrigate about 10 acres round about one well, but not everywhere. where. In some places they cannot irrigate more than two or three acres; but where they do not require much water, only one or two waterings for the whole season, they can irrigate more. irrigate more.
  - 13. Q. Have you been troubled with these wells running dry !—They very often run dry, and that is how we give advances for despening wells.
- 14. Q. Do they deepon very freely?—That ogain depends. In certain parts they can do it freely, but in other parts where they have got quicksinds below the surface, they require appliances to go through it. In some places they can sink them very easily.
- 15. Q. What does it cost P-Our average cost is about Rs. 50 to 60 per well.
- 16. Q. Ie that the amount for a masonry well P—Well, it is not quite a masonry well. They simply use burnt bricks and they do not use any mortar. If they use mortar a well costs about Rs. 260. For the purposes of irrigation they have usually these inexpensive wells.
- 17. Q. (Mr. Muir Mackenzie.)—What is the usual depth to the water source?—That also varies very much, but the average depth is from 20 to 40 feet.
- bat the average depth is from 20 to 40 feet.

  18. Q. (The President.)—De they grow poppy without irrigation P—Yes, we have got about 30,000 bighas here, and ont of that we have a little less than & irriganted; the rest, say about 10,000 bighas, is unirrigated. The proper area for this year is 28,600—about 17,000 acres. The total area altogether irrigated is about 8,000 acres and the rest is unirrigated. Out of the unirrigated area, however, although we call them unirrigated, they use water from the different streams, whonever they can get it. For instance, in the Madhubani Sub-division, although the callivation is called nuirrigated, they manage to get water every year in the mannual ope-airsion, although the califyration is called nuirrigated, they manage to get water every year nearly from some streams. 8,000 bights are irrigated from wells; some of the other is not irrigated at all, and the rest is irrigated from streams, tanks and chaure.
- 19. Q. Where they have wells do they use them freely overy season P—In the parts we call irrigated cultivation they use them overy year whether there is rainfall or not.
- 20. Q. With your knowledge of the district bave you may suggestions to make as to how we might be better prepared for famine in Tirhoot ?—I think we can improve well irrigation, and as regards the irrigation from streams, I had a talk with Mr. Mackenzie, and his proposal is exactly what I suggest, viz., the hunding up of the streams and giving water from gaine, chause, etc. water from pains, chaurs, oto.
- 21. Q. There is a great deal of that as it is ?-Yes. In fact. I think quite six or seven thousand bighas of the un-irrigated laud are irrigated by the last means.

- 22. Q. (Mr. Muir-Mackenzie.)—The granting of nd. Mr. A. T. vacces for wells is by no means your only business ?—No. Christian. That is only one part of it.
- 23. Q. Da you generally give your opinm advances to tenants ?—Yrs, to all sorts of people : not only to occupancy tenants, but to any man who is brought forward as a gennine oultivator.
- 24. Q. What is the security. P—Generally there is a middleman or hathidar who bringe about 20 or 30 cultivators. These cultivators come to us jointly and suy they want advances and we give it to them on their joint personal
- 25. Q. You don't take lunds as scenrity ?-Only in cases of well advances. Then we take immoveable property as
- 26. Q. Do you always take immercable property in cases of well advances?—Generally. There are special cases where three or four men come to us for advances and wo give it to them on their joint scenrity if they are good coltivators.
- 27. Q. Mr. Tytler employed that combination principle a great deal?—Yos, he used to do so mere, because he had more occupancy tenunts there, and there are more permanent cultivators in his district. We cannot do here that, because in dry seasons our cultivation fluctuates a great
- 28. Q. (The President.)—What brings it down in a dry season? Is it want of min?—Yes.
- 29. Q. Cunnot wells replace the min ?-Generally the wells have a sufficient supply of water, but it is in places where there are no wells that the difficulty is felt, and they do not generally sink wells or construct wells here in places where they are not used to making wells. In some places ugain there are difficulties such as quicksands which caunot be got over. In other places they are no used to irrigation, and they have an idea that if they irrigate once, they will always have to irrigate. In some places again the cost is too much.
- 30. Q. What is the period for repayments of leans?—Within two and a half years from the date we advance thom the money.
- S1. Q. Do they never ask for any longer periods P— Sometimes they do. Last year in several cases people asked for time and we gave them another six months and in rare cases we have given a year's time.
- 32. Q. Do you have any difficulty as regards repayent?—No. Failnres to recover advances are very few and we very seldom have recourse to law.
- 83. Q. De you think, if you allowed people a longer period to ropay, they would be more forward in applying for advances P—I dare say they would; but so for as our department is concerned, we do not want to make money arrangements of that sort.
- 34. Q. What rate of interest de you charge?-No inter-
- 85. Q. Whon is a man's instalment paid? How soon effor the advance to him?—A man to whom we advanced mency this season will not pay back his first instalment till April 1804. Then the second instalment will fall due in September 1904 and the third one in April 1805. Ho pays back the money in three iestulments, but then he does not have to pay back anything for one year.
- 36. Q. That gives him time to make his well and grow his orope ?-Yes.
- 97. Q. I gather you have not succeeded in making wells popular in tracts where they need to be comparatively nn-known before P-No. In parts of Durbhanga close to Samsstipur we got a few cultivators to try. Where they did try and made wells, they kept to irrigation, but it is very difficult to get people to take to it in new places.
- SS. Q. In Samastipur has it epread in consequence of the action you have taken?—No. In only about 20 villeges irrigation is used.
- 39. Q. In consequence of that has the example been copied?—No. There are only 20 villages to which it has been extended, but not more. That is nothing very much
- 40. Q. Does well irrigation largely increase the yield of poppy?—Yes, it increases the yield much more than canal water does, I think, generally. That ugain all depende upon soil. In some places canal water does, but in places where the well water is brackish and soil indifferent, well water is more beneficial. Close about Hajipur they may

28 Oct. 02.

Mr. A. T. Christian

28 Oct. 02.

have rain, but until they irrigate from wells they do not get a good crop of pappy ar anything class: no garden pro-

- 41. Q. I suppose there is a great deal of manure used ?—Yes, in poppy.
- 42. Q. Do you find that where you have encouraged well irrigation they generolly get sufficient water far all operations from the sawing to the finish?—Usually they da, but there are some places where wells run dry. Some of these they can deapen and others they cannot, and so they have to da the heat they con with their scouty supply.
- 43. Q. Same witnesses have said that when wells are dag you may get enough water far late watering of the crop, but that you connet rely upon wells at crapping time?—That is the case in several villages. In irrigated tracts, a few miles santh of Muzasserpur, we have only get to go 20 feet and we can get a sufficient supply of water all the year round.
- 44. Q. And yet irrigation has not vary much extended in that part?—In every village overy hit of land is irrigated there.
- 45. Q. Is it your business ta press the people to take well advances? Are you ancoaraged ta press the people to take well advances?—No. They come of their own necard. We try and encarage well advances by encoareging them to came to us when they want them. We ga to a village and see a well aut af repair and we ask tha man if he wonts my help, but there is no need to personale them at all. If they were pressed, they might not spend all the money in making wells.
- 46. Q. Does the smannt advanced yearly vary very much? Are the number of applications the same, or are they very much increased by the amount of stimulus given by individual officers?—I think a great deal depends on the year. In the two dry years I had very many more applications then in other years. In years when they have a good reinfall people do not think of moking new wells or repairing their aid ones.
- 47. Q. Have you ever found your allotments insufficient?—In these two dry years I have had to nek for further canetion.
- 49. Q. Have you always been able to get your forther sanction ?—Yes. In 1897 I had to mak far three times the amount which was first allotted to me, which was Rs. 4,000.
- 49. Q You could not have get rid of any mere profitably that year? —I distributed it among poppy cultivators. I date say, if I were to have advanced to ather cultivators, we cauld have get rid of more. But we only restrict ourselves to pappy cultivators.
- 50. Q. You have had a lot af experience in advancing to cultivators. If you ware emplayed to advance to ather cultivators, dou't you think you would get rid of a lot more money P—Yes. The peaple seem to have more confidence in us. They have not get to go through a lot formality. In special cases they come and apply to us and any molurair makes enquiries when we ear in camp and we pass through these villages, and the advance can be given within three or four days of the application.
- 51. Q. Ynn are combled to give advances very promptly?
- -Yes.

  52. Q. Dn yon carry tho money about with you?—
  In seasons of draught wa do. As a rule, however, we first make enquiries. All applications are given in July, Angust and September. Nevember to Junuary is the time we make all our enquiries. In Jonnory we pay nur first instalment and then we go an making enquiries and mare advances are paid in March. Then we have get to pay thom a second instalment. We do not pay all in an instalment. We pay the first instalment, and then when the man commences working we pay him his second instalment and their d when they are about finishing.

  52. Q. Who case short inspecting the work?—I inspecting
- 53. Q. Who goes abant inspecting the work?—I inspect in the naid weather and my two ossistants also inspect in the cold weather and anr native staff makes enquiries abant the security. These scourity enquiries naturally occupy about three or four days. There is very little difficulty about

security. The men are generally truthful, and thought does happen sametimes that we come across a dishanest man, my experience is that they are fairly haacst, and they knew that if they deceive us once they will never be able to show their faces to us agolu. I have recovered every pies at the advances with the acception of the instalments still due and for which the periods have been extended. We have seldom to have recourse to law to collect our money. They know that if they pay up promptly, they will get advances ugalu when they want tham.

54. Q. They do not aften ask you for a postpanement of payment af instalments?—They dan't ask very aften accept when there is a dry season ar when there is a bad season far apium.

55. Q. Do you grant it?—Generally it is granted. Of course up to a year it is usually granted, but if it goes beyand, we get the Opium Agent's sanction.

(Witness again described haw men came to him for advances, and after enquiries had been mude by his staff they made a report to him an which he again made angulries.)

- 50. Q. (Mr. Muir-Mackensie.)—I dan't see from all yan have said how your advances are given within three or four days of the upplication?—That is, when a special mon comes and says his well requires rapelts, I go' and inspect it and give him an advance. These are special cases. What I have described is the usual pracedure. When a man has got the time he follows the usual pracedure. In special cases there is nothing to provent him making his application at any time during the cold weather.
- 57. Q. Then yau can manage to get all your enquiry done in three or four days ?-Yes, in argent cases.
- 58. Q. (Mr. Rajaratna Mudalian)—Yon soid that the cultivators come to you for advances overy year ?—Yes.
- 50. Q. Then there applications are prahably chiefly for the expenses at cultivation and not for wells ?—That is for cultivation entirely. That has nothing to do with wells. Wells are entirely a separate department.
- 60. Q. What proportion of advances go for cultivation and what proportion to wells?—Advances are all far enlitivation. There are special men who want to sink wells. I have 70,000 cultivators. Out of these 200 or 300 ar 400 may apply far well advances.
- 61. Q. The advances are repayable within two or three years?—Opium advances are paid from the produce next agason.
- 62. Q You spoke of middle-men bringing up a number of coltivators. Who are these middle-men f—They are themselves caltivators. They are a little better off than all the other enlivators. The caltivators themselves select these men in represent them and bring them up, and we depend an these middle-men far information as ta whether a particular caltivator should be trusted or not.
- 69. Q. Don't you think that these cultivators will be at the mercy at the middle-men. For the favourable recommendation that these middle-men gire to the athers they might probably expect some remnasmion from the others?—There are rates fixed far these men at eight annas a bigha. They cannot demand more.
- 6i. Q. Does a middle-man nadertake any responsibility?—He slong with the others. Ha is to a certain extent responsible that these men are salvent and that they are genuine coltivators, but the responsibility is for everyone under tha license.
- 65. Q. (Mr. Muir-Movkenzie.)—Is it essential that a man should have a middle-man's recommendation before he can get ndvances for wells ?—Not always. Sometimes, if wo know men are solvent and have proporty, we give them advances quite independently at middle-men. Very after ramindars apply for well advonces. Some months back we gave an indigo plonter, Mr. Severs, of Murpa Fastory, its. 210 for 70 kochcha wells.
- 66. Q. You realise the odrances for cultivation before the opinm crop is removed f—We weigh the upium, dedact ndvances and pay them.

Wirness No. 37.—Me. T. Burten, Superintending Engineor, Muzastarpur.
(Replies to printed questions.)

Mr. T. Butler. 28 Oct. 02.

I.—Theireport refers to North Bihur comprising the districts of Champaran, Tirhuci, Durhhunga and Saran. I was emplayed an surveye for canals in North Chemparan

far six months in 1897, and have been Inspector of Works in these districts since March 1898.

North Bihar, as regords irrigation questions, may be divided into two parts, viz .-

- (a) The submontane tract comprising that portion of Champaran north of the Sokrana or Boor Gandsk river, and that portion of the Tirhoot and Darbhunga districts 15 to 20 miles south of the Napel houndary.
- (b) That portion of North Bihar south of the anbmontane section.

In (a) the soil is either sandy olay, or elay locally termed bhangar" for n depth of 2 or 3 fest, below which is sand. This soil does not retain moisture, and hence requires plentiful rain or irrigation to produce good crops.

Rice is the crop chiefly cultivated in this tract.

In (b) the soil is chiefly a white learn, very retautive of moisture, and, when enlitivated, the moisture rises to the surface. Indian-corn, indigo and rabi are the orops chiefly cultivated. Rice is grown only in the low lands or chaurs on which more or less water remains in ordinary Years throughout the rainy season.

II,-The average annual rainfall is-

(a) 60 inches.

(b) 48 n

but the value of the rainfall to the crops depends not so much on the total amount of min that falls during the year as to whather it falls at a sultable time for the crops.

rops.

III.—In (a) the only existing canal is a small one, 6 miles in length, named the Madhinan; but the water from the numerous bill streams which cross this tract is utilized by the cultivators by means of small inundation channels locally called pains, and when the supply in the streams falls at the end of the rainy season, earther dams are often canetructed in them to supply water through the pains. Most of these otreams spill over their banks in high flood, and submerge the country on both sides; but as the slope and submerge the country on both sides; but as the slope of the country is from 4 to 6 feet per mile, the flood-water nenally passes off quickly and is beneficial to the kharif

Early in October when the rain ceases or when there is any considerable break in the rains, the supply is most of these hill streams falls very low or dries up altogether, as most of them are bunded in Nepal territory, the only exceptions being the Gandak, Bagmutt and Kumla which hove a considerable supply throughout the year.

In this tract, when the supply of water is sufficient, magnificent rice crops are obtained, and the only obstacle to irrigation is the nacertainty of emply if the water is taken from the smaller streams, and the lack of funds to construct schemes from the larger rivers.

Two canals are now hoing constracted by Government, viz., the Triheni Canal taking off from the Gandok river to irrigate 50,000 acres of rice in North-West Champaran, the length of the main canal to be 60 miles, and the Dhaka Canol taking off from the Lal Brackoye river to irrigate 15,000 acres of rice in north-east of Champaran, the length of the main canals being 19 miles.

Preliminary investigations have also been made for several smaller canals.

In (b) the only canale are these in the north-west of Saran which were constructed about twenty years ago. They consist of 4 sluices in the flood embaukment on the right of the Gandak river. These sluices are applied from a sofa of the Gandak river which rens porallel and close to the field embankment. The sluices discharge into four natural nullshs which extend to the west and south of the district.

During the flood season an ample supply can be obtained through these sinices, but there are no means of distributing it from the nullahs. After the flood season, n supply can be obtained through these sinices by making carthen dams in the sola. These canals have proved a failure chiefly on account of the uncortainty of the supply and the want of means of distributing and controlling the sapply in the

Irrigation is required only in an unusually dry year or when the hatia rains fail, and in the latter case the level in the sate is often too low to send a supply through the sluices without constructing an earthen dam, and such a dam cannot be constructed till the discharge of the sota has reduced, and it is then too late to irrigate the rice crop.

VII.—There are as yst ue canals of continuous flow in North Bibsr. The Madhuban Canal cannot be classed under this head, as the discharge of the river Tenr which supplies it falls very low when the rains cease.

XII .- The Madhaban Canal takes off from the Tour ever just helow the Nepal frontier. There is a masonry weir in the river and head sluice and bridges on the cans! which is only 6 miles long.

There are no distributies, only some small villoge channels constructed by the cultivators. If sultable distributing channels and regulotors were constructed, the area that could be irrigated would be considerably extended. At present the water flows as hest it can from field to field, and has to be litted on to the higher-lands, and there is a considerable weater. The Tenr river is a bill residue from Napal, and the fixed rice and fall rapidly, and stream from Nepal, and the foods rise and fall rapidly, and after the 15th Ootober the discharge is small, and in a dry year is not more than 50 cabia feet per second; hat in a year of ordinary rainfall the supply during the kšariji season is sufficient to irrigate all the area commanded by

XIII.—Rice is grown on the greater part of the area commended by the esnal, and in years of scanty minfall the produces from the fully-irrigated crop is double that from the unirrigated crop.

XV.—There are several tanks in the area from which in a dry year the onliveatore lift the water for irrigation of the rice crop, but this seems of supply is seen exhausted.

XVIL-No water-rates are levied for irrigation from At 11.—No water-rates are lovied for irrigation from this canal owing to some faulty agreement with the zamindor when the canal was constructed, and the cost of mointoining the canal is home by Government. If suitable distributing chonnels and regulators were constructed by Government, it would probably be possible to realise sufficient water-rates to cover the cost of maintaining the

The Saran Canals, which were constructed about twenty years age, were for ten years worked under a guarantse from the planters of the district, who paid a lump sum yearly and were ullewed to realise from the cultivators what water-rates they could under the rules. They found it, however, impossible to realise a moiety of these water and the paid of the water, and home rates owing to want of control ever the water, and hones did not renew the guarantee, and the canals remained closed for several years. In 1896-97, and again in 1900 and in convent year the canols were, at the request of the Civil antherities, with the idea of mitigating the impending scarcity, opened at the end of the kharif senson, no charge with the invention from them. being made for the irrigation from them. The area irrigated was, however, small.

Full details regarding the Tribeni and Dhaka Canals, now ander construction, are given in the reports which accompany these projects.

These, with the Madhubau Canal and two small canals proposed from the Telawge and Pussa rivers, would irrigate the whole of that pertien of the Champaran district which requires irrigation, except a small strip north of the Triboni Canal, which must depend for Irrigation on the pains taking off from the bill streams. These pains would be much more useful If they ware hetter allowed and exercisbe much more useful if they were hetter aligned and previded with head cluices. The supply from those hill streams, though small in a year of drought, would probably he sufficient to irrigate the greater part of this area.

Note on the proposal made by Sir Thomas Higham, Secretary to Government of India, to increase the capacity of the syphons on Tribeni Canal.

Sir Thomas Higham proposed to increase the width of each vent of the syphons from 6 to 8 feet.

There are to be six such syphons on the caush viz .-

	M		ft.		
Chota Bhu	bsa at 1	١.	. 1,420	with 10	vents.
Bara Bhuh	ea nt 19		. 1,500	,, 10	12
Masan	at 3		. 1,580	, 8	31
Hurbora	at 41	3.	3,720	,, 7	91
Pandoyo	ot di	3 .	. 2,560	,, 7	\$3
Moneari	at 5	. 8	4,240	,, 6	17

Mad eluice .- The head sluice will have 22 vents each N'XA'.

There will be khnrriss in front of the vents so as to take off water from the serfoce enly.

T. Butler.

28 Oct. 02.

Mr. T. Butler. 28 Oct. 02. It was calculated that a depth of 23 feet over the khurries would give a discharge of 2,028 cusees, and that with this discharge the velocity through the sluies vents would be 3.85 feet per second. By increasing the depth over the khurries to 3 feet, a discharge of obout 2,500 onhit fee could be obtained. The difference of the level of the river and full supply in canal heing in October about 2 feet.

Syphons.—The vents of the syphons were designed 6 feet wide and 6 feet high from floor to arown; the arch subtending an angle of 60°. The height of the Manaari syphon was to be 63 feet.

The area of such e vent 6 feet would be 3,411 square feet. It was assumed by the Chief Engineer, Mr. Buckley, that the head at the syphon would give a meen velocity through the vents of 7 feet per second.

The discharge through the syphons would therefore ho-

Chota Bhubsa 10 × 3,444 × 7=2,410 cusocs 2,160
Bara Bhubsa 10 × 3,444 × 7=2,410 ,, 2,109
Mesau 8 × 3,441 × 7=1,028 ,, 1,670
Hurbora 7 × 3,414 × 7=1,687 ,, 1,207
Pondeyo 7 × 3,414 × 7=1,687 ,, 920
Maneari 6 × 3,744 × 7=1,572 ,, 780

The discharge required below each syphon to irrigate the cammanded area of rice on the caual and its proposed extension taken at 200 aeres per square mile is printed in italio figures. When the original design was prepared the relocity through the last 8 syphons was calculated at only 6 feet per second, and this would reduce the discharge through the Hurborn and Pandoye to 1,416 encess and through the Maneari to 1,318 exsecs.

The discharge through the syphona after allowing for the irrigation of 200 acres per equare mile with a duty of 50 acres per oused on the Tribeni and its proposed extension would therefore give a curplus of—

Chota Bhubea			260	curees.
Bara Bhubsa			301	1)
Masan	•		358	10
Hurbora			239	7)
Pandoyo			526	17
Maneari .			568	

This surplus discharge would be sufficient for irrigating the area to the east of the present proposed terminus of the extension, viz., the Tellays river provided that the two assumptions, viz., that the area of rice requiring irrigation will not exceed 200 acres per square mile, and that there will be a velocity of 7 fest per second through the first 3 syphons and 6 feet through the letter 3 prove correct. There are 16 aqueduets over other streams besides the above syphons; the width of the aqueduets and their discharges are given in the annexed table:—

Serial No.		Width.	Dischargo.	Volocity.	Whon onlarged velocity in canal.		Increased discharge with same volcater if depth was increased 6 inches.

The italia figures show where the syphons come in.

From the above it will be seen that there must be a small afflux at each aqueduct to increase the velocity from that in the abannel to that required to carry the discharge through the aqueduct, as the difference of coefficient between a masonry rectangular and a trapezoidel earthen channel will not give the necessary increase in velocity. To increase the discharge through the aqueducts by another 150 enbic fect without increasing the velocity, it would be necessary to widen those below No. 6, from 1 to 5 ft. The bridges up to aqueduct No. 8 are designed with 10 spans of 8 ft., so that the sectional area of the waterway would be 10 × 8×7=560 sq. ft. and the velocity required to give the full discharge would be from 4 to 3 ft. per second, and this will require a small afflux. If the depth of water was increased by 6 inches, the discharging capacity of the bridge would, without increasing the velocity, be increased from 160 to 150 per second. The waterway of the channel itself is designed when increased to carry supply from the proposed extension to be as follows:—

Reach.		Bed.	Width slops over 1,000.	Depth	Velo- aity.	Dis- chargo,	Dis- chargo with depth in- creased 6".

Œ.

By increasing the depth by 6 inches and making the last two reaches which have not yet been excavated a little wider the canal would discharge an extra 200 cusecs. The hanks are new constructed to 3 feet above full supply, but a margin of 2½ feet would not be dangerons. To increase the discharging eapacity of the cannl by another 150 to 200 cusecs, it would be necessary to widen the aqueducta from No. 7 to the end and raise the water level 6 inches and to increase slightly the width of the channel on the last two reaches and to and another vent to the bridges below aqueduct No. 10.

- 1. Q. (The President.)—You have heard what the various witaesses.—Mr. Growso, Mr. Hodding and others—have said obout the Saraa Canal. Do you generally ogree with them?—No. Their premises were all wroag. The supply of water available is very uncortain; the canals are oaly so-called canals; they are more inundation canals than anything else. They consist of sluices in the flood embankment of the Gandak river with short channels londing from a sota of the river with short channels londing from a sota of the river to the sluices and short channels from the sluices to old spill channels of the Gandok. Whenever there is a supply in the sota during the flood seesoon you can get water through the sluices.

  2. Q. Is there not always a supply in the flood sca-
- 2. Q. Is there not always a supply in the flood scason?—Not always. Generally between the 15th of
  June and the 15th of September you can get in what
  supply is wanted. After the 15th of September the
  flood is most uncertain. If you have a late flood, then
  you can get a supply; if you have not, then although
  there may be an ample supply, the level is too low to
  get it through the sluices.
- 3. Q. Have the silices get their sills too high?—You could not make the sills any lower. You cannot keep the clannels even to the level of the sills. They silt up. The first two or three miles of the canol silt up. almost at onco. There is almost no slope for the first two miles inside the sluices.
- 4. Q. Whot slope is that?—I do not think there is a slope of nn inch a mile for the first two miles. The bed is practically horizontal.
- 5. Q. What is about the slope across the Saran District?—It is about a foot to a foot and a half a mile.
- 6. Q. Then the uncertainty nhout the supply is not the time they want the water the most in the hathia time?—They want it then for irrigating the rice crops in the chaurs, and os described by the other witnesses a plentiful supply of water and not o mere sprinkling is essential for the rabi crops in a dry year.
- 7. Q. Could you not put in strong spurs that would force in the supply?—These would chonge the direction of the sola. The land on both sides is alluvial land (explains on the map).
- tion of the sota. The land on both sides is alluvial land (explains on the map).

  8. Q. At present the water goes where it will. Supposing now that the villagers agree to pay a two piecess, that will produce its. 50,000. Then what are the engineering points?—With that amount you could not do anything to give them a certain supply, and as it is they have an uncertain supply now without going to any expenditure. Even that uncertain supply would tide them ever their difficulties generally. It think any mency spent except in improving the distribution of the water would be money thrown away practically. It will cost a great deal of money to do what you suggest. The rivers which form the cannes are flooded by drainage water in the rainy season. To pass off this drainage and at the same time have means of raising the water level, it would be necessary to construct masonry regulators. Earthen cross bunds with small bye-washes would obstruct the drainage of the country. On the other hand, a moderate expenditure on the distribution inside would meet the enso except, say, in one bad year in 25. I think there is a general impression that the Public Works Department acted in a dog in the manger fashion in regard to these ennals. They would not open them, because originally the people of the district agreed to pay the canals were not opened till last year when the original water in the proposed to pay the canals were not opened till last year when the original water in the proposed to save them from famine. Whenever that cry was raised they were opened free of charge, but as there were interest.

  9. Q. What is the most reasonable thing to de for the futures.—We have not got enough benefit from
- 9. Q. What is the most reasonable thing to do for the future?—We have not get enough benefit from the existing scheme. The existing scheme would give more benefit, if it were settled that we should not charge any rate but to distribute the water as best we can with the help of some money spent on the regulators and channels inside.
- 10. Q. You say that water oan be given except in one year out of 25?—I don't think in a dry hathia we could give them water for the area that they mention. I think we could only do between 20,000 and 40,000 acres, and that only if they took the water before the hathia.
- .11. Q. These witnesses talked to-day about an exenditure of three lokhs?—I do not know where they got their figures from. They have got no irrigotion officer that they could have consulted. I don't think they asked the Chief Engineer or anybody.
- 12. Q. (Sir Thomas Higham.)—Do the channels silt up?—For the first two feet above the sills of the sluices they silt up very rapidly. Above that silting

- does not take place if you do not open the sluico during the high floods. They do not, as a rule, want it open during the high floods.
- 13. Q. Do you have to spend much money on clearing the silt?—None has been spent during the lost four or five yoors. They spent Rs. 40,000 in one year when the canal was guaranteed, but that was too
- 14. Q. What do you suppose would be a fair maintenances charge, supposing it were to be under an ongineer and done reasonably?—Rs. 10,000 a year. Rs. 40,000 was what they spent when the planters gave a guarantee.
- 15. Q. What was the amount of the guarantee?—
  41 per cent. on the copitel cost. I forget the exact amount. It was long before my time. Later on Rs. 21,000 was the amount of guarantee.
- 16. Q. That Rs. 40,000 was spent by the Department?—Yes. They used to spend a lot of money in trying to make cross bunds in the sota.
- trying to make cross bunds in the sota.

  17. Q. (The President.)—I don't think that anything that you have said is really against what these gentlemon advanced this morning. You nro merely showing what they perhaps did not realise—the uncertainties of the supply?—I ogree with nearly everything that was said, except their promises. Mr. Filgote's proposal meets the facts of the case. If you had ents from these rivers into the chaurs and filled them up, it is really all that they want to save the country from searcity, and in addition to this, if they had smaller cuts from all the sluices in the embankment, they would irrigate a very large area of rice. There are 30 to 35 sluices down the embankment, and those sluices now are opened at the request of the cultivators, provided nobody raises an objection. If anybody raises an objection, the Collector has to decide it. By the time the decision is arrived at it is generally too into. Where there is no channel to lead the water from the sluices they are a source of frequent complaint. If water is passed through them, it flows over the adjacent lands causing damage to some lands and benefit to others.

  18. Q. How long would these channels require to
- 18. Q. How long would these channels require to be?—A very short length some of them; none of them would be over a mile. They only want to go into the nonrest chour and then the water finds its way from chang to chan all over the cauntry. If you wanted to spend money for famine protection, I think you would get more protection in spending it in that way than almost any other.
- 19. Q. Could you now tell us about the Tribeni Canal? Could you show us a plan of it?—Witness presented a map on which he explained the scheme to the Commission.
- 20. Q. What will be the cost?—Thirty-seven lakhs for 60 miles. You cannot extend it beyond the Tilawi on account of the only possible nligament having to pass through Nopal.
- 21. Q. Could not some sottlement be arrived at with the Nopalese P.—I expect the Nepelese would claim irrigation for all this here (indicates on map). We would not gain much by it.
- 22. Q. What do you fix the minimum discharge of the Tribeni at?—Sufficient to irrigate 200 acres to the square mile with a duty of 50 neres to the value
- 23. Q. How is the work getting on?—We only storted it last year. It is in un out-of-the-woy part of the world and has a had reputation for fever, and we had great difficulty in getting contractors to go up there. We have made a good start now and I hope wo shall get the first fifteen miles open this year.
- 24. Q. I cannot see why if all that Nepal would ask would be irrigation for the parts you refor to, wo could not give it to them?—I do not know what could be done, but from what one hears about Nopal they would not allow n European in their
- 25. Q. Now please tell us about the other projects?—I would first like to explain what the witnesses and about the pains? The Tribeni Canal crosses 22 streems, of which six are real hill streams which have sandy beds, not more than three or four feet below the lovel of the country. The others are deep nullahs, From all these hill streams they have any number of pains. Now they take nearly every drop of water eat of these streams. The nullahs are much deeper and have fewer pains taking off from them. I think a good deal could be done especially from the two principal streams in regulating these pains. At present there is no order. A man takes as much water as he wants and turns the rest on to his neighbours' lands.

Mr. T. Butler.

1

- 26. Q. Do you propose to feed these pains from the canalt—No. The distribution of water from them should be regulated to irrigate the area between the foot of the hills and the canal. That is a very arid tract. The lond is good and it only wants water to get a good erop. They do get good erops wherever they can get the water. It wants some legislation to settle rights and distribute water to the best advantage. If we take the projects in order, the Tilowi comes first. Mr. Dunsford said this Tilowi is never bunded in Nepal. I don't think he is quite correct there. What he means is that such bunding has never affected his supply. There is always, I believe, a certain supply coming down. I think the scheme sketched out in the report would not be a very expensive one. It would be advisable to at first construct only a sluice on the river bank with a channel leading from it to the area to be irrigated. When the water level on the river fell too low to feed the sinice, an earthon cross bund could he constructed to raise the water level. Afterwards if considered advisable the earthon bund could be replaced by a mosonry woir. No doubt we would interfere with Mr. Duasford's little scheme and probably he would want for a certain area for nothing. nothing.
- 27. Q. As regards the Tilawi, supposing the water failed you, you could supply it from the Tribeni extension?—Yes. Any surplus we had could be passed into it. I think we could always depend for a supply from the Tribeni when this extension was made.
- 28. Q. What would he the supply ?—A certain supply of 30 or 40 cubic feet per second.
- 29. Q. (Sir Thomas Higham.)—You cannot work on the Tilawi without a weir?—The idea was to have a weir across the Tilawi and use the water of the Tilawi and any surplus water from the Tribeni ex-
- 30. Q. Then we come on to the Poussa?—That is a very small scheme, but though the Nepalese do bund the river, they cannot bund it till the woter runs low, and even when they hand it, there is a certain amount of water from percolation.
- 31. Q. What does the river do in a dry year ?—It dries up altogether after the middle of October.
- 32. Q. What amount do they get for the hathia?—You get sufficient to irrigate five or six thousand acres for the hathia.
- 33. Q. Next comes the Bakiya ?—The Bakiya is practically the same as the Pousso. The Madhuhani Canal cuts in hetween the Poussa and the Bakiya. There has just been a new distributary sanctioned from it and we expect to be allo't to charge a waterate from that. In the Bakiya we made a cross bund; they probably would make a little canal themselves if we laid it out for them, but they would prohably prefer somebody with anthority like the Collector to administer it.
- 34. Q. Have these sebemes all gone in to the Government of India?—They have been only sketched out

- for this Commission. They have not been actually levelled except the Tribeni and Dhakka.
- 35. Q. Next comes the Dbakka?—Three-fourths of that has been completed. We expect to get water from it next yeor.
- 36. Q. How many cubic feet por second?—It is estimated at 300, but we cut it down to 170.
- S7. Q. Do you want a weir across the river?-
- 38. Q. Then we come on to a bigger scheme, the Bagmatti?—I am afraid that is a very hopeless case. It was commenced os a fomine work. Under instructions I prepared a report for a schemo without a
- weir.

  39. Q. What is wrong with the schemo; no water in the river?—There is water in the Bogmatti, but the difficulty would be to get it into the canal without a weir. You are never sure that the dean without a weir. You are never sure that the dean stream will remain on your side of the river, because the river wanders from side to side. What Mr. Disacy proposed was to moke a canol only for robi irrigation so as to avoid any expense of museary works; that is, to moke a series of long channels, so that the flood water of the river would be allowed to go between them, and he proposes in the cold weather to bund those gaps and put a cross bund on the river helow and thus let the water come down into the Lakandi. If you can do that it might pay, but I am afraid there would hardly be time enough to get the water for the sowing of the rabi erop. It would cutail considerable expense and the people would not care to do it unless they really wanted that weter. Then again, when you get it into the Lakandi, you have no means of distributing it. There is one other point I would like to mention; it is in regard to making channels from the sluices in emhankments. I think that is one of the cheapest and most economical ways of saving portion of the rice crop in a dry season. Mr. Disney has, I think, mode a note on it. It appeals to the men here; they understand it more than anything else. anythiag elso.
- 40. Q. (Sir Thomas Highom.)—Have you sandbag bunds at all hero?—Not usually.
- 41. Q. (The President.)—What about the Dous schemo?—That is in Durbhanga. I know nothing about it personolly. I have never seen the country that could be irrigated from the Dousa.
- 42. Q. (The President).—Then what do you say as regards the Kamala?—On the Kamala I have seen part of the country. It is essentially a rice country. The levels are known; a canol is feasible and the supply is sure, and it would be a really sound scheme. I think the only question about the Kamla scheme is whether the people are willing to pay a water-rate.
- 43. Q. Is that a country with European planters? There are few so far north. The land nearly all belongs to the Durbhauga Raj.

#### FIFTH DAY.

#### Durbhanga, 30th October 1902.

WITNESS No. 39 .- MR. A. H. O. MACCARTHY, Executive Engineer, Gandak Division.

Mr. A. H. C. 1. Q. (The President.)—How many years have you MacCarthy. heen here?—Eight months.

2. Q. Have you any previous knowledge of the dis-30 Oct. 02. triet?—No.

- S. Q. Do you know the Saran canals?—Yes; the regulation of the head sluices is under my charge.
- 4. Q. Do you know the wishes of the people in regard to those canals?—Yes.
- gard to those canals?—Yes.

  5. Q. What is your opinion about them?—Personally I do not thank that any satisfactory project is possible except to make a high level canal and have the central of the water in the hands of the Public Works Deportment. The channels must be properly graded with weirs across them. Then it might work.
- 6. Q. But you cannot say definitely?—No. Thero is no impossibility in the scheme. It is all a question of cost. The canals would get a good supply up to the middle of October, and then they would saddenly

- Q. Are the sluices high and dry for a considerable part of the year?—I cannot say.
- 8. Q. Woald it be any good to lower the sills?—
  I do not know. I have been told it would be uscless.
  I think there is some water in the sota all the year ronad, but I have not seen it myself in the cold
- 9. Q. As to the Dhous schemes: what is your opinion as to the Dbous scheme?—There is no assured supply of water, because it is hunded in Nepal. Last year there were two bunds in Nopal. This year from September 20th to Octoher 20th the discharge was 2,000—350 cuses, but this year is an exceptional year; no one wants water. There are no gauges now; they have been all swept away. I was told to toke discharge observations only. toko disehargo observatioas oaly.
- 10. Q. That seems a fatal objection to this Dhous scheme?—I heard in the May before last that it has never been bunded except in the cold weather and thot thero was always a good supply of water. Last year it was bunded and there was no discharge at all.

- 11. Q. Have you had eccasion to look into this schome at all apart from the water-supply?—Yes, I was the one who drow up the scheme for it. The area commanded by the Dhous is 70 square miles.
- 12. Q. Is the Kamla a much more premising scheme, I believe?—There is a scheme drawn up, with plans and estimates prepared. The original scheme was to cost more than 201 laklis.
- 13. Q. And the river has warped for six miles?—Yes, the Balan has shifted over the country. But the second half of the schome, the western portion, I calculate to cost Rs. 10,41,000. There was not sufficient water to carry out the further scheme.
- 14. Q. It was not to obtain water from the Balan?-No; it was morely to be extended to the Balan.
- 15. Q. Have you got the discharges of the Kamla?
  —On the 6th of October it was 4,067 ensecs, on the
  13th it was 3,308 and on the 20th 2,015. It was an exceptional year.
- 16. Q. Is the scheme, as it now stands, a modified one?—I cut out the eastern portion. In other respects the scheme is exactly as it was.
- 17. Q. If the order were given, cau you communed the execution of the work at once?—No; it requires a good deal of revision; I only did it roughly. It is not in working order yet.
- 18. Q. Is the river pretty constant at the site proposed?—Judging from the old maps that we have got of 20 or 30 years ago it has not changed a bit on the frontier. But it has changed a great deal further down. The bed at Jynngar is very constant.
- 19. Q. Has there been any record of the discharge?
- 20 Q. Is the river dry towards the end of the cold weather?—It is constant in the cold weather. In May

there was two feet of water in the river, but I could Mr. A.H. C. see no flow.

21. Q. (Sir Thomas Higham.)—Are there any gauges kept on the Saran canals?—Yes; at head slui
39 Oct. 02.

- 22. Q. How many years back do they run?—For 20 years, I suppose; since the canal was started. But they have not beca read when the canal has been 'closed. There is a hiatus.
- 'closed. There is a hiatus.

  23. Q. Do you know the discharge?—The maximum discharge was 150 cusees from the head gate. My experience is that if you give water to one slune you cannot always give it to the other, that is, in the hot weather, before the rains. The bunds were put in November last year; they went when the rains burst. During the last year we did not require any water; it was only later in the year when the river had gone down. We cut the entrance bund to let water down and it was that time we got 150 cusees.

  24. O Are those cannis onen just now?—Yes: but
- 24. Q. Are those cannls open just now?—Yes; but the river has fallen so low now that there is practically no water in the sola, and unless we put oross bands there will be no supply. One band costs Rs. 700; the others only Rs. 150. The Gandaki will be difficult, because you will have to put a by-wash in it.
- 25. Q. What is the total supply in the sota?—Not more than 250 cusees, I think.
- 26. Q. Is there any fear that the sota will change its course?—There is very great fear.
- 27. Q. Yey have a good many sluices in the embankment which have nover been opened?—A good many.
- 28. Q. What were they made for ?—I presume for irrigation. They are never used now. I suppose they were built before the canal was built. They are all the way down to Sonepore.

## WITHESS No. 39.-Mu. S. L. MADDOX, Collector of Durbhanga.

- 1. Q. (The President.)—How long have you been in this pince?—A your this time, and ton yours ugo I acted for three months. I was some time Sub-divisional Officer to the south of this district.
- 2. Q. (Mr. Muir-Mackensie)—Wore you here in the famine?—No.
- 3. Q. (The President.)—We are much obliged to you for the carefully prepared paper you have submitted. You say in "Bearpatti Thana the comparatively large area under irrigation is on account of the connections between the Kamla channels mude by Mr. R. S. King, Raj Sub-Manager. Some of these channels are also situated in Madhubani Thana." I notice in the statement in the front page that in the Benipatti Division there are 42,655 acres entered as the average irrigated area. Is thus area due to the notion of the Kamla channels made by Mr. King?—Not ontirely. There are small tanks and other small nullahs from which irrigation is nunde. This is the total from the settlement record for that thana.
- 4. Q. In rouly to question 4 you say "the cultiva-tion is not dependent on artifical irrigation here": in ordinary years, I presume?—The ordinary minfall is sufficient.
- 5. Q. You give a list of the sensons of famine and severe scarcity. It is a little difficult to draw the line between famine and severe scarcity. Have you any particular rule in your mind?—I call 1892 severe scarcity and amounting to famine Last year was scarcity, but not severe scarcity. 1895-96 would be severe scarcity, not amounting to famine. I was guided by the figures for relief more than anything clse and also by the Government of Bongal's letter. I have taken the terms used therein.
- 6. Q. The number relieved is not n very good eriterion, because the policy of the Government is not the same overy year?—That is so, especially in 1878-74.
- 7. Q. In 1896-97 the rice crop was only 31 per cont.?—Yos.
- 8. Q. In 1901-02 "the failure, having followed three years of good crops, did not cause famine." That is, prices did not go up very high?—And there was a very good rice crop in Nepal.
- 9. Q. In 1873 you say "Mr. Carlyle (on incorrecareas) calculates the yield of the crops," etc. ?—H had not the settlement records; that is all I mennt. ctc. ?-Ho
- 10. Q. I see he puts down a normal yield as 284 lakhs of maunds, and you work it out as 293 lakhs.

- The difference is not much?—No, but he had not the area as correct as we have, because the survey came in between.
- 11. Q. Do cultivators in this district attach the same importance to a supply of water during the halhia, the early part of October, as we have found to be the ease elsewhere?—They do.
- 12. Q. I suppose these figures are correct at the bottom of page 5; that there have been 76 laklis of rupees spent in 29 years?—My authority is the Government of Bengal's letter.
- 13. Q. Supposing satisfactory irrigation schomes were carried out in Northern Durbhauga, in how many years out of ten would the people take water?—At first they would not take water until they were driven to it; at first once in every five years, and after they have appreciated the bonifits of it they would take water oftener.
- 14. Q. If the Nopaleso allow water to come down only when nobody wants it, it is not worth while spending money on the Dhous scheme?—No.
- spending meney on the Phous scheme?—No.

  15. Q. On page 6 you say "it is stated in Mr. Macoacchy's note that originally the 'Kamla scheme, provided for an extension of the channel castwird to the Balan, but that new that the Balan has slufted its main channel?' miles eastward, the larger scheme could not be undortaken." Mr. Macoachy gives us another reason that thore is no water?—Yes, but I am not satisfied that Mr. Macoachy was correctly infromed that the Balan has actually slufted.

  16. O You say in the next paragraph that there is
- 16. Q. You say in the next paragraph that there is "a scheme for connecting the channels of the Bihul and Punchi and running distributaries southward over the northern portions of Allapore." You hope to produce the plans?—Yes. Kharag, not Panchi, is the correct name of the second river.
- 17. Q. It is a project that the engineers have not taken up nt all?—No; it was done when the Durbhangn Raj was in the Court of Wards, and I de not think it has been scrutinised by the Government engi-
- 18. Q. Have you reason to believe that it deserves scruting?—I have. I have rough plans here. [Explanation of plans.]
- 19. Q. The essential points seem to be: how much water we cau count upon in a year of scarcity. Nepal keeps the water-cock in her hands. Is that part of a district where there is severe want?—Yes; but not quite so severe as in the north-west parts. There is another channel too, since then, to cost Rs. 2,000

Mr. S. L. Maddox.

30 Oct. 02.

Ben.

Maddox.

Mr. S. L. just north of the end of the Kamla channel, if carried Maddox: eestward to the Bolan, 25 miles.

- eestward to the Bolan, 25 miles.

  20. Q. Is that the kied of thing the Maharaja wends undertoke?—I think so, to give fomine relief.

  21. Q. You say that well irrigotion is not practised in this district?—That is so. In the south-west, bordering on Hajipar, they use wells for garden produce and in the north-west for opium and special crops they use o few wells, but the soil is not fit for wells in this district.
  - 22. Q. Another reoson might be that the whole of the country is under rice?—Yes; kochcha wells could not stand the floods. A pokka well would not be sufficient for the irrigation of rice.
  - 23. Q. In order to prepare the district for the possible edvent of another fomine, you strongly advocate the carrying out of these irrigotion schemes in the north, assuming that they are technically possible?—
  - 24. Q. And do you think that they would meet the situation? If the Collector had not got on his shoulders o very budgry population in the northern part of the district, you would pull through fomine ell right?—Yes, if a large section of the area were protected, we should pull through without relief works.
  - 25. Q. Do you keep a programme for relief works?

    -Yes.
  - 26. Q. Is that arranged under your direction by the District Engineer?—Yes; when I come in November I found a progremme ond medified it to suit the places where the crops had failed. It is priocipally of roads and tanks.
  - 27. Q. Tanks merely for drinking water for eattle, etc.?—Yes.
    - 28. Q. Excovated?-Yes.
  - 29. Q. Is there much room for the making of roads?
    —There is room for the improving of roads, but we do not want any more new roeds.
  - 30. Q. It is difficult to find work for famino relief. Then, supposing this Komla scheme passes scrutiny from the engineering point of view, would you keep it in reserve for future famines for relief, or would you earry it out at once for protection?—At once, to see how far it terres.
  - 31. Q. (Mr. Muir-Mackenzie.)—There is a considerable area under bhodoi rico?—Aus paddy wo call it.
  - 32. Q. Could the other kind of rice, aghani, be substituted if irrigation were introduced? It grows ot a different time, it is an early paddy?—I cannot
  - 33 Q. These tanks and roads apparently are not likely to be of much uso to you; could you substitute in your programme any works likely to be useful for irrigation?—Yes, I have got in my emended programme some local works, channels ond things which I here found out—things locally useful, for a small number of people. I here four or five for coch thans.
  - 34. Q. Would it not be possible to devise a programme of such works as would employ a large number of people, supposing you had a special officer going about the country investigating this metter?—Certainly.

  - 35. Q. What would be the nature of the work?—Poras entirely. A greet mony might be mode.

    36. Q. And nothing in the nature of irrigation tanks, or ahors?—I have no experience of them, but I fancy the floods would moke reservoir-making diffi-
  - cult.

    37. Q. When the famine was over you try to onconrage the digging of kochcha wells anywhere?—I was not here during the fomine. In my answer on page 2 to question 11 I say "the Commissioner in his No. 609-G. of 1896" (which must have been in the time of fomine) "ogrees with the Collector that rewards for making kachcha wells in this district are not odvisable owing to the nature of the soil."
  - 38. Q. But do you think that is the case?—It would he in the north of the district. They would be useful in the south, but the two southern thancs are not in our famine aree.
  - 39. Q. Would you expect the floods to speil your wells if you made them at the commencement of the famine? But would you got the water then?—No, I think not
  - 40. Q. With regard to the extension of well irrigotion, there appears to be some port of the district where the Opum Department find it worth while to moke wells. Do you not think n little more might be done by the Revenue Deportment on the some lines?—Yes, except in rice lends.

- 41. Q. In these parts is there any substantial proportion of lend which is not rice lend?—In the Kajauli Tbana where there is a substantial area of rabi inods.
- 42. Q. What is the immunity of the two soethers thanas due to?—To the difference of the soil and the voriety of the erops. They are not dependent on rice.
  - 43. Q. Not due to their irrigation ?-No.
- 44. Q. Were odvances given in the fomine to encourage the construction of pains onywhere?—I heliovo
- 45. Q. Do you onticipate that such odvances might usefully be made?—If one could know e little beforehend, but if there was no water, they would not be so ready to come forward to take advences for pains.
- ready to come ferward to take advances for pains.

  46. Q. Thorefore in famino time advances would be of no use. If advances were made in good years, would the people make pains?—In certain areas, yes. It would depend on the influence of the zamiodars?—Thet assuces that the odvances would be given geoerbily to the tenonts. Do not you think the zamiodars should be induced to make the pains?—The Mohorajo is a lorge zaminder and he would make poins.

  47. O. In answer to question 8 claves I was given.
- 47. Q. In answer to question 8, clouse I, you give the perceotoge of outturn. I believe 100 is supposed to be a rich crop?—A normal crop.
- 48. Q. Then in 10 years you have only got two crops of bhadei, two of agheni and one of rabi. Does not that indicate a tendency on the port of the people to under-estimate their crops? They never will acknowledge the normal crop?—Yes.
- 49. Q. Perhaps 75 or 80 might be a normal crop?
  -Yes.
- 50. Q. Moy we take it as probable that in this district you will not have enything like a famine unless you have two bed years ruoning?—The figures show that, because lest year we had a less total, 57 inches os against 58 in the famine year, and there was no femine lest year.
- 51. Q. Does the district feed itself in normal times? I should say so.
- 52. Q. Do you over think of laving any smoller irrigation works in the district that might be managed by the District Board?—I should like to heve such
- 53. Q. Would you like to see the District Board empowered controry to the present low?—Yes.
  54. Q. Would you prefer that the Board should manage it or the Collector?—The Collector is Cheirman of the District Board.
- 55. Q. Should he have the Board to act with or by himsolf?—There are some officers who entertain a very strong opinion that the Collector could do more if he were made independent of the Beerd. In Saran, however, the Board is particularly strong. There, some think, that the Board might help very much.
- 56. Q. A hundred thousand ocres ore olready irrigated by pains or other sources-private irrigation works other then wells?—Perbaps Mr. King's chonnels might holp very much.

1

- 57. Q. Have you n srteng Board here ?—Yes; meny of these geatlemen present are members of our Board —Mr. Lloyd, Mr. King nod others.
- 58. Q. What class of work would you put under the Boord?—I bad intended to put the following works under the Board. [Quototion from supplementery statement.] In the course of my enquiries in eamp I preposed the following local works of ntility; but on good rain fell in March just when the conditions in the north-cost frontier (Phulparas) were becoming critical, so no estimates were prepored:—
- "], Durbhanga Thona. (1) Channel from the river Sikāru to the river Būrnad; thence into the nerthern villages of Jalley outpost.
  - (2) Chondehor tank in Paktola to be excevated ood chonnel to be dug out on the south-
  - (3) In Jogiana Bobaji's tank to be dag out and rood raised for four miles from the Chemortela to the Madhubeni roed; olse a tenk in the south of Jogiora.
  - (4) In Ratanpur three tonks to be dug out.
- "2. Bahera Thono. (1) A channel to be cut from the Komla river to Madhopar (north-west of Bahera).
  - (2) A tonk to be oxcavated on the west side of Pohardi villoge.

from the Balan river at Parsahi to Kalpati through Maharajpur, Siswar, Dhanjera and Kallapatti. Levels have been taken and estimates for Rs. 10,000 have been drawn out. The Maharaja will probably undertake this work.

(3) Further north near the frontier, a channel to connect the Bihul and Pancha hill

"4. Khajauli Thana. (1) A channel to be cut from the Kamle river at Marhia Chât and to be brought southward through the affected villages.

, à

ď

. ?

q

į

;

ati Thana. (1) Mr. Christian's channel bringing water senthward. . . "5, Benipati Thana.

(3) A channel to be deepened and dug cut from the Jamoi river to Kowaha."

50. Q. If you utilise the period of good years to have a thorough investigation of the country, yen would get well considered schemes in a considerable number of ploces?—Yes.

60. Q. You have considerable experience as a Settlement Officer?—Yes. I was in Orissa sevon years on settlement work.

61. Q. You have never framed anything like records in water?—No.

62. Q. De you think it might be useful in places where there is a considerable amount of complication in the rights to the water; for instance, on rivers where disputes arise as to the right to erect bunds and pains, where disputes are likely to arise os to time in which the water is to be used? Would not it be voluable to cuter these things?-Yes, most valuable.

C3. Q. And would you advocate the Collector having of the facts recorded in the record-of-rights? At present they have to go to the Civil Courts?—Yes, and with a large extent of bitterness.

64. Q. (Mr. Rajaratua Mudaliar.)—Are there many pains in this zamiudari?—Net many.

65. Q. A hundred thousand acres are already irrigated by pains or other sources—private irrigation works other than wells?—Perhaps Mr. King's channels might account for 80 per ceut. of that.

66. Q. Is there scope for the construction of mero pains?—Yes.

67. Q. Is the Durbhanga State prepared to carry them out?—I think the Maharaja would de so if he were assured that pains were for the benefit of the

63. Q. I suppose they have not been investigated?—Mr. King is doing a good deal in the north of the district, and I believe he has plans for the eastern Kamla sluices.

69. Q. (Mr. Muir-Machenzie.)—II are yen had much experience in takavi advances?—No.

70. Q. During this last year have you granted many?
—A few; about Rs. 1,600.

71. Q. That is a very small sum for a large district?
-Yes.

72. Q. What are the reasons; why you are unable to get rid of any mero?—The rayats apply so very late. If they would apply earlier, we could give them advances. They apply when the season has gone.

73. Q. Thore were a good many applications that were not complied with —No; generally the applications are complied with when they are put in. They go on in their distress until advances for seeds, etc., are useless and then apply; that is, very few apply.

74. Q. How long would it take you to go through the enquiry before you grant the application?—A long

75. Q. Do not you think that that time ought to be shortened?—Yes.

76. Q. What method would you propose?—Let one Deputy Collector devote his time to the purpose.

77. Q. Would you put a man on that and nething else?—We could not spare him.

78. Q. If you were given additional mon?—Yes. 79. Q. Would there be enough work for him to do? Not always; only perhaps at certain times.

80. Q. Would that only arise in n big famine—No; in severe scarcity and scarcity.

81. O. In scarcity would you like to apply to your Local Government to give you a special man?—Yes.

82. Q. Would you send him out with mency in his pecket?—I should like to de that:

83. Q. With machinery of that sort how long do you think it would take to dispose of the applications?—
We could dispose of thom within a week. I see no reason why we could not do this. It would depend on the number put in a week.

84. Q. How many Sub-divisional Officers have you? I liave two-one at Samastipur and one at Madhu-

85. Q. Are they empowered to grant taken leans?—They are empowered to make enquiries. They don't actually grant the leans; they recommend to me.

86. Q. Are they empowered to receive applications—I think so. I am not certain. Mr. Watson is here and he would be able to tell you.

87. Q. De you think it would be a good thing, if, as a matter of course, all Sub-divisional Officers were empowered?—Certainly.

88. Q. Do you apply every year for a certain alletmont for advances?—Yes. In fact last January I applied for an extra alletmont, but I could not spend it before March. I have plenty for this year.

89. Q. Hew much?—I cannot tell you. I will find out and let you knew to-morrow.

90. Q. It is nothing like a lakh of rupees ?-Ne.

91. Q. Rs. 10,000?-I think we have Rs. 5,000 fer this year.

92. Q. (Mr. Allen.)—We only get four lakhs for the whole province.

93. Q (Mr. Rajaratna Mudaliar.)—I suppose zamindars would be disposed to grant leans?—Yes. Zamindars de grant leans; the Moharaja grants leans.

91. Q. What rate of interest is charged?—I don't knew; I have no idea at all.

95. Q. (Mr. Muir-Mackenzie.)—Are the leans under the Lands Improvements Act or the Agricultural Leans Act ?—Our applications generally are under the Agricul-tural Leans Act and not under the Lands Improvements

96. Q. (Mr. Rajaratna Mudaliar.)—The Agricultural loans is chiefly for opium?—That is different. They give such advances independently of the Collec-

97. Q. (Mr. Allen.)—What were the fleeds due to this year,—all the streams?—The first fleed which broke in the frentier on the 12th came down in the Janani, Kamla and the Balan, and it was due, it is said, to 20 inches of rain in Nepal—not to any local rainfall.

98. Q. After that was the flooding of the streams general, or coulined to any particular streams?—General in the first flood.

99. Q. Durbhanga is the biggest rice-growing district in Bihar?—I have not seen the figures.

100. Q. There is a very large quantity of rice imperted from Durbhanga?—Yes.

101. Q. Especially from Saran?-That I den't knew.

192. Q. In connection with this question about Dis-192. Q. In connection with this question about District Boards taking up irrigation, if the law were amended, would the District Board have any funds to meet the deficit from irrigation schemes? Would you have enough money for roads and have a surplus in the District Fund?—This year we have, because we put away Rs. 71,000 to be spent on famine and there was no tamine.

103. Q. In ordinary years would you, as a rule, have a surplus?—We have. My opinion is that the District Engineers de not spend all the money alletted to them every year, and that in fact there are savings every year. I think I could prove that from the figures. the figures.

104. Q.—It is the general experience that District Boards have not sufficient funds to carry on their own ordinary work?—This (Durbhanga) is a very much richer District Board than most.

105. Q. (The President.)—Where do the District Beard get their funds?—From road cess.

106. Q. (Mr. Allen).—Has any scheme been put ferward in this district by the District Engineer for feeding tanks by pains from rivers?—Yes.

107. Q. Can yen give us seme opinion about that?— Here is a report which Mr. Barton sent to me, and Mr. Barton is on leave. I only found it yesterday.

103. Q. It was a scheme, I understand, for feedig tanks by pains?—For feeding tanks some existing and others had to be made from the snow-fed rivers.

109. Q. If such a scheme were practicable, de you think it would be useful for irrigation purposes?—
I think it would be very useful, but I don't think it

Mr. S. L. Maddox.

30 Oct. 02.

would be practicable, because there would be such difficulty in maintaining these channels, when they were made, even if you declared them to be under the Embankment Act, and there would be a series of vexntious cases. The rayats would not preserve them.

- 110. Q. (Mr. Mnir-Mackenzie.)—You would have te have some power in the hands of the Collector to obligo these channels to be kept in a state of repair?—Xes, you should have to nequire the lands for the channels first.
- 111. Q. Is there ne hope of the people giving the lands for these channels which would be useful for irrigation?—I think Mr. King could do it, or one of the Maharaja's managers could do it, but I den't think the ordinary zamindars have any give or toke to help each other.
- 112. Q. (Mr. ARen.)—Mr. Mackenzio asked you a question about the record of rights of streams. Do you agree there is nothing in the present Bengal Tenancy Act to prevent your making such a record-of-rights?—The law permits it. I know nothing against it.
- agninst it.

  113. Q. (The President.)—You have got here a very large zamindari and a number of small proprietors in different places. Are there may particulars on which you cannot get information as regards a large zamindari which you do get about small ones? This recoson I ask you this is because there are very large important zamindaris in Madras, and for the purposes of our ougnities we found that there was an absolute want of information which apparently was extremely difficult to get. Do you find any difficulty as regards that?—No. Any information I have asked for from the Muharaja has also done so himself.

  114. O. (Mr. Recording Mudalar.)—What is your
- 114. Q. (Mr Razaraina Mudaliar.)—What is your guarantee that the figures are correct?—We have got European managers.
- 115. Q. You have got your settlement records and your revenue records Are they the same? Are they as full of details for small as for large zamindaris?—Xes.
- 116. Q. (Mr. Muir-Mackenzic.)—Until you compiled your actilement records you were without a great doub

- of information which you now have?—Yos, I could not have given you these figures.

  117. Q. (Mr. Rajaratna Mudaliar.)—Under the bhaoli system what occounts do you keep?—I think Mr. Lloyd would be able to give you the information. He could show you the bhaoli accounts.
- 118. Q. (Sir Thomas Higham.)—There is no extensive programme of tank excavation here; is there not?

  —Yes.
- 119. Q. You have made very large tanks, I think all over the district?—Yes.
- 120. Q. Have they been of any bonoft? I den't think I can say. Some drigotion are done from thom last year. I don't think they were made originally for the nurpose of irrigation. Mr. King would be able to toll you in regard to the tanks made last year in the famine.
- 121. Q. Are they filled with water?—They have filled this year probably. They went very low last
- 122. Q. You cannot say whether these tunks have been any particular good?—I find that the sites wore not acquired, so that the tanks in many cases have gone back to the zamindars. Now these tonks Government excavated are becoming the property of the zantindars.
- 123. Q. Do the ramindars nade uny use of them?—I suppose the rayats use them for irrigation, watering their cattle and drinking purposes.
- 121. Q. You cannot say whether they do or not?\_\_\_ I should say they do.
- 125. Q. I suppose there is plenty of water for cattle nt any timof—Except in a case like last year, when the rains ceased early; last year the water-supply was very short indeed.
- 126. Q. It is said that these tanks would be very valuable for the fish they have in them. Do they have any fish in them?—I don't know, Sir. Mr. Onraet could tell us, I think.
- [Addressing Mr. Rajnrutnn Mudaliar, witness said :
   You asked me low much was irrigated from tanks
  here; 45,000 aeres are returned as irrigated from
  tanks.]

WITNESS No. 40 -Ma R. S, King, Manager, Durbhanga Raj.

Note on Irrigation, Rokika Circle.

Mr. R. S. King.

- 1. In famine of 1897, hesides Rs. 50,0% spent in ro-1. In faming of 1817, besides is, 60,000 perts in resecretaring tanks in this circle, Rs. 10,000 were expended
  in some 5-mile channels and temparary dams to lead
  water from the present Kainla bed into the ald bods being
  east (which act as distributories having pains leading from
  them to the adjacent rice land). In this way some
  25,000 bighas of rice crops were saved and rabi crops irrigated then
- 2. The above channels and 13 miles more made in May 1901, noted an every fre-het during the scanty rains of 1901 (the Kamla comes direct from Nepal valley and hence freshets frequently poss down without any local min here owing to roin having fallen there or in the lawer hills. In this way the full rive and rabi crops of sone 40,000 bighas were secured in 42 villages.
- 3. After the cessation of the rains about the first week in November 1901, as soon as the water passing down the Kamla had become fairly regular in volume a temporary mbankment and weir was started at Narkattia, Il miles north of Madhubani, and 41 miles of channels, 15 feet wide, deepen of 13 feet to lead water east to the Jitatch river, along which the rice crops had oftenly failed the rains never having been sufficient to make this stream flow. Owing to freshets in the Kanala this embankment at Narkattia was three times washed away during construction and the water could not be turned down the main channel till 12th December 1001, when it first began to flow steadily. This embank-ment was maintained up to 81b Mny 1902, when the first heavy freshet swept it nway.
- 4. After filling the Jibatch river-bed from Rarhmalmal to Malaugia (about 12 miles) and flooding from it the

- fields alongside by various temporary dams along its cour o cuttings were unde eastward from it at Keenia, 6 miles north at Madhebani, leading the water into old leds, and the water begen to flow along these on 6th February 1903, thus giving water to many villages which were in a very distressed state for want of it for cattle. Madhulani town of 18,000 inhabilitate was also given a fresh supply of water when distressed for want of it and chelera rife. Rs. 4,000 were spent on this work. were spent on this work.
- 5. The whole flow of water in the Kamla was directed down these channels.

C.

- I have never seen the Kamla se low before during my 13 years' experience of it. At one time (m A ril) the total flaw was only sufficient to fill u channel, 20' wide and 20' deep, with a fall of 2 feet rer mile, and there was practically no waste through the weir. (Puring the famine of 1897 we could never close the waste weit completely, as the flow was at lowest senson always double the amount required to fill a channel, 20 feet wide and 21 feet deep, with a fall of 3 feet per mile.)
- A tabular statement is onnexed showing the areas

	Bighas.
Full crops scented for 1309 F	40,000
Robi crop irrigated and tanks filled . Tunks filled, eattle sopplied and seed-	5,000
lings secured for 1310 F.	15,000
	60,000

- 1. Q. (The President.)—You are one of the managers of this Raj. I am sub-manager of this Raj.
- 2. Q. How long bare you been in it ?-Thirteen years.
- 3. Q. You have n very intimate acquaintance with the reople here and have seen them through these years of famine !- Yes.
- 4. Q. You have managed to frame some relief works
- 5. Q. We have read with great interest what you have not on the Kamla. Have you n map here?—There is a dnos ou the Kamla. map here which I think would give it at a glance. This is it (hands it in). It is on un inch to the mile scale, and as

regards the different Sections A, B and C, A is the portion in which the crops have been scenred during the last season, B represents the portion in which the rabi crop was irrigated and C are the villages which the water reached in gaven and U are the valleys which the maker reached in February, March and April for Illing the tanks, watering the enth and giving water to seedlines for the current year. (Explained on map.) This bund (indicates Narkattia) was begun in Navember and was finished on the 12th of December. It burst three times before it was finally finished. The bund cost about its. 1,000 for making and mainta uing for six months. There were continual ire-lets coming down the river and I ran the water into the old b-ds of the Kamla and irrigated all these crops (shown on map). It was not raised high enough to take it down this channel (Indicates) until we made an embankment.

- 6. Q. Is this (points to it) all rice land ?-Roughly ? of it is.
- 7. Q. Did they get their hathia water?--No; with irriganien water this crop was pulled through; on an average they got 12 or 14 aniso of it.
- 8. Q. You can claim all this yellow (en map) as crops secured and all this green (on map) as comps aved by your bunds or channels?—Yes. It was not in time for the rowbunds or channels?—Yes. It was not in time for the rowing of the rabi. The rabi which was sown was secured, but it was not a full rabi crop. The rabi was sown in Ootober and the water began to come down here in Decemher. The water was running down this Areth channel. The bhudoi and rice and rubi were all secored.
- 9. Q. Suppose none of these channels were made, would all these crops have been lost?—No. I don't think so. In parts you would have not half; on the west you would have had a fonr-anna or six anna crop, I think. There would have been scaroity, but I don't think there would have been famine exactly.
- 10 Q. How many bighas or seres do you consider that on irrigated by these means full is shown in brief hero (man) d1,000 across of yellow; that is the crop sconred, 5,000 of rabi irrigated after it had been sown and 15,000 bighas of these villages (shows on man) which had water given to them in their tanks for their oattle and for their soedlings.
- 11. Q. Then 45,000 bighas were really irrigated !- Yes. (At this stage Mr. Maddox put in some stations showing that the outturn of crops on Mr. Klag's channels was 85 per cent, of the normal, while that on the west of this irrigated area averaged 31 per cent, on the east 22 per cent, and on the south 19 per cent.)
  - 12, Q. Se this irrigation quite doubled the value of the onttnrur-More than that. It would be multiplied by four.
  - 13. Q. And the cutlay altogether was how much?—Including the channel made in 1897 it was between Rs. 13,000 and Rs. 14,000.
  - 14. Q. Did you first make these channels in 1897 ?made this channel (indicates on map Narkattia) in 1897 and also this one here (indicates on map Arcrh). I spent Rs. 10,000 in 1897 and Rs. 4,000 last year.
  - 15. Q. It was a very successful onterprise, I think ?—It was only dono bit by bit from practical experience of how the water had been flowing for years with the help of the
  - 16. Q. Now how often did the people want it botween 1887—1:00? Did you use them at all in 1898 and in 1901:—No. They did not require it thou, though, as a matter of fact, this Narkattia channel remained open, because the maliks would not allow it to be closed at the top, but it did irrigate with benefit and gave faller crops.
  - 17. Q. Why would you have closed it ?—I would have closed it because I did not think there was any necessity for it, and it would have prorected it from silting. I thought it was needless to keep it open. I did make a bund, but the maliks would not allow it to he closed.
  - 18. Q. Then the bund was not within the Maharaja'a dominiou?—No. It belongs to a petty malik.
  - 19. Q. Now what would you like to do to ensure and improve this irrigation which you have started there? Would you like to put a hig weir across the Kawla at that place?—I should be afraid of the Kawla leaving the weir.
  - 20. Q. Where is the place where the Kamla Canal is expected to come out?—Near Januagar further up here (indicates on the map). About a mile from the frontier I think. I am not quito certain.
  - 21. Q. In fact the Kamlo irrigation would not be in your tract at all? It would be away to the east?—Yes.

- 22. Q. If that canal were made, your area would be cut Mr. R. S. off from irrigation. In a year of drought your supply would be completely cut off ?—Yes. It would be merely transferring irrigation from one place to another year in April the water was not sofficient in the Kamla river to fill my channels fully.
- 23. Q. In April do you want water for your robi?—If the water was given in October, it would not be wanted in April. In fact the rabi in this part of the country does not require any water if there is a full rainfall at the end of the year in October.
- 24 Q. If the Kamla scheme is carried ont, it means crippling your work? —I thunk, if this Kauda scheme were carried ant, the orays protected by it would be seen red lung before the river would dry up. There would be ample water for everything in October. They would not require water for everything in October. They would not require water in February and March at all if the crops were secured in October, and there is always ample water then.
- 25. Q. The Kamla project is for 600 , ubic feet a second? -1 don't remember.
- 26. Q. That would not be enough for all the lands to be irrigated?—The waste water in October would do for me. I do not apprehend that the Kaula scheme will take away my water. The crops coold be secured by good water before October.
- 27 Q. What about a dry year?—There are freshets coming down when there is no local rain, and I believe there would be ample water for giving all this here (map) a good erms of rice and the waste water would be sufficient for these channels
- 28. Q. (Sir Thomas Higham.)—You would be able to make your bund so much earlier?—Yes
- 29. Q. (The President.) I am chiefly thinking af a year of drought?—The river generally rises sufficiently in the previous rains to give ample water for secoring these crops before the rud of October.
- 30. Q. October is the crucial month; is it not P-Yes. If we get good water in October, it will secure all the rice which has beer planted. In years of the greatest drought such as 1897 and 1902 from \$ to \$ of the rice area has remained unplanted ewing to insufficient rain in August and September. That is plenty and gives moisture for the rabi. They don't want water after the rabi is sown.
- 31. Q. I must say I cannot see how in a year like 1901-1902 yan could irrigate, say, 40,000 bighas, and yet have this Kamla schome in full swing?—The volume of water that comes down the Kamla op till the end of October is sufficient for irrigating the whole district.
- 32. Q. Our evidence is that the supply is only 600 cubic feet a second. We are told that 600 cubic teet a second is all that we can coant upon in October. Forty thousand bighas will use up all that P - At the end of October the minimum would be (01) cubic feet and this work any be done before the 15th of October. I think the ovidance shows that the river falls very anddouly.
- 33. Q. A year of extreme drought is what I am thinking of P—I have got a record of the rainfall here for 25 years, and in all the years the river has been full. Freshets have been coming down constantly every fortnight or so up to middle of October, setting these obannels going fully and giving full irrigation.
- B4 Q. You have done so much at so little cost here that I am doubtful whether it is worth while spending ten lakhs on the Kamla scheme?—My scheme is only for one local nrea. I think a system of pains (i.e., channels) north and south would be very useful.
- 35. Q. You know all about the Dhaus scheme ?-Yes, I have read about it. I have known the Dhaus for 16
- 36. Q. Considering the hold that the Nopal people have on the upper water of that river, is it in your opinion worth spending much money upon it?—I don't think so.
- 37. Q. Would you reject it altogether? I am not qualified to say that. The river has been hunded not only in Nepal, but also on this side of the frontier in British India. It has been bunded off and on for the last 15 or 16 years. I only say that I do not think it is worth spending much money upon, because the water-supply from that river is not much, otherwise they would not have been able to
- 38 Q. (Sir Thomas Higham.)—In making this bund on the Kamla I suppose you employed famine labour?—I had about 500 men working ou it.
  - 39. Q. Whore did you get them from P-Legally.

Last 30 Oct. 02 .

Mr. R. S. King. 30 Oct. 02.

- 40. CD Did all the villages interested in it seed up men to help P—Yes, but the volunteers ware of very little use. They generally arrived whout 12 or 1 o'clock and went awey at 4 and they asked for some food to eat in the middle of the day.
- 41. Q. What did you do ?-I had to do it by contract work, except of course what was done departmentally.
- 42. Q. What was done departmentally?—What they call locally goors, made with hales of grass and olay wrapped together—the only thing that could be used for a bund. In this sandy river all that was done departmentally by dully labour we could not do it by contract work, because we could not get anyone to take it up.
- 43. Q. You did not get anything like a lavy from your villages ?—No; we had no corece. We simply asked for volunteers who did very little hot look on. If I had depended on the volunteers, the bund instead of hursting three times would have burst a dozen times or more.
- 44. Q. For how many years have you made this bund?—The bund was made for the first time in 1897 and it was made again last year, 1901.
- 45. Q. You have not made one every year ?-No; it is not required.
- 46 Q. You have only done it twice?—Yes. Before 1897 the natives said this river could not he bunded, or at any rate they had not socceeded in delog it.
- 47. Q. Which was the easiest, in 1897 or 1901?—Io 1901. I think. I had the experience of 1897 then to belp mo.
- 48. Q. This bund took you four or five weeks ?—Yes. It was about 550 feet or 600 feet long.
- 49. Q. Do yoo know anything about the floods? Do they have very big floods in the Kamle?—Yes. It is impossible to understand what floods these are without coeing them. The whole cooutry is simply ous sheet of water.
- 50. Q. Is there any spill above in Nepal ?-I soppose it does food there equally, but I have not been up to see.
- 51. Q. Any conal that came up here (indicates on the map) would be lishle to be ewept away?—Of course this year it was no abnormally destrictive flood, but I have not got enough professional knowledge to say that.
- 52. Q. You say the whols country is flooded? Yes, to my knowledge it spills from the frontier down to Mohanpur Ghat.
- 53. Q. An far as Nepal is concerned comething might be done here to shut off the spills?—Wo cannot shut off any spill in Nopal whatever wo do here. I om not aware what the depth of the spill in here. Jainagar is a high land, and I think the spill is chiefly to the west of Jainagar.
- 64. Q. What happens when a big flood comes down?— This channel (indicates on the map) I had protected with a very high bank at the mooth with spurs after the drought so that the flood did not pass down it save what flowed to from the sides when the country flooded.
- 55. Q All the schemes that have been put before no are all worked out on the supposition that so a sine qua non water would be given to the rice in the first 15 days of October, what they call the hothic?—Yes.
- 56. Q. What do you call the hathia here?—It varies in the different years. Generally it is the first fortuight in October.
- 67. Q. During that, part of the time you have got freshets and part of the time you have got no water ?—Yee.
- 58. Q. In 1901, if yoo had oo freshets during that partioular fortnight, what would have happened?—It would have been probably an 8-anna crop iostead of 14-aooa crop.
- 59. Q. I suppose it had got water before the hathia?—Ample water.
- 60. Q. If, instead of water being given to the rice orop in the hothio, it is given up to the 15th of November?—I should say it would secure it from drying up and being a failure. It need not be given in the first forteight of October. It may be given up to thefirst week in November. It would then save the crops. I know that from my experience of 1897.
- 61. Q. (The President.)—Do the people here consider it necessary to rou the water off their fields in September?—When they have a normal ruley season they begin rouning off the water io September; they do not do so in dry years.

The state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the s

62. Q. We were told that on the Sone canals they looked upon it as essential to run off the whole of the water in Sep-

- tember, and that then they must have this hathia water at the beginning of October?—I think that it they could depend on getting a supply in the hathia, they would run it off a great deal more than they do
- 63. Q. (Mr. Muir-Mockenzie.)—According to Mr. Maddox, in order to get a real famine to the district, it requires two successive years of failors. Would you say that?—Yes. Well, I should modify that, because we had not two years of failure in 1897; then there was only one year of real failors.
- 64. Q. Mr. Maddox in his paper points out that the rice erop in 1836-97 was worth only 31 per cent. and only 69 per cont. in the year before. The necessity for the large relief measures was occasioned by their having had a short crop a year before?—I should think it was very much accontuated by their having a poor crop: the year before; but we would have required measures of collect probably for } or \$ of the actual area even if there had been a full crop the year previous.
- 65. Q. With regard to these channels that you have made how do you hops to get them maintained?—I had not settled any orrangement for that. I naked the rayats who had get full crops to give me half an anna per bigha for the maintenance of the chancels, and they have done so after a good deal of delay, and I hold come of the moosy in hand now for clearing the silt from the channels. Altogether Rs. 1,800 was paid for the purpose.
- 66. Q. Yoo have us power of calling on them for labour?
- 67. Q. It depended entirely on their being willing to give the money F.—Yes, it was quite optionol. The money was only towards the maintenance of the channels, and I proposed it only as a tentative measure. I had enough trouble in doing it, and I do not feel inclined to do it ognin. There were too moch trouble about it for the return.
- 68. Q. Are they not enough alive to their own interests to help you as regards this ?—Once they have seemed a good crop they do not care a bit, though whils they want water they promise you anything.
- 69. Q. Yoo sald you were able to carry this echsmo of youre through from your intimate knowledge of the country. Do yoo thick yoo might find a good muny other places where the same thing might be done if you had time of examining the country ?—It woold only he after living in the country for some years and going round it that you could do anything. I don't think it would be possible by a simple examination.
- 70. Q. I meen by a professional man?—A person knowing the levels and who had a contour map might do great deal in this way.
- 71. Q. Was there much bhadoi rice in that irrigated area?—No.
  - 72. Q. It was always an aghoni area?-Yes.
- 73. Q. Can you tell me from yoor koowledge of the country whother the increase of means of irrigation is likely to resolt in the substitution of 'aghoni for bhadoi?—I think that the urea of aghuni has increased in this irrigated area eince irrigation has been introduced.
- 74. Q. These works of yours consisted practically, did they not, in the re-opening of silted channels?—My work consisted chiefly ic cutting across the silted areas into the old channels heyond the margin of cilt from the new channel.
- 75. Q. The disneed channels were owing to silting caused by floods P—Yea; my experience of the Kamla is that it throws eilt for about 1½ miles.
- 76. Q. Have you any cases where the obannels become disured owing to the erection of embankment to prevent floods?—No.
- 77. Q. Do you do anything in the way of well irrigation?—In one village only. It is a large opium growing village.
- 78. Q. And the other villages are they unsuited to it?

  —There is un demand for it. The kookeka wells fall in almost at once.
- 79. Q. In this opium village are the welle all kachcha?

  —No, they are pakka. I have given them monoy to make them. It is a village of very high level and does not get water from flooding at all.
- 80. Q. And in there villages, which are of low level, do you think nothing useful could be dood from wells !—I don't think so.

- 81. Q. Not even if wells were made for the growth of the valuable garden crops?—Very little of such garden crops is grown in this area. There is very little tobecco or such crops grown there.
  - S2. Q. On what terms do you give your advances for wells?—We have given the mousy for wells simply as a present to them.
  - 83. Q. You get no return?—They poy their rente regularly and they ore good rayats. It was given as a matter of benevolence from the Maharaja.
  - 84. Q. You got no increased rent?—We got n full rent for the opinm londs, but it is not a specially high rent.
- · 85. Q. It is not enhanced?—In no way on account of wells.
  - 86. Q. (Mr. Rajaratna Muddliar.)—On the louds irrigated by the channels you constructed in 1897, do you not levy any water-rate or any enhanced reat ?—No.
  - 87. Q. These 45,000 bighas are irrigored free, without any charge ?--Yes.
  - 88. Q. You have power to enhance the rent. Could you not have levied on extra charge?—I could have, but we did not ook for it. All we ask for is regular payment of the rents. The Muhamja has been very generous to the raysts in such motters and we have dug tanks and made wells in that way.
  - . Sy. Q. You don't endeavour to recoup yourself, or obtoin of least the interest on the outlay f—No. Within the last year. I have refused in some cases to make embankments, because I found the rayots took no eare of them once they were mode, and relied on us to make good many damages. So now I lend them money to make embankments; when they themselves make the embankments they take greater cure of them, I find.
  - 90. Q. Do you chorgo any interest on these loons ?—At 12 or 12½ per cent., which is two amas on the rupec. The rayats understand it as a simple way of calculating. We lent them money in 1897 at 4 per cent. and found they did not want to repay it, because it was ut such low rates. They paid their makajaus some of this money and then osked for more money, because they could get it cheap, and I have recommended to the Maharaja not to lend money at less than 12½ per cent.
- 91. Q. (The President.)—In that about the bania's rate?—The bania's rote is 25 per cent.
  - 92. Q. (Mr. Rajaratna Mudaliar.)—On the land irricated by your channel in 1897 you would have lost the rent hut for the channels?—We could not have collected it io 1897-98. It would have had to have occu postponed.
  - 98. Q. I suppose you would not have succeeded in getting it all?—Probably we would have lost one-fourth of it.
  - 94. Q. What was the cost of the chonnels?—In 1897 there was un expenditure of Rs. 10,000, including an embonkment. The embonkment cost Rs. 2,000 and the channels Rs. 8,000.
  - . 95. Q. You said that awing to the obstruction of a malik you were anable to extend your channels !—I was unable to close it. It was not the malik in whose lond the channel was on, but on adjoining malik. He would not allow a spur to be unade ut the end of the embankment; hence the water swept round it and ent it uway.
  - 96. Q. In the case of these chunnels did you find any difficulty owing to the want of provision in the low for

- acquiring land in carrying out snob work?—Through personal nequalitance with the locality, the raysts and the adjoining petty maliks, I find no difficulty. They have such confidence in us that they give us the londs. I have generally been able to persuade them.
- 97. Q. Do you think it would be an advantage to amend the low, so that, if there was a refructory tenent, you could compel him to give up the lond?—We have not any question with the tenants, but only with the adjoining matiks. If we have to carry a distributary through some tenant's land, they generally give the land up willingly and we take it off the rent roll.
- 98. Q. (Mr. Muir-Mackenzie.)—Do you think Government would meet with no more difficulty than you do?—I don't think ec. I think the people would have more confidence in Government, and that the Collector could persuade them to give up the land.
- 99. Q. (Mr. Rajaratna Mudaliar.)—You have given some odvances to tenants to make wells. In these cases also do you give them free of any increased rent?—Yes.
- 100. Q. (Mr. Allen.)—You spoke jost now of Government heing able to do this kind of work. Would not the tenonts, os a matter of foet, want Government to pay much more than you pay?—They would undoubtedly do their best to got every pice they could out of Government.
- 101. Q. Do you think ony Government officer would be able to carry out a scheme of this kind in the way you have done it? Is not this u case of your own personal influence?—I think it would require a man of experience and a great deal of opplication and time. You would need to have a special man for that one work ulder.
- 102. Q. Yon have not onything like o water-rote here?—No. It was only levied once last year as a tentative measure, and I found so much difficulty und bother that I have decided not to have anything to do with it again.
  - 103. Q. You don't levy any water-rate ?-No.
- 104. Q. Whot is your opinion about that? Do you think the people would pay, say, Rs. 2 m acro for water in a dry year?—In u dry year they would pay Rs. 2 to not their rice crops in when they sow there was no chance of gotting it in through the mins. At the last pluch they might do it, but they would not do it universally. Possibly 50 or 60 per cent. would do it, but I don't think they would pay unless put to the very last pinch about it.
- 105. Q. What is the rate of rents about that part?—About Rs. 4 per bigha.
- 106. Q. So timt, if lovied, the water-rate would represent about 50 per eact, on the rent?-Yes.
- 107. Q. Would there be any chance of people paying that every year?—No chance at all.
- 108. Q. The enormous benefit you have coused to this country would only be felt in years of drought; you would only require it cook in four or five years?—Yes.
- 109. Q. Is it not a permonent benefit?—It is a permanent benefit in opening up these river-beds, for since the chonnels were made in 1897 these villeges (indicates on map) have had foller crops than the edjoining villages. It means a difference of \(\frac{1}{2}\) to \(\frac{1}{2}\) in the crops.
  - 110. Q. Evon in a year of good rainfull?-Yes.
- 111. Q. In a year of good rain you close these channels?
  —I close these running down here, Karh Molimit (mop);
  this one (map), Arch, I beve left open. It is a 16 feet
  channel.

WITHESS No. 41 .- BABU GHUBAN SINGH, Collectorate Sherishtadar and Rayat of Jogyara.

- 1. Q. (The President.)—You are a resident of this district, I understand?—Yes.
- 2. Q. Do you know the agriculture of the district; you have enlitedted land of your own?—Yes.
- 3. Q. Do you think the country requires artificial irrigation introduced into it ?-Yes, it does.
  - 4. Q. In what paris?—The northern paris especially.
  - 5. Q. It would not require it every year ?-No.
- 6. Q. About how often?-Every third or fourth year regularly.
- 7. Q. Would the onlivating closes be willing to pay for it?—I don't think so; the well-to-de persons would be able to pay, not the poor.
- 8. Q But they would guin something by, it?-In that cose they would pay.
- 9. Q. If u man gets water he will gat a better return; is it not reasonable that he should pay something !—Yes.
  - 10. Q. They pay a road cess in this district?—Yes.
- 11. Q. Every year?—The rayets pay the maliks and the maliks pay Government.
- 12. Q. Would they be willing to accept on irrigation cars of about a quarter anna on the rupeo?—They may.
  - 18. Q. Every your?-Yes.
- 16. Q. Or would they profer paying a larger water-rate when they use the water !—No; an irrigation cess would be much better.

Babu Ghuran Singh.

30 Oot. 02.

Babu Ghuran Singh.

- 15.4. Have you seen the country near the Kamla river which Mr. King has irrigated by these cuts?-No.
- 16. Q. Do you know the country on the Dhaus !- No.
- 17. Q Is there much irrigation done by pains from the rivers in this district?—Yes. 30 Oct. 02.
  - 18. Q. Have these led to many dispates?—Yes; come-times one rayat does not allow the water to go into the landa of another rayat.
  - 19. Q. Do they go into Civil Coarts?-Yes, and also to the Criminal Courts
  - 20. Q. Do you think it would be a good thing if the Collector had power to deal with these eases ?—Yes; it would be much better.
- 21. Q. Is there any mency spent in keeping these pains -No. When there is a dry season they are dag, and when the season is over and the lands irrigated they all fill ap; these pains are worthless; the big pains excavated by the Maharaja are somewhat useful and lasting.
- 22. Q. I see a great many tanks in this district; are they ared for irrigation at all?-Yes; sometimes the malike don't allow it.
- 23. Q Are they kept for watering cattle?—Yes; when there is scarcity of water the malike etop other rayats from asing the water oven for cattle.

Apres Teleston

WITNESSES Nos. 42, 43 and 41. - Mr. S. Rout, Ma. Gond Churk Singh and Mr. Premasware Rout, Cultivaters

Mr. S.

Rout,
Mr. Guru

Archive Group. List year the rainful here was scanty and the cultivation suffered vory much. Rice is Mr. Guru

Charn Singh If a canal was unde we would take water. The Nepalese hand the water are we would make our or the Nepalese. and Mr. band the water, or we would make our nwa canals. We Permassari cometimes pay the Nepalese to out their bunds. Mr. Wilsoo, Rond. Manager of the Charant Mahans, has mada a canal from which we get great benefit. We pay the Nappless Rs. 5 or Re. 10 to open their bunds. If Government makes a canal, we would pay when we took water, but the people would not like a permanent cess.

If there is no rain in the hathia, it is a waste of time to work at our orups. If there is no rain in the hathia, but there is rain in Chitra, it is useful, but it is not the

In the hathia this year there wer some water, but last rear it was almost dry, and we het our rice except where we lifted water on to the lands from tanks. Last year we could not moke arrangementa with the Nepalese, as they wanted the water for themselves.

## WITKESS No 45 .- MR. A. S. SHEBMAN, Farmer, Jainager.

Mr. A S. Sherman, a farmer.

- 1. Q. (The President )-Are you a planter ?-No; I am
- 2. Q. Near the Kamla river ?-Yes. 30 Oct. 02.

3. Q. You have heard shout the proposed canals from the Kamla; would they benefit your lands?—Yes.

- 4. Q. The estimate is about 104 lake of rapecs; one cannot expect Government to spend that money unless there is some return. Do you think the people would like to have a water-rate for the time they used the water, or would they prefer an unnual cess like the read cess?—I think they would prefer to pay an onanal cess.
- 5. Q. Do the people about this district wish to have irrigation?-Yes.
- 6 Q. Is there any point you would like to represent about irrigation in their lands and how they could be benefited? - They would vought by o canol.
- 7. Q. Have you known the Kamla river for a great number of years !- Yes.
  - 8. Q. Is it ever bunded in Nepal?-Yes.
  - 9. Q. Ie water stopped altegether P-Yes.
  - 10. Q. Does that often happen ?- Yes.

- 11 Q. (Sir Thomas Higham.)—They don't boud the whole of the water up?—Yes, the whole.
- 12 Q. (The President) .- Are they is the habit of deing that pretty often ?-Yes.
  - 13. Q. Are you referring to the main Kamia river?-Yes
- 14 Q. Is it often bunded up by the Repai people ?-Yes, and it is also done by a mahant.
  - 15 Q. Io British territory ?- Yes.
- 16 Q. Do the Nepal people close the river altogether? I have heard eo.
- 17. Q. (Sir Thomas Higham.) Is it ever dry ?-- Yes.
- 18. Q. Wheo ?-In April and May.
- 19. Q. (The President.)—Do you think they would hund it at the time of the hathia ?—No.
  - 20. Q. Wby?-Because there is too much water.
- 21. Q. (Mr. Allen.)—Do you think it would be quite impossible for the Repulese to bond it in October?—Yes.
  - 23. Q. Why?-Because the river is already rising.
- 23. Q Do they ever begin before April to bund the river ?- Yes, at the latter and of March.
  - 24. Q. Not before that ?-No.

WITNESS NO. 46 .- MR. P. T. ONBAET, Manager of Zamindari.

Mr. T. P. Onraet. 30 Oct. 02.

- 1. Q. (The President.)—You are a landowner, I understand?—I am the Manager of the Madhnbani
- 2. Q. Would your lands be benefited if the Kamla Canai were made?—If the Kamla Canai were extended to the Bolan so as to connect the two rivers and distributaries made to the west of the Bolan.
- 3. Q. What about the Bolan having moved six miles?—The big Bolan has not moved six miles in my zamindari; it used to go near Lokhai, but now the Bihool and Bolan have become one river. A great portion of the Bolan river runs through the north-enst portion of the district and hos remained stationary for a great number of years.
- 4. Q. Are the lands, you are interested in, on the banks of the river?—Yes, some of them are.
- 5. Q. Does it cause you any anxiety?—No; what it cuts on one side it makes up on the other.
- 6. Q. Do you know anything of the Nepaleso bunding the Kamla?—No; I hove heard of it casually.
- 7. Q. Have you reason to believe that in the Kamla river there would always he a supply of water for irrigation there at the time that it is required?—Yes.
- 8. Q. October is the most important month bere?-Yes, and end of Septembor.
- 9. Q. Supposing irrigation works were carried out, would the people be willing to pay n water-rate or

- have n cess?—I think myself that n water cess would be the hest thing, but the poerer rayets who have no paddy lands would grumble at having to pay it; they would gradually get used to it.
- 10. Q. Is the road cess much in this district?-Half nn nnas on the rupeo.
- 11. Q. How should a work like this be carried out; under the Public Works Department, or should the local outhorities manage it?—It it is going to be a big work, only the making of a number of distributorics, it should be done by the Public Works Department; if it is a email thing like the hunding of existing channels, it might be done through the District Board.
- 12. Q. (Sir Thomas Higham.)—Do you know anything of the land on the Kamla? Is it liable to be flooded by spills?—No. Bolan No. 2 is the one that affects my zamindari.
- 13. Q. You don't know whether that country is ever under spill?—I have heard that when the Kamla river does spill it comes to Madhubani, but I have never traced the source of it.
- 14. Q. (Mr. Mair-Mackenzie.)—Is it possible to do very much in the way of bunding up irrigation channels?—Yes, I think so; there are nullahs that cut into little Bolan No. 2; if embaukments were made neross them and the water kept as in a resorvoir, and small pains made, irrigation could be carried on.

Onract.

30 Oct. 03.

15. Q. Why has nothing been done hitherto?—Because the zamindars don't care to spend money; they cannot get mything more from the rayats, and the rayots are too apothetic to spend money.

į

1,

Salan Canalia.

- 16. Q. If a rayat got an increased produce, could not the zemindar get anything out of him?—The rayat objects to pay anything that is not down on his jamabondi.
- 17. Q. Would he not get something down in his jamabandi on account of on improvement made?—It might be done, but not willingly; not without recourse to low.
- 18. Q. Supposing you have a bad hothia and were -given water not later than the first week of November, would it not save the crop?—If there had been scanty rain before, the rice would be all parched up.
- 19. Q. You don't try bunding up your rivers in years of scarcity?—Only perfunctorily. I have not

mode channels like Mr. King. I think that is a very Mr. P. T. good thing.

20. Q. What has prevented you doing it?-It is a matter of expenditure.

21. Q. Have you had fomine in your part of the world?—No; not even in 1897.

22. Q. You didn't hove occasion to employ relief labour?—Government only made three or four tanks.

23. Q. Wero they usoful?—Yos; they irrigated largely from thom this last sooson and pumped them dry: the tanks soved many acres.

24. Q. Wore they dug primarily for oattle?—Most of our tanks have been dug from n religious metivo originally.

25. Q. I refer to work done in the fomine?—It was first for the sake of fumine relief work; they will do for cottle-watering purposes in future.

# WITNESS No. 47 .- Mr. A. W. WATSON, Sub-divisional Officer, Madhubani.

- 1. Q. (The President.)—You are in charge of a sub-division in this district?—Yes.
  - 2. Q. Have you been long here?-21 years.
- 3. Q. You were here throughout the lost famine?—No. I joined in 1900. There was only scarcity last year. I was away from August to Novomber. The scarcity, however, did not develop till after November.
- .4. Q. Where is your sub-division?—In the north-east, 24 miles from head-quarters.
- 5. Q. Is the Kamia scheme in your part?-It will tun through my sub-division.
- 6. Q. Is there any wish for irrigation there?—As a matter of fact, the rayats are entirely anathetic; they clamour for nater when there is searcity, but they are never willing to do anything on their own account; they expect you to provide oven labour.
- 7. Q. Have thore ever been any famine relief works since 1896-97?—Thoro was a special District Board work in the north-east during the spring of the current
  - 8. Q. Did that draw !- Not much.
- 9. Q. Was there dire need?—No; there is always a submerged tenth boardering on distress.
- 10. Q. So there is in London. Would these people accept a water cess?—If introduced gradually I think they would.
- 11. Q. Probably it would not exceed half an anna on the rupeo?—Of course the vast proportion would not at first willingly accept anything, but they might be induced to do so gradually.
- 12. Q. Would that be better or worse than a water-rate?—I think a cess would be much more satisfactory. In the three roins that I have known here there has generally been a break about twice in 20 days; and during these breaks rayats would be glad to take water even in normal years. They would not really want a large quantity of water more than once in four or five years.
- 13. Q. Is there any land in your sub-division under well irrigation?—Very little, and that is confined to opium. This is in the north adjacent to the Nepal frontier.
- 14. Q. Is there any demand for wells up there?-No; I don't think so.
- 15. Q. I suppose the opinit people give advances?-
- 16. Q. The famine relief programme is kept up at the head-quarters of the district, I suppose?—Yes, the Collector has it.
- 17. Q. (Mr. Muir-Mackenzie.)—Are you consulted as regards works to be put into it?—Yes, as regards my sub-division. While on tour Mr. Maddex and I made anguires about possible channels.
- 18. Q. Do you suppose, if you romained several years and carried out these works, you could find other things of the same kind?—The difficulty would be with the smaller landlords who are extremely non-public-epirited; with the exception of the Muharaja, no-body would give land for channels.
- 19. Q. Would the acquisition of land be expensive?
  -Yes, very.
- 20. Q. Huvo you power to distribute takari advan-e?—No. Some applications were made to me this

year; most of them proved to be mald fide. Numbers of people came in after Mr. Maddox's visit to the distressed area in the north-east, in the hope that money would be get.

30 Oct. 02.

21. Q. How far did the people come?-Mony from nearly 50 miles.

22. Q. They would not consider 50 miles too much if they thought money was to be had?—No, certoinly not and they paid Re. 1 and Rs. 2 to mukhtars for writing applications; many intended to lend out the money to others at a higher rate of interest.

23. Q. As regards well irrigotion for opium, do you suppose that would have been done if the opium people did not appreciate it?—No, opinm cultivation has been pushed a good deal.

21. Q. They have also pushed irrigotion?—Yes, no doubt.

- 25. Q. Has the increase in cultivation been largely due to irrigation?—I think so; it has proved very profitable.
- 26. Q. Would udvances be largely avoiled of for load improvement purposes?—I think so.
- 27. Q. For really bond fide purposes?—Yes, provided the efficer took sufficient trouble in the matter; the people would require constant supervision.
  - 28. Q. Is there any sugarcane grown?-Yes.
- 29. Q. Without irrigation?-Yes, a good doal is without irrigation. One factory has token to irrigation last year.
- 30. Q. How did they get irrigation there?—They lifted out the water from a neighbouring river and rou it in small channels.
- 31. Q. Previously had that lond grown sugarcane without irrigation?—Previously it had been indige lond.
- 32. Q. Do you know the area of this irrigated sugor-cane?—It is not very great.
- 33. Q. Not 100 neres?-Perhaps a couple of hundred
- 31. Q. Besides that there is a good deal of unirrigated sugarcane?—Yes, a good deal—some 8,000 acres. 35. Q. (Mr. Allen.)—Do you know about this scheme of Mr. Maddox's—the Behul and Karak scheme?—
- Yos. 36. Q. Wes there searcity last year?-Yes, along the frontier line from Lokelli to the north-east end of
- 37. Q. Did you discuss this scheme with the natives?

  No. but I got all particulars concorning it from Mr. Rennie, Raj Sub-Managor, in that aree.
- Q. 38. (Wr. Muir.Mackenzie.)—Is there much scarcity in Nepal? Do the people ever come over to your side?—Sometimes, and sometimes our people go over
- (Mr. Maddox.)-I think our men are more likely to go to Nopal.
- (The witness.)—A great many of our people go to Nepal, especially in the dhan-cutting season. We are not bothered with immigrants, but only with habitual thieves from across the berder, who constantly commit burglaries on our side.

30 Oct. 02.

# WITNESS No. 49 .- Mr. J. H. Kenn, Settlement Officer, Durbhauga.

- Mr. J. H. 1. Q. (The President.)—You are Settlement Officer in Kerr. this distrist?—Yes.
- 2. Q. Havo you been long here?—Yes, four yoars; 30 Oct. 02. oue year as Sub-divisional Officer in Madbubani.
  - '9. Q. I suppose you know the whole of the district?-
  - 4 Q. Have settlement operations been going on all through the year?—Yoe, sloce 1897; they are just huished how.
  - 5. Q. What is your opinion about providing for the fecurrence of future famins; a country like this suffers from extreme scarcity at intervals; should not irrigatism works be provided?—Ye, if possible, to do it at a reasonable cost, it would be an excellent thing.
  - 6. Q. Would the people take to lt?—Poople would take as much water as you gave them if the hathia failed, but in an ordinary year they don't require it and would not pay.
  - 7. Q. Are you familiar with the north part of the district?-Yes.
  - S. Q. Are the streams steadily bunded in the Nepal territory ?-- Yee, the Dhausis; I have never seen the Kamia absolutely dry.
  - 9. Q. Have you any sort of reletions with the people seroes the frontier?—Nepalese Subadara comotimes come across to see us.
  - 10. Q. Are they friendly?-Some are; some are very hangity.
  - 11. Q. Do you think there is room for earrying on irrigation works as a source of benefit to the Province?-Yes, certainly.
  - 12. Q. This difficulty about the bunding is a very serious one?—The Kanila could not pessibly be bonded in the fains; perhaps it could be bunded in Cotober; certainly not in September.
  - 13. Q. As regards levying a cess lu return for water given, do you think that would be accepted without a tremendous stronglo?—It would require legislation.
  - 14. Q Assuming that there was legislation?—I don't know about the people who are not benefited by irrigation; the cest could only apply to the tract where irrigation was affected; then there would be villagee in that tract which could not get water, and there would be rayats whose boldings were composed of lands that could not be reached by irrigation and these would have to be excepted.
  - 15. Q. (Mr. Muir-Mackensie.)—These otalistics of irrigation given by Mr. Maddox; ato they taken from your Settlement Report?—Yes.
  - 16. Q. The great bulk is in the Madhubani Sub-division. What is the difference in the conditions of that district from the ro-t?—Irrigation is available; there are more rivers. In the Sudder Sub-division there are more jhile where the water logs.
  - 17. Q. You said that there would not be ony willingness on the part of the people in ordinary years to pay a water-rate?—Yes, I think the ravats would take water in an ordinary year, but would not pay for it.
  - 18. Q. Mr. King said about 2 to 4 onnas might be gained in profit?—Even if this is correct, I don't think it would induce the rayats to pay for water in ordinary years.
  - 19. Q. Don't you think it is right thuy should pay?— Yes, if they henclited: e.g., if the water enobled them to plant out earlier than would otherwise he possible.

- 20. Q. That would be of use to them?—If they de take water at all, I blink they would prefer to hang on on the obsuce of soin.
- 21. Q. Mr. King said they would take water?—I don't think they would take it if they had to pay.
- 22. Q. Do you think there are a number of places in the district where irrigation could be improved from existing channels and new channels extended?—I am unt compotent to eay. I think that would be the best thing. I think, if something more could be done in the way Mr. King bes done things at small expense, the practical effect would be better.
- 23. Q. Madhulani does not seem to have been the most distressed district ?-No.
- 24. Q. (The Precident.)—Are these tracts that we see so full of water dry in the famine year?—I don't know. I was not here. I believe so.
- 25. Q. (Mr Muir-Mackenzic.)—Overthe existing rights of water in these private irrugation works there are many disputes; are there not?—There are disputes over tha bunds.
- 26. Q. You don't record the rights?-No-
- 27. Q. Do you think it would have been a part of your besiness to do so?—I doubt if the righte ore sufficiently determined
- 28. Q. Would it be a good thing to enquire into thematter and record the rights?—I now not clear what there is to record. This place is not like Gyo where rights are fairly well defined.
- 20 Q. Would it be worth while to record them in districts where they are sufficiently determined? Yes.
  - 30. Q. They would save disputes?-Yes.
- 31. Q. (Mr. Rajaratna Mudaliar.)—Have you power under the present law to enquire into rights in water and prepare a record of these rights?—We record fishery rights. We are not told to record rights in water,
- 32. Q. (Mr. Muir. Maclenzie.)—There are no legal obstacles in the way?—No.
- 33. Q. (Mr. Allen.) Do you know the Gya District? -Yes.
- 34. Q. If it was proposed to give the Collector power to animarily decide disputes regarding channels, do you think it would be good, or would you wait till the record-of-rights of different people in the channels had been made? Ho you think the Collector would be able to decide disputes in the absence of the record?—If he personally unquired into overy dispute himself.
  - 35. Q. Ordinarily speaking he coold not do so?-No.
- 36. Q. Could be get at the truth by sonding out a subordinate?—I think he would be greatly assisted by a record.

12.

- 37. Q. It has been proposed that the Collector should be given power to compel the isodiord to maintoin the gillandazi, where they neglect to do so; would that be practicable? It was proposed that he should be given an allotment and carry out the work bimself and recover from the landard?—I think it would be to the becefit of the land-lord.
- 38. Q. Would the Collector do that is practice, if it was supposed that the zamindar was not maintaining the irrigation works properly P—I don't see why he should not do

## SIXTH DAY.

# Durbhanga, 31st October 1902.

WITHESS No. 49-Mr. H. A. RENNY, Sub-Mansger, Durbbonga Raj.

- Mr. H. A.

  1. Q. (The President.)—I understand that you are a Renny.

  resident of this district?—Yes.
- Renny.

  2. Q. Have you been here a long time?—I have been 31 Oct. 02. bere 22 years.
  - 3. Q. Have you an intimate acquaintance with the northern part of the district P—Yes. I have always been stationed there.
- 4. Q. That is the part that is most liable to drought and scarcity ?—Yes, the northern portion of it is.
- 5. Q. There were two schemes discussed yesterday—the Dhous and the Kamia. As regards the Dhaus, a very important consideration seemed to me that the Nepal people could turn off the water whenever they pleased, and that just at the time it would be most necessary in this

district; it would be most necessary in Nepal; and that, therefore, we could not count upon the water when it was wanted mast. Would that be your own experience?—That is not my experience. I have never known water not available. There are five rivers running through my pergunual, and they are all more or less fed from Nopal. I um not now talking about the Dhouse, but about the rivers in Phulpams. The rivers I am acquainted with are these running up to the Barra Bolan.

- 6. Q. You say that the Nepal people nover bund these rivers I have never known them to do so. They aro, too hig, I think, to be bunded.
- 7. Q. (Sir Thomas Higham.)—Supposing you were to make works here, what is to prevent the Nepaless bunding the rivers hereafter?—I fancy we have get no control over them at all.
- 8. Q. If we taught them how to bund rivers here, they would prohably follow our example and do it there?—I dare say they would.
- 9. Q. (The President.)—Is the want of irrigation seriously felt in this country?—It has been felt on more occasions than one. In the famine of 1874 this portion of the district was the chief sent of it, and last year, if it had not been for rain in March and April, there would have been another severe searcity.
- 10. Q. I suppose people would not take water every year?—Most of them would take some water on the high lands.
- 11. Q. For their rice?—For their rice and for their rabi and for their bhadei too.
- 12. Q. And would they be willing to pay for it P-When I sent up the project as an original project, they were willing to pay four annas an acre.
  - 13. Q. As a water-rate ?-Yes.
  - 14. Q. That does not give very much !- No.
- 15. Q. Do you think they would accept a sessment?—I cannot say. I have not sounded them on that point. I have not contemplated a cess. I have always thought of a waterrate.
- 16. Q. Do you think there would be a domand for water oftener than once in four years?—I think it would be offener.
- 17. Q. Have any engineers ever been up here and looked at it from an irrigation point of view?—Before my time Mr. Finneauc, who was here, started a scheme which you have seen, and subsequently Mr. Barton has been all over the pergunah.
- 18. Q. Is any one of them which you would particularly recommend ?-1 think Mr. Figurano's project would be the most usefel one.
- 10. Q. (Mr. Muir-Mackenzie.)—What was Mr. Finn-cane's scheme?—The Baikul-Karag scheme.
- 20. Q. (The President.)-I think, in the absence of any thoroughly worked out scheme, what we have chiefly got to

do is to enquire whather it is necessary or desirable to have irrigation there and to spend a certain amount upon it, Renny. wastnor the water is available and whether the people would appreciate it enough to pay something for it. If these points are settled in favour of the irrigation, then we would say there is a prima facie reason for taking the thing up and examining it thereonely. Yan say the Nepal people have never bunded up these rivers?—I have never known it.

- 21. Q. You say the people would pay a water rate of five annua an acres Yes.
- 22. Q. You cannot say whether or not they would consent . . to any oess?—I have not gone into the cess question.
- 23. Q. And do you think distinctly that it would im-rove the situation very much if there was irrigation?— Vory much.
- 24. Q. And it would increase the value of land?—It would increase the value of land and bring it more under cultivation.
- 25. Q. Is there much waste land?-There is a good deal in the northern part.
- 26. Q. The rivers are large ones?—The Bolan is a very large river; the Panei is a large river; the Bihwal is not a large river.
- 27. Q. Is it the case that the liolan has moved 6 miles? It has moved 6 miles and now it has amalgamated with the Bilimal.
- 28. Q. Do these rivers sprawl over the country, or have they their own beds?—They have got their own beds, and that is what makes the project so much easier I have thought.
- 20. Q. The Bolan has not kopt to its bed ?—No. All the others have kept to their beds.
- portion of the perguanah; there is not to the eastern portion, 30. Q. Is there much rabi cultivation ? - To the western
- 31. Q. (Mr. Muir-Mackenzie.)—About the movement of the Bolan do you know where the movement commenced? Has the maxement taken place south or north of Saswa?— North of Saswa.
- 32. Q. (The President.)—Sir Thomas Highma suggested that if Nopal should take it into their head to bund any these rivers, there is nothing to prevent them?—I have already answered that question. I am not sufficiently acquainted with Nepal, but during my experience of 22 years there has been no difficulty of that kind.
- 33. Q. What one would like to know is whether there would be any inducement for Nopal. The question is whether they have the cultivation there?—They have get the cultivation. They have get the dhan country running along the foot of the hills.
- 34. Q. (Mr. Allen.)-Is it within your knowledge that rice cultivation is spreading in Nopal?-No, I do not think so.

WITSESS No. 50 .- The Ho'ner Mr. D. B. Honn, Chief Engineer to the Government of Bengal.

- 1. Q. (The President.)—You have heard all the ovidence given at Bankipore by Mr. Toogood and other engineers. Are there any points in which you disagree with them?—No. I think all their evidence is very accurate.
- very accurate.

  2. Q. I wanted to get out what the country would have to pay for the luxury of navigation in the Sene Canale, and I anderstood it was about 20 per cent. of the total?—That is about the nearest approximation, I think, we can make. Navigation added about 25 per cent. to the cost of the Sone Canali. The locks cost about 30 lakhs, and I should say we could easily put dawn at least 20 lakhs more for other savings. Then for maintenance there must be a large percentage. There is all the lock establishment, and renewal of lock gates, etc. Gate renewal servery expensive. The cost is not so much in the Sone Canals, as it would be in the tidal causes. The destruction of gates in tidal canals is very great.

  3. Q. We asked Mr. Toogood whether anxigation
- gates in than candle is very great.

  3. Q. Wo asked Mr. Toogood whether invigation was very much appreciated on the Sone Canals. Ho said "yes, the people like it." But his answer was givenin a maunor which led me to believe he was not very enthusiastic over it, and that he did not take it as a very great boon to the country. Do you consider it has been appreciated largely?—I don't think so. Of course it has been a convenience to the people to

have steamers running up and down the canal prior to the introduction of railways to the south. I might; however, say that, as far as the parigation is concerned when I was at Buxar in 1887 I built a now gola at Sassaram and exporters would not use the gola.

- 4. Q. What do you call a gold?—A store-house, for grain. I thought exporters would bring their grain to be packed and sent down to Buxar by canal. Instead of this I found they used carts and conveyed the grain down the Grand Trunk Road to Zammania in proference to the canal. I usked them why they did this, and they said "wa have got our bullocks and we have got nothing for thom to do. We prefer to use them intend of paying canal tolls,"
- 5. Q. (Sir Thomas Higham.)—Do you have bullock traction on the canalr—No. It is nil by hand. Navigation has been an absolute failure. I think, if we had made only one line navigable, it would have been sound; making all three canals navigable was a great mistake.
- 6. Q. (The President.)—About irrigation, you say the leases are taken up very readily?—Very readily, and of course the conditions are becoming more and more severe; we are getting more and more particular every year about the channels being properly kept up, and lease boundaries.

31 Oct. 02.

Mr. D. R. Horn.

7. O. What is exactly the basis of all leases?—We select a block. It may be all in one village, or it may be part of a village. If we have a very big village commanded by two or three distributances, we may have several blocks in it. Mr. D. B. Horn 31 Oct. 02.

8. Q. Would it embrace several villages?—No. a rule we confine a block on the Sono to one village.

- 9. Q. You have got varying rates of irrigation according to the crop?—Not for the blocks. We have one uniform rate; inside the block a man con grow sugercane, robi and rice.
- 10. Q. What does he pay you?—He pays as all-round rate of Rs. 2-8 per acro for the block. If he wants het weather irrigation for sugarceae, he has to pay an extra bet-weether rate.
- 11. Q. In the event of irrigation being very popular, and there being a demond for it, would it be on easy motter to raise the rates for the new lesses and make it Rs. 3 instead of Rs. 2-8 per cere?—We mean to do so when the existing seven-year leases fall out. I think they fall out next year.

· 12. Q. The whole of them?—A certain aumber will. We started seven-year leases in 1897. Formerly they

We started seven-year leases in 1897. Formerly they wore for five years.

13. Q. That will bring you presumably a considerable increase of reveaue. Do you suppose it will chake off many of the leases raising the rent?—I dea't think so. Our position is very strong. The villagers have got se accustomed to water and have realised its full value that I doa't think we shall have any trouble at all. We increased the rate about seven years age and there was no diminution. If you look at the list for the last 10 years, you will find that the leases are steadily increasing in aumher.

steadily increasing in aumher.

14. Q. What proportion of the whole irrigation is by lease?—I think about 85 per cent. Robi irrigation a varies enormously according to the senson. The irrigetion I am talking about is khorif. There is a proportion of rabi and sugnreane in the leases. They have get the right to grow rabi under the lease. When we started first of all the robi area was very large, but when the villagors found that they were niways ensured a supply of water, they have gradually converted robi lands into rice laads.

15. Q. Is the sugarcane on the inercase to any extent?—I don't think so. Sugarcane arrigation is not very much; we are restricted in the hot weather for supply. The Sone russ down to almost 300 cubic feet a second in May.

a second ia May.

16. Q. To go back to my former question, what proportion of the irrigation is by lease; about 85 per cent. you say?—I should say quito that of the lharif area is under lease. You heard, Sir Thomas, that the people are getting too mach water. I was very pleased to hear that. When we had the Irrigation Committee in 1837, things generally were all the other way; that is to say, we were accused of not giving sufficient supply. We shall have to proceed very ceuticasly with the Shahabad cultivators. They are very troublesome.

are very troublesome.

17. Q. I gather it is not the policy of the canal authorities to fill the ahars!—Not at all. That is how we came to such trouble at first. We admitted water into a lattle uadefined channel running iate the lease, and what the villagers did was to let the water into their ahors, and then when we tried to assess the lands, they refused to pay and said "this is not your water; it is rain water," and we had no proof it was act. Then we adopted the policy of no leases except to good blocks with defined village channels.

18. Q. If they came to you and said "we want to fill these ahase for what will you do it?" When you have water going to waste you may just as well store it in the chars!—We do fill chors when we are closing the conal in the hot weather. We put water into the ahors for drinking purposes and for cattle.

19. Q. Might it act pay these people and add to your revenae, if you said "our leases are at Rs. 2-8 per acre; besides that, if you have got an ahar, we will keep it filled for you for so much"?—We have most got our limit now, and all our five-year leases are irrigated from proper channels and proper outlets.

20 Q. Do you think they would not irrigate further and would not make their blocks higger, if there were store-houses for water in the shape of ahars?—I don't think so. It is a wasteful system of irrigation.

21. Q. I entirely agree with you that it is a wasteful system of irrigation in a case of short supply of water. But in a year when there is Same water going out into the Ganges, it might be just as well as to store

it, instead of letting it go to waste?-Wo don't waste . any water.

22. Q. During the floods?—We close down.

23. Q. During the lost year of scarcity, if your ahars had all been full, they might heve pulled you over this difficulty. Would it not have been an advantage?

—We have had a had experience of ahors. There is constant friction between the villagers and onselves about losing control of our weter.

24. Q. (Mr. Muir-Mockenzic.)—How exactly do you lose control of the water?—At first we ellowed water to lesses with imporfect villege channels, and the villagers used to take it down into these ahors and irrigate their lond which was not within the lense at all. When we tried to assess them, they said, "it is not your water; it is rain water." We could not prove it was not rain water. There might have been rain water in the ahor in an ordinary year.

25. Q. Could not you give water to the oher on condition that any new nrea irrigated from the ahar was charged for?—I think all the area pretty well commended new is under lease. I also understand that the ohers are folling into disuse.

- the ohars are felling into disuse.

  20. Q. It is in ovideace that you may have a large surplus of water in the cerly part of the year, mue then of the holhte when you may want every single drop you have got. If you could store the water in ahars in the early part of the year, you could guard to a certain extent against the eventuality of having all your water exhausted?—We have only had this experience once in 30 years, and I think, if we begin to let water nate the ahars again, we would gradually work back to the old system in losing centrol of tur weter. These ahars are scattered all across the country, and those of one villege are connected with those of another. It is a most complicated system. We have accepted this principle now that, if we lose control of our water, we cannot assess.

  27. Q. Mr. Toogood seemed hardly to have accepted
- 27. Q. Mr. Toogood seemed hardly to have accopted that principle?—I don't know. In the Eastern Sono it is very sandy soil.
- 23. Q. (Sir Thomas Highom.)—Are you speaking of ahars in the middle of a block or outside?—A block may be above the ohar or below the ohar.
- 29. Q. There is no objection to their filling ohars in the block?—But these ahars go into other villages which may not have a lease.
- 30. Q. What is your objection to charging a fee for filling them? I am not speaking of outside ahars, but supposing a man who had an ahar in a bleck came to you and said "I will give you a rupee if you fill this ahar." What is the objection to that?—I don't think he would come forward, and besides I say thet, once you lose control of your water, you are helpless.
- once you loss control of your water, you are helpless.

  31. Q. You would not lose control of your water in that case. The difficulty I see is what you say that when you irrigate from an ohor you cannot sey whether the ahar was filled by rain water or canal water. But if a mon comes to you and says "I have not got much rain water in my ahar, put a couple of feet into it, where is the difficulty?—We have tried selling water by volume, but I don't think it has ever come to very much. to very much.

114

- 32. Q. Before the hathia you have a lot of water?— Yes, there is never any lack of water for transplanting the rice.
- 33. Q. You have a great deal more water than you want before the hathia, and you don't seem to be able to de mything with it?—In a favourable year these ahors are filled by the rain, and the people won't ask for water outside the lease until the rains
- 34. Q. But supposing it were a dry year?—How are we going to know when the hothic is going to fail.
- 35. Q. You mean to say the people will not apply?

  —Yes. They have got these ahars and they always contain rain water in the season, and very likely they else contain water from our five years' leases. It is only in a very dry September that they fail and the villagers would never apply to have them filled until it was too Into.
- 36. Q. You don't sell water by volume?—Whea leases come in inte and we don't want to measure, we say "We will keep an outlet open for you for 24 hours at so much," but I think very little has been done in
- 37. Q. Supposing it were generally known that where there were no leases, if the people liked to apply for water for their ahars hefore the hathia, you would be prepared to fill them up at so much a thousand cubic feet, would they upply?—They won't apply before

the hathia. That is what led to our long lease system boing introduced. We found that these people would wait till the last mament until the middle of October and then they aften got water too late to benefit the crop for which remission of water rate had to be given.

38. Q. Would they pay a definite sum to have their chars filled up?—Filling the chars would only benefit the unlessed areas beyond the long lease area, and the villagers would never apply until the hathic had failed when no surplus water would be available.

39. Q. Why not let them apply far their chars far five years? Why nat have a five-year lease for chars also?—In my opinian this would be a retragrade stop in canal administration.

40. Q. You have certain years of drought. They are not vory common parhaps, but say they take place once in five years. You propose to reduce the size of your autlets and so raise the duty. Would not the pressure be greater in these exceptional years than you have ever had?—I don't think so. The people are very extravagant in the use of water at recent. present.

41. Q. The more yau raise the duty, the mare that tension comes on at the times of trial?—I dan't think so. They will know they have only get an authat open far a certain number of days and they will take good care to irrigate their hind within that period. At present the outlet is 10 days opened and five days closed in the hathia. We hape to reduce it and make it, say, nine days agen and six days clased. That will spare a good deal of water and emble us to irrigate more than we can now.

١;

1

42. Q. You will ultimately come to your limit?-Yes.

43. Q. You have got a very good duty out of that; 86 acres?—We only got 50 in a year of bad hathia.

44. Q. The canacity of canals is dependent upon tha amount of water you can get down your canal during the hathin?—It is only succe we have started to wark on the Sone system that we have found aut that fact.

45. Q. Yau said here that the average actually has been 86 neres?—Yos, 50 at the outlet, but all these duties that are based on the four months' discharge are quite misleading.

46. Q. (The President.)—We know that you are interested in the Karamaussa project. I suppose that if you can command the establishment, you will have it surveyed?—Mr. Toogood and Mr. Harris are going up in the middle of next month to see the sites. I have written to find out it any of the agents of the Muharajah of Benures knaw the country and whether it is open, so that I may have some contours taken to find out what the capacity of the reservoir is likely to be.

47. Q. (Mr. Mair-Mackenzie.)—I see in the month of September that in the Sassaram Sub-livision the average rainful is 7.15 inches. In the year 1892 it went down to 2.42. In a year like that would the people not apply to have their ahars tilled?—Na, 1 don't think so. In fact, as I say, their ahars are gradually being done away with.

and think so. In thet, is I say, then thous are gradually being done away with.

48. Q. (The President.)—To go back to the Karamnassa, I have not looked sufficiently at what plans there are. Do you comtemplate that it possibly length help the Sono system?—The original idea was to carry on the main western canal through Sassaram up to the Karamnassa and on to Mirzapore. This was stopped, because, as I said in my note, we had not sufficient water in the Sone so the Karamnassa project is now praposed. The Karamnassa is the river an the axtrome west of the district. Instead of taking the water from the Sone towards the Karamnassa, water will be brought from the Karamnassa back to the Dargaeti into all that Bhabua tract which we know is very lable to scarcity of rain. In Bhabua, in my note, I have shown that the hathia rain failed about 12 times in the last 20 years. If you go lower down into Midnapare, you will find there were anly two bad years and one doubtful year in 20; whereas, every alternate year in Bhabua has a failure of the rainfall which is required to bring the rice into car. to bring the rice into car.

49. Q. Ta go on to Champaran and Saran, this side of the Ganges, I understand that yan look on the Saran project as altogether a very doubtful one; I mean these canals from the Gandak?—They have proved most unsatisfactory, and I don't knew quite what the reason is. They have been working for 20 years, and I suppose one of the defects of the scheme was that there was no regulator in the sada. was no regulator in the sota.

50. Q. I gathered from one of the witnesses at Mazafarpur that at one time, when they wauted the canals opened in a lurry, the ahannals had silted up, and thus the opening did not occur till six weeks after when it was too late, and they did not care to take the

water. That could not have happened if there had been a regular establishmant maintained by the Government ar the District Board whose duty it would have been to see to the silt clearances. I don't think and has a right to say that it was a hopoless case, because it has not been very successful hitherto from want of management?—I think it is really worth while to investigate it and draw up some scheme that would bring it more into line with the Sone. You would have to construct a regulatar outside the embankment in the first place, but without a survey it is impossible to say what additional works are required.

51. O. From these rainfall statements I make out.

51. Q. From this rainfall statements I make out that every third year here is a year af drought. For instance, in Gopalgunga, in 20 years, there have been six had years, 11 good and three doubtful ones, which were pretty near bordering on the bad years?—Yes; and Gopalgungo is pretty central for this Saran District. I think from the evidence and from the rainfall statements it is clear that irrigation for the rice crop is necessary more frequently than the witnesses at Saran made out.

at Saran made out.

52. Q. I would even go further and say that the fact that the thing existed at all, being left ta itself without the controlling hand of an engineer, gives ane a fair reason to hape that in better heads it might be a success. What da yau think?—I think it is very well worth enquiring into. The Local Government has spent 7 lakhs, and I think wo might safely spend a little more mency in the hope of making the scheme a success. At the present nument all this mency is simply sunk and lying idle.

53. Q. Did Mr. MucCarthy any that gauge-readers.

53. Q. Did Mr. MucCarthy say that gauge-readers were kept up on the Gandak?—I am not quite sure that he is accurate in what he said about gauge observations in the Gandak. It is most essential to have observations taken in all rivers likely to be utilised such as the Kamla and Bagmati. I think the District Beards might spend a little money in this way. It would not cost much to have one or two gauges established on these rivers.

64. Q. What do you think of the Tribeni schemo?—
It is going on. Mr. Butler hapes to do very woll this year. The tract is unhealthy; it is foverish, and the coolies gave it a bad name last year. I think more perfect arrangements have been made this year for pushing on the work.

55. Q. How are you getting rid of the cross drain-age?—In some places the canal is syphoned and in others carried in aqueducts.

56. Q. Havo you get funds to earry it on as fast as you wish?—Sir Thomas Higham says we can get any money we like. We have get six lakes this your, but he says we need not be tied dawn to six lakes; we can get ton lakes if we like.

57. Q. What is the estimate about?—Rs. 37,91,000, including establishment.

58. Q. Do you consider this Tilari project pramising one?—I am ufraid not. From Mr. Maconchy's report it will be seen he is very decided and expresses himself very strongly against it.

50. Q. Thon what do you think of these three projects,—the Tilari, the Bakhiya and Pussa?—I am afraid they would fail just at the time water was required. They are small strongs and could be very easily bunded up above by the Nepalese.

60. Q. Mr. Muconochy in his report says:—"The Douse scheme may, perhaps, be placed in the same entegory: for, nithough there were two bunds across the nullah in Nopal, there were also three bunds in British territory, showing that there was some water to utilise for irrigation. What do you say?—Yes.

61. Q. What is to'r opinion a regard the Bagmutty?
—The floods are the great obstacle here. This canal rans right across the draunaga af the country and as it is not possible to construct flood ambankments in Nepalese territory the irrigable area cauld not be protected as is the case in Orissa.

62. Q. Thon you reserve your epinion about the Bagmutty till more is known about it?—I think the suggestion that Mr. Disney made is warth enquiring into. That does not interfere with the cross drainage in any wny.

63. Q. (Sir Thomas Higham.)—That is warking on the same lines as Mr. King has been daing?—Yes.

61. Q. You have spent Rs. 52,000 on pains and cuts for making these canals?—Yes.

05. Q. (The President.)—Do yau think there are any of these rivers we can leave ant of consideration at once, or do you think it is an apon question with regard to them all whether they can be utili ed?—I think these four—the Tilari, the Pussa, the Bakhiya and

Mr. D. B. the Dhaus might be obliterated, as they would fail Horn. just when required.

- Horn. 31 Oct. 02.
  - 66. Q. Anyhow you could put them in a second line 66. Q. Anyhow you could put them in a second line giving proference to the others?—Yes. As regards the Bagmutty, Mr. Buckley and Colons! Haig have elwaya admitted that a woir is essential across the river and therefore you must get as big an area as you can te irrigate. As far as I have read the old papers no one seems to have dealt with this question of carrying the canal across the whole of the drainege of the country which is itself liable to heavy floods.
  - 67. Q. (Sir Thomes Higham.)—You say there is seme scope for work of the same kind as Mr. King has been doing?—Yes.
  - 68. Q. That consists of carrying out works according to the exigencies of the season. They may go, I understand, for two or three years without doing anything with these canals?—Vory likely.
  - 69. Q. Then when they know thore is a demand likely to come on they sot to work and open a channel where it is required and make a bund?—Yes. After the scason is over they put a bund across the mouth to keep the sit out in years when the channel is not required.
  - 70. Q. The Public Works Department are aiming at making an arrengement which will involve a heavy capital cost, and then be more or less permanent. But for a work like Mr. King's work, you will require men on the spot nible to see at once what is to he done for the season, and who must be able to lay their heads on money of eace?—Quite se.
  - 71. Q. I don't know how such a schome could be worked except by a District Engineer?—That is how it should he dane. You could not drann of working it in any other way.
  - 72. Q. I den't see what is to provent its breeking down as the Saran canels have broken down?—The Saran canels have been working in very much the same way.
  - The President.—They had not got a Mr. King there?—That is the difference.
  - 73. Q. (Sir Thomas Higham.)—There is this danger, I suppose, that a season may come when you cannot get control over the water?—Yes, and when that time comes, then the question of a permanent regulator will have to be considered. Of course Mr. King was getting water all through September. His scheme has therefore got that great odvantage over the Seran cannals.
  - 74. Q. You could get water all through September in the Sorau canals?—Not to the same extent as he did.
  - 75. Q. There is lots of water in the sola. What is to prevent your opening the shices?—I should think there is a good deal of oilt in the sola after each freshet. He got supply from the main river.
  - Too. Q. You mean in Saran?—Yes. I don't think they ever opened the sluices until October in the Soron conels. They cannot bund the sola until the river falls to a certain level.
  - 77. Q. There is no reason why they should not be

    We have come to a deadlock now. The Government
    is not going to spend any more money on maintenance
    and the zamindars won't pay the maintenance charges.
    The caush are only opened now when the civil officer
    says it is obsolutely necessary to save the rice crop.
  - 78. Q. That is low they are never opened until October?—We did sanction the opening of them this year in September, because there was not sufficient water to do the transplanting, but we told them we could not open them in October again unless they paid some money for the cost of clearing the channels, se we are new absolutely at a deadlock.
  - 79. Q. They have paid nothing?—They pay no-
  - 80 Q. Are they open now? Has anything been done to shut the water down?
  - Mr. Hare.—They are open now.
  - 81. Q. You have not got your contribution?
  - Mr. Harc.—No, they may be closed now. I am not quite sure.
  - Witness.—I think they are closed. I could not be certain, but I think they must be closed.
  - 82. Q. Has any money been paid for this year or ever?
  - 83. Q. (Sir Thomes Higham.)—The Tilari project is probably hung up, becomes there is no certainty as to supply?—Yes.

- 84. Q. How much do you want for that?-50,000 acres is the area commanded; 200 acres of kharif to the squere mile would mean 60,000 acres.
- 85. Q. How much water is wanted?-300 cubic feet.
- 86. Q. Would it be possible to get that down in the Tribeni?—We are baving a lot of demands on us now for the Tribeni.
- 87. Q. I suppeso you could make it as lerge as you liked?—We propose to extend the Triheni. We have raised it up to 2,170 cusees but we have another demand across the Sikrana. I should like to get ocross the Sikrana and Tilari.
- 88. Q. You could not go across the Tileri?—I have no personel knowledge of the district.
- 8D. Q. Is it too late to consider the question of calarging the size of your syphoas, so that, if you want to carry out these doubtful schemes, you will get more water there? Supposing you put five or six thousand acres on to your estimate, the Tileri, Pussa and Bakhiya would mean another 30,000 acres, plus perhaps 30 squere miles across the Sikrana?—We would have to provide altogether for another 40,000 acres; that would be about 800 enhic feet.
- 90. Q. Your syphons are new devised for a full supply of 2,170 cusces?—Yes.
- 91. Q. They consist of 6 feet barrels. If you were to make all these harrels 8 feet, you could increase the capacity of the syphons by \(\frac{1}{2}\). It is not too late to do that?—No.
- 92. Q. Do you think it would be worth while deing that?—I den't knew if the money is available. It is cortnialy worth considering.

- cortnialy worth considering.

  Sir Thomas Higham.—I don't think there would be any difficulty in getting the money for it.

  93. Q. (The President.)—I suppose, if 40,000 cubic fect were wanted, you could have it there. There is no limit?—No, there is no limit; but we might have oventually, I cannot sny, to build a regulator.

  91. Q. Then you think it worth while to increase the size of the syphons?—I think so. We only provide for 200 acres to the square mile at present. It is said to he a good rice country and only wents to get water to produce 250 or 300 acres to the square mile.

  95. Q. (Sir Thomas Higham.)—You have not worked
- 95. Q. (Sir Thomes Higham.)—You have not worked up to that on the Senc?—No. We have only worked up to 138 acres to the square mile there.
- 96. Q. We have heard that the Saran canals have been known to irrigate 22,000 acres in one very dry year. Can you say hew they get held of the figures?—I don't know. I believe they did try to assess the rayets, but they could not realise anything.
- 97. Q. How did they try to realise?—I presumo they had some sort of measurement. But as regards that 22,000 eeres, I don't know how reliable it is.
- 98. Q. How is one to find out?—I dere say Colonel Hodding could tell us.
- 99. Q. The Irrigation Department put all these areas in their reports. Where did they get their figures from?—I don't knew.
- 100. Q. It is said that a portion irrigated by the Sone canols is never paid for; that it was outside the blocks; have you got mything to say about thet?—A rayat may pass water on his field to outside areas.
- 101. Q. How did he got the water on his field?-
- 102. Q. He lets the water go on to other land; that land got a crop and pays nothing?—These people may be equally oursions to get rid of the water before the hathia, so it would be a disodvantage then, as it might do harm.
- 103. Q. Does much irrigation go on in that wey that is not poid for?—I don't know.
- Mr. Mair-Mackenzie. Mr. Toegool sold there was a substantial amount in the Eastern Sone Division. I have since ascertained. It is about 4,400 acres a year
- 101. Q. (Sir Thomas Higham.)-You den't think that is an important question?—No; we have got our value for the water givea.
- 105. Q. In reference to the works that have been done on the Baguntty, do you recommend the cut being completed to see what could be done with it?—I think it should be enquired into.
- 106. Q. The District Engineer could say what he oposes to do with it?—Yes.
- 107. Q. I understand he wishes to work up in connection with these two rivers?—I don't think there is nay field work done. Mr. Disney's proposals ore not besed on actuel surveys; they are simply in the

Mr. D. B. Horn.

31 Oct. 03.

103. Q. Should it be done by the Public Works Department or the District Engineer?—It might be taken up by the District Board.

109. Q. (Mr. Rajaratna Mudaliar.)—With regard to what you said about the block boing drained, what is the area of rice under the Sone canals?—\$20,000 acres are irrigated.

110. Q. If all that water is to be drained, it would be capable of irrigating an appreciably large area outside the blocks?—Yes, the people don't want water when they let it go; they always want to dry their fields 15 days before the hathia begins.

.

111. Q. Does this water benefit the crops outside the block?—It does not; overybody wants to get rid of the water at the same time.

112. Q. The area outside the blocks are not likely to have over much irrigation; are they?

113. Q. (The President.)—Our experience on the Nile was that the water used in rice irrigation always washed a certain amount of salt from the soil and did harm if we attempted to irrigate twice with the same water?—I have had no experience of that.

114. Q. If you constructed drains to earry of water, would the people outside the block areas be induced to apply for water?—I consider the acres irrigated outside blocks unimportant.

115. Q. (Mr. Muir-Mackenzie.)—Mr. Toogood said that the amount of land that obtained water in this way was in one part of the Sene so great that it checked irrigation?—The eastern side is very backward and the soil is very sandy and uses more water; there is not the same held ever the water; whether it is due to the individual officer I nun not propured to say; it is 12 years since I left the Sene.

116. Q. (Mr. Rajaratna Mudaliar.)—If water is stolen have you no power to charge water-rates?—
If it was due to carelessaess on the part of the canal staff, I should punish them.

117. Q. You have a separate measuring staff and a separate staff for collecting; do you see any objection to the Doputy Collectors checking the measurements of the separate staff?—I don't think they could for want of training.

118. Q. Could not Deputy Collectors and Sub-Deputy Collectors be trained to check measurements?—With what object?

119. Q. For the sake of efficiency?—There is suffi-clent efficiency now. All our collections are get in in timo.

120. Q. It is a question whether the whole of the amount is get in P—Our men are better able to do it, though they may not check each individual field they know the area of the block.

121. Q. Is your block proporly domarcated?-122. Q. (Mr. Allen.)—You said that the cost of keoping up navigation on Sone was considerable. Would you recommend the abandonment of navigation on the Sone?—Not at present when the lock gates require to be ronewed it may be considered. We are reducing the number of men all round, but we must keep up the lock gates as they are. I probably exaggerated in saying that it costs a great deal. It does not cost on much as I at first imagined.

123. Q. You would not drop it altogother?—I certainly should not.

.124. Q. We have had some evidence about the small .124. Q. We have had some evidence about the small area of rabi irrigated from the Sono canals; don't you think, as a matter of fact, the rabi has been extinguished by the extension of aghani!—That is true to a great extent in the long loase areas, but if there is a bad hathic on all the western side of Shahabad, we get a large rabi area.

125. Q. The tendency of regular irrigation must be to cut down the rabil—Yes, at first it was 30 per cent, in every 5-years lease, now it is much loss.

126. Q. With regard to what you said about the Karamanasa, do you propose to inspect the Durgacti scheme also?—Yes, I don't think I shall be able to contour the reservoir site this season.

127. Q. Why?—For want of staff. I mean to try and get it done. I am not cortain what staff will be required for the Karamassa.

128. Q. Wo have heard of the prospect of investigating certain small schemes in the Terai similar to Afr. King's; have you a staff of engineers to do that work?—I am afraid not, but the District Engineers have got a good deal of local knowledge. I should require a survey staff as well.

120. Q. Have you the material to organize a survey staff? You have the Karamnassa, Durgaeti and other schemes along the Himalayas?—No. I think the District Engineers could give a good deal of assistance

130. Q. I think the answer is, you have not sufficient men?—Not to take them all up at one time.

131. Q. What class of men would you require, as regards these minor schemes?—Temporary surveyors, once having settled the lines on which we are going to work; it would not take long to survey and lovel these lines; the question is who is going to provide funds for the investigation. I have since decided to give money from Imperial and Provincial Funds.

132. Q. Mr King spoke about dotailed examination and personal trouble taken. It does not appear that the survey could be done quickly?—I think he refers to the distribution of water.

133. Q.( The President.)—Have your canal officers on the Sono canals get magisterial powers under the Canals Act?—Yes.

134. Q. Do they exercise these powers?—To a very limited extent,

135. Q. There are certain penalties for breach of certain sections of the Canals Act?—Yes.

# WITNESS No. 51 .- ME. L. HARE, Commissioner, Patna Division.

## Note on Irrigation Works.

1. I have nothing to add to the particular information supplied by the District Officers in their replies to the questions of the Commission.

2. I would wish to bring to notice the desirability of legislation to give power to the Collector to interfere in easo of the construction of bunds in rivers—

(a) In order to prevent disputes and rioting.

(b) To prevent pureasonable waste of water to the detriment of those who live lower down the river.

(e) To provent grave and meterial alterations in and diversions of the rivers which may seriously affect the country.

3. I would recommend definite recignition and acceptance for the principle that, in the case of schemes in which the demand for water is intermittent, and consequently the receipts from the sale of water are irregular and onecrtain, a cess should be levied on the lands protected by the

(a) The bonefits are so great as to secure ample return to the cess-payors,

- (b) The payment is in the nature of an insurance against failure of crops and famine which should be borns by the area protected.
- 4. It would be necessary to legislate. The amount of cess se leviable would be limited by the Act. It should be puid for five years at a time, and so calculated that, with the receipts from the sale of water, it sheald cover working expenses and a reasonable interest on the capital expenditure.
- 5. I would lovy the cess direct from the occupiers along with the demands for water supplied to the same manner as the present canal dues are levied.
- 6. This proposal would apply to schemes propared by Government. I would at the same time provide for the case in which application was made for irrigation works on lines corresponding to those of the Bengal Drainage Act, i.e. suitable suhtmes approved by Government would be carried out in a tract where the majority of the persons interested accepted the scheme.

1. Q. (The President.) - Mr. Maddox in his paper says: - "I notice that the total cost of famines since 1873-74 has been Rs. 76,18,274, excluding the snount spent by the Maharaja in 1876-76." That is in the one district of Mahamin in 1876-76." Durbhaoga?—Yes.

2. Q. Has there been fairly good value obtained for that P-No, oxcept as regards saving of life.

3. Q. Woold it be a fair test of the inteosity of famine in the different districts to compare the amount spent of relief works P-It will be much fairer in future, as there

Mr. I. Hare.

Mr. L. Hare.

- will be a Cammissioner appointed ander the Code to ensure a uniform system.
- Hare.

  4. Q. Are your programmes of relief works complete?—
  31 ('et. 02. I think we should have more schemes which give a promise of being really neeful, worked out is detail and kept ready. In the past famines we have been, I think, too apt to select works which were convenient and not those af real volue.
  - 5. Q. (Mr. Muir-Mackenzie.) That was, I suppose, largely swing to want of time?—Yes, to some extent, and also to the idiosystems of the efficer dealing with the enbject.
  - 6. Q. (The President.)—The tendency bes been more end more to give rollef in much lerger proportions?—It is much more difficult now to resist applications for relief.
  - 7. Q There was more relief in 1896 than in 1876?-No. I think it is the other way.
  - 8 Q. Are you satisfied with the system on the Sone Canale with the amount of revenue anthority possessed by the canal engineers ?—I think the system is working very well.
  - 9. Q Are the relations of the district and canel officers quite satisfactors ?—Yes, quite. When the Lieutenant-Governor went down the year before last there were crowds at every lock, but there were no complaints, merely petitions te get water e little eheaper.

10. Q. There were no complaints of injustice ar hard-sbip ?- No.

- 11. Q. Yen have no doubt of the importance of previding the Bhahue Sub-division with a supply of weter? None whatever.
- 12. Q. I think your epinion is that in the Saren Canels a cess would be acceptable?—I think so if you can show that you ere giving them value. Whether eccepted ar not, I think it should be levied if you can give them value. In that ease we would have to meet an outery, a paper outery, not from the people concerned; there would be strong objection is the Landau Constillation. tion in the Legislative Conneil.
- 13. Q. An organient used would be that all had to pay, although all did not beneat equally ? -Yes, that woold be one line. I should levy it locally if the scheme gave only
- 14. Q. In these eases, where irrigation would only be 14. Q. In these ease, where irrigation would only he taken at intervals of a few years, do you think that would be a prefeable way of raising Government revenue to a water-rate on the area?—If you had proper control over the water and a definite scheme, I would prefer a water-rate on the area, lovying so much on the water taken; hut if oet, I would prefer a cess on the whole district—every man would benefit. It must be a small sess of course.
- 15. Q. What should the meximum he?-Half an anna on the rupes to hegin with.
- on the rupes to negin with.

  10. Q. (Mr. Muir-Mackenzie.)—With regard to the s-verity of the finine, I see an enurmous difference in these figures that are given here as regards the numbers an relief in 1873-74 and 1896 97. For instance, in Durbhangs, the numbers on relief in 1873-74 was 55 million and in 1896 97 the figure was 22½ million. Was the famine of 1896-97 as severe as that of 1873-74?—I could not say. Plenters who were present at both any they were of equel assertive. severity.
- 17. Q As regards failure of crops ?-The feiture of crops was more severe in 1896 97
- 18. Q. Hes the opening up of the country by railways and greater facilities of communication made any great difference?—I think it has made a great deal of difference in the resisting power of the people.
- 10. Q. Can we take it that you ere not likely to heve a mans severe formire than you bed in 1898-97?—I think it is pessible you coold have a more severe famins if you had three successive had years.
- 20. Q. liave three bad years in succession over been known in the district ?-I den't think so.
- 21. Q. (The President.)—I suppose prices never rose in 1898-97 to the 1573-74 mics?—No The increase was not so great. The average prices ere new so much higher.
- 23. Q. (Mr. Muir-Mackenzie.)—In the fomice pre-gramme paper we are given proportions of the population for whom work is provided for each district. Are yeu entis-fied that their proportions are properly adjoiled to the requirements of each district? I find that I Muzaffarpur work was previded for 80,412 persons, and the average number employed in the famine of 1996-97 was 31,424?—I think the number provided for might have been lessened

- 23. Q. In Durbhanga also the number provided for is 23. Q. In Durbhanga also the number provided for is 176,830, whereas the number employed only works out to \$2,461. Again in Chemparan provision is made for 177,229 persons and the average namber in the famine was 68,685 full persons and the sverage namber in the famine was 68,685 full persons and the sverage namber in the famine was 68,685 full persons and the work would be wascaded out eventually. The idea is to leave a lerge margia.
- 24. Q. I suppose the ideal to aim at is to have no work that is not useful?—Yes I would even go to the extent of taking men away a considerable distance for good works. I would seerifie more to the importonce of the work.

7

#2.

- 25. Q. You don't think it is impracticable to convey people abent in this way?—No; in this district yen could take the cream of the labour away. The real labouring class are the first to rome on relief; these men are accustomed to travel about. That would leave small works to be carried and the influence of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contr out by inferior labour.
- 20. Q. Would you say that it is preferable to have large and extensive works and run the risk of people being on them whe did not require relief?—I would simply bring the people together, presuming that the work was accessary.
- 27. Q. I anderstend yen to wish to take edvantage of your good time to prepore a complete survey of useful works P-Ye- for such works as the Collector is not an expert upen; he knews reads, het net ennels.
- 28. Q. You want, if necessary to have the nid of professionel skill through the Public Works Dopartment for the purpose?—Yes, not only for relief purposes, but becouse I would like to take a few np in advance.
- 29. Q. Would yea like to see the Seran Causi works undertaken by the District Board?—I du not care who has the centrol, so long as the local officer has fall control and is not required to refer to Colcuttant erilical times. If there is to be a cess, whalever the proceeds they should be honded over to the District Beard.
- Mr. Allen explained that the law was an obstacle ia such a case.
- (Witness.) Where we have got to legislate for collecting the cess, we might as well by executive order prevent the District Beard spending its present cess on irrigation.
- 30. Q. (Mr. Muir-Meckenzie.)—Some of the planters mentioned that the District Board had lospend periodically large sums on relief works; has that actually been the case?—No, but Government has power to lasist en every penny golag to relief works. Sir Charles Elliott insisted on it in 1892, but Sir Alexander Meckenzie let them
- 31. Q. I understand the Beard slarle a work when famine is expected; have any substantial sums heen spent to that way?—In Murassarpur we spout something more than a lakh. I canaet remember the exect amount.
- 32. Q The District Boards seem to be lisble in years of moderate sesseity to be called uson to provide work which it might not want simply on the obsuce of people wanting relief?—Yes.
- 33. Q 1 there eny way of getting at the actual sams speat?—I think I can get thom for you.
- 31. Q. Has the Local Benrd always to set apart a sum on occurnt of this danger?—No, not nuless the warning note is given.
- 95. Q. In Shahabad I think you enid thore is no doubt of the necessity for irrigation 1s there any doubt that water will be taken?—In that I must trust the local mea. I think it will be taken. I did not go into the question, as I was teld that no reservoir was possible.
- 36. Q. De yea think they would pay the Sene Canel retes?—Yes.
- 37. Q. At oner?-Yes, I think so; they would not take n greet quantity of weter at first.
- 33. Q. I observe from the famine map that newbere through the enb-division was relief extended to more than eix per cent. of the population; is that not a sign that distress is never very intense?—They always live poorly. Every year they go away to get their living, not only in femins yeers.
- 39. Q. If the Karamnassa scheme is impossible, is there nny chance of saving the econtry by the extension of small works?—Yes, there are other schemes which might he gone into like the Dorgneti. Something could be dead also with pains and cuts into law lands.
- 40. Q. For the Gye District I understand there is no large work?—Ne; 'if there is a proper survey, I have no deabt a good deal of work could be found. large work?

41. Q. Some of the pains appear to be large works; would it be worth while to have the country anaveyed and put nader Government management?—The question of Government's interference must come up if the estates are subdivided mere and mure.

١.

- 42. Q. Do you support Mr. Oldham in his proposals on that point?—Yes.
- 43. Q. Do you support his proposal that the Collector should have the power to compel zamiudars to earry out repnirs?—Yes.
- 44. Q. For small chars as well as small bunds?—I should not use it if I was Collector unless the Executive Engineer said it was necessary.
- 45. Q. Would you give him an inspecting officer P.—Yes, I think that is necessary, because a Collector with the best intentions might do harm in pushing schemes which he thought good, but which really were not good.
- 46. Q. Would you like him in the case of pains to act in anticipation of complaint?—He would act on the complaint of the Inspecting Officer.
- 47. Q. I mean complaint on the part of the people?—I don't think that would ever happen.
- 49. Q. If the Collector is given this power, would he have in proceed aften to extreme?—No, not aften, but to give him the power which would serre a useful purpose.
- 49. Q. Do you think in a district like Gyn, with a let af complicated rights in water, it would be possible to have a record-of-rights P-I would have a record of the facts.
- 50. Q. You would not determine the rights?—No, I would allow the Collector to give an ad interim order; he might state the case and then it should go before the Civil Courts. There are some disputes he could not decide.
- 61. Q. Would it not be advisable for the proper husbanding of the water that the Collecter should by down how the stream should be divided?—I should not allow him to do more than pass temporary orders. He can determine all the facts but not the effects of the facts. I would not allow him to make a record-of-rights.
- 62. Q. l'atna, I understand, we may consider to be immune from fumine?—I do not think we can say that everything possible has been done. If the Collector were assisted by expert advice, he could got a great deal done by the people themselves.
- 53. Q. To recur to the question of a record-of-rights, in cases where a right of water has been made out and the existence of each a right obstructs the administration of the atream to the best advantage of the public in general, would you advocate that Government should have power to require the rights in that water, just as it can now acquire rights in land?—Yes, where a man had already a verted right, Government neight acquire a right to the balance over and abore what the insa could fairly apprapriate.
- 54. Q. If n man were obstructive, why should not his rights be taken away altogether P—That would be very expensive.
- 55. Q Nat necessarily more expensive than rights in land. You would give the man compensation for the appropriation and the value of the rights!—I would reserve to him all you possibly could consistently with using the stream to the best advantage.
- 50. Q. Regarding the repairs of pains and alars and other small irrigation works, is it generally the duty of the zamindar to repair P-That is the theory no doubt.
- 57. Q Has it been necepted by the Courts ?-I cannot say; I do not know of any case where the rayats have sought to get it enforced.
- 58. Q. Would the rumindars generally accept it if it came to putting it down in the record-of-rights?—Some would and some would not.
- 59. Q. Would it be safe generally to record it as the duty of zamindar? Yes, though they have shirked it a great deal.
- . 60. Q. Are there any daties on the part of the rayats in customary labour f-Yes.
- 61. Q. In Gya we heard of the gohan, a levy of lobour in cases of emergency. Is that the limit?—As far as I know, it is. I do not know the Gya District very much.
- 62. Q. Is that confined to the Gya District ?-There is, I think, something of the kind in Patun.
- G3. Q. In Saran in the famine I notice that the average number on relief for 1890-97 was only 14,000. That looks as if the famine must have been slight?—Yes. They belped themselves to a great extent by emigrating and sending back their money.

- 64. Q. Are there plenty of ontlets for that emigration?—The men went ent in large numbers, but did not all succeed in getting work.
- 65. Q. Have you been able to form any opinion as to the chance of geiting anything like a hundred thousand acres under the Saran Canal P.—No.
- 63. Q. Is there any reason to suppose that, before the embankment was made and when the channels were allowed to do their duty unimpeded, there was anything like that area under irrigation?—The cultivation must have been very different in those days. There most have been constant fleeds.
- 67. Q. There are no remains of any works of chars or pains?—No.
- 63. Q. (The President.)—They were devastating fleeds, I suppose P I understand so.
- 69. Q. (Mr. Muir-Mackenzie.)—Is there any reason to suppose that these embandments have really out off a very large amount of irrigation?—It has altered the nature of the country. There are no floods now.
- 70. Q. Were the floods useful? -Of course they strengthened the ground, but the people often lost their crops.
  - 71. Q. Did they bring down silt ?-Yes.
- 72 Q. In other parts of the country semetimes the flooded land is the only land where there is crop in time of famine. There is a considerable amount of well irrigation in parts of Suran P-Yes.
- 73. Q. 1s there any chance of a material extension?—I should think so, very considerable.
- 74. Q. What measures would you propose f-I would encourage rajats to take advances. A good many zamindars are rayats themselves with small heldings.
- 75. Q. To go to Champaran, when the Tribeni Caual is being made; will that fully protect the district P—It will make an enormous difference, but there was very large reliof given outside the Tribeni area.
- 70. Q. There will no doubt be a movement into the Tribeni tract during a famine?—Certainly I find that the effect of a canal extends to a considerable distance beyond the area actually covered by the canal. It means a great deal that within the canal tract all charity is not cut off.
- 77. Q. If you cannot say confidently that it will be a complete protection, it will be a very large measure of protection?—Yes.
- 78. Q. Do you feel confident that the people in Champaran will lake the Tribeni water in an ordinary year ?—I do not think there is enough cultivation to take it all at present, but the enlitvation will extend. The question is—when it does extend will the health of the district improve? At present the Saran mee, although they are so crawded, are very movilling to go up there. There must be a great deal of immigration from semewhere before the whole area can be taken up.
- 79. Q. There are considerable areas of waste and the country is annealthy?-Yes.
- 80. Q. Is water wanted very often there?—They cannot oultivate the whole of their holdings without it oven in ordinary years.
- 81. Q. Does Champaran differ very much from Muzastarpar and Durbinaga in that respect as regards minfall and the necessity of water?—Yes, but not very much. If it was cultivated, it would be much the same.
- 82. Q. We understand that in Marassarpur and Darbhauga the water is not wanted more than once in four years P—They would want it mere in Champaran. Northern Murassarpur and Northern Durbhanga do not depend ectirely on the rainfall. They get an enormous amount from floods and the overspill of the rivers. We have not had famine or scarcity there when, necording to the rainfall, we ought to have had one or the other.
- 83. Q. You would say that Champaran is more liable to scarcily than Durkhanga and Northern Mazaffarpur?—It is less protected by spill water, but the population is so small that they generally get enough to live on.
- 84. Q. According to the map there is quite as much distressed area in Durbhangs as in Champaran. There is hardly any dark-red area in Champaran?—It depends on the percentage of population relieved.
- 85. Q. What I want is to get at the grounds for the belief that water will be taken there and not taken lower down?—They are not provided for at present in Champunn; the rainfull is not sufficient there, and is fairly sufficient in

Mr. L. Hare.

31 Oct. 02.

Mr. L. Hare. the other two districts. I do not think the spill water in Champuran counts as much for the district as in the north of Muzasiarpur and Durbbanga.

31 Oct. 02.

86. Q. The large schemes for Muzaffarpur are not then very promising?—No.

87. Q. Would it not be advisable to usk that the feasibility of taking the Tribeni even further should be considered?—You cannot cross the Bagmuti with the Tribeni Cond.

- 89. Q. (Sir Thomas Higham.)—It would be an nunccessary expense. If you go into the Beginati, you will have to put up a weir; and if you make u weir, you can get enough water from the Bagmati itself. We must draw a line somewhere. I think it would be well tog up to the liegmati. It looks as if tha area to be protected by irrigation in Muzaffarpur is small?—By any hig saheme, yes.
- 89. Q. Do you think small schemes could coror a considerable percentage of the areo?—What I should like to know is whether the water can be brought into the chaure earlier in the year In anticipation of a possible failure of the rains. Take the Baya river. The spills from the Gandak river filled all the chaure and these gave off their supply to the Baya all through the year. The planters agreed it would be good to close the old breach and put a sluice in, and now they are of opinion that they have made a mistake; their many hos not only boon lost, but mischievously speat. Lot these schemes be locked into and see if we cannot do something to seeure water being brought in earlier in the year in case there may be a failure in that year.
- 90. Q. (Mr. Muir-Mackenzie.)—And something similar might be done in Durbbanga?—A good deel is the sadr sub-division especially.
- 91. Q. All these schemes seem to me to protect urens outside the eadr sub-division of Dorbhaga in which there was most distress?—There is an onormous orea of chaur sadr sub-division that was very dry.
- 92. Q. You hope that might be helped by some such scheme as you suggest?—Yes, by letting the water in the chaurs earlier in the year when the rivers are high.
- 93. Q. If water was put into the chapts earlier in the year and you had heavy rain afterwards, would the country be seriously damaged?—Not seriously, but there would be some injary. I do not look upon floods as a very serious injury on the whole. They are not very violent.
- 91. Q. Do you know the works which Mr. King constructed for the Muharaja in Durbhanga?—Not very well.
- 95. Q. You agree in the general opinion os to their great nectulnes and efficiency f-I accopt that.
- 90. Q. Is there any chance of the unterial extension of well irrigation in these three districts of Champaran, Muzastarpur and Durbhanga?—It is dillicult to say.
- 97. Q. Why is it not more extended than it is at present?—The pererty of the rayat and his unwillingness to incar a risk.
- 98. Q. There is no unsuitability of sail?—Not generally. It is not much good a man having a well if he has no labour to work it.
- 99. Q. You do not think there is room for covering the country with as many wells as the lest part of Samu has?—No. The soll is more suitable in Samu and there is more labour there.
  - 100. Q. Investigation is wanted !- Yes, distinctly.
- 101. Q. It would be a mistake to abanden hope of exteeded well irrigation without going more into the subject?—Yes.
- 102. Q. As to advances for laud improvement, you actually gave bounties for kachcha wells during this famine ?— Yes, about a rupes a well; they cost about two rupess. They coverd a good area in Sitamurhi, but not much elewhere.
- 103. Q. Would you give bounties for the construction of pakka wells in ordinary times? That has been seriously put before us?—I would if it were proved that they would be very useful in a particular park.
- 101. Q. The Opium Department apparently advance money without interest. Would you go so far as that f—I would not minil going so far as that if the survey showed that it was desimble as a good field for extension.
- 105. Q. Are you satisfied with the present system for the distribution of advances?—The Collector could do a good deal more if he knew his ground; if he were entistied that it would be a good thing to make a well in a particular place, I should always be cautious of pushing an improvement unless I was sure it would be a good investment for the man himself.

- 100. Q. But supposing the Collector wished to push indivances, could he not do it more effectively with a change in the system?—I think the present system serves well enough. There is no doubt a little obstruction, but it is very easily get over. The rayat won't take Lond Improvement money; he will Agrianitural Loans money. If he is going to give Rs. 200 for a well, he must be a substantial mon; that is, practically a ramindar.
- 107. Q. Wenld he not take advance for improvements if the lean were spread over a longer period?—That would mean continual respeciability, but it would be a help certainly. It is not so much the system that is at foult; it is the number of small men.
- 108. Q. In Bombay and in Madras not only the Sabdivisional Officers but the Tahsildurs ure empowered to grant advances?—I think they might be given power to make enquiries, but they should get the order of the Collector before making payment.
- 109. Q. Is It necessary to have the Collector's sanction?—You would lose a lot of money if you did not.
- 110. Q. In Bembay we have not lost the money. I do not say that it has not been used for other purposes. As a general rule, it is recovered without any sert of difficulty?—In the furnine we gave a rounsion of one-third for land insprovement works, and there was very little taken—under half a lake.
- 111. Q. Very much larger remissions were made in Bombay Presidency. There and in Madras remission of a hulf was premised in many cases. Could not the power go lower—to the Sab-Dopaty Collector?—He is generally in chorge of the treasury. We have only two men in the sub-division—the Sab-divisional Officer and the Sub-Dopaty Collector. We could put on a kannange. We used to necest his report in tha famine and he gave the mency out at once. But the real difficulty is the went of substantial mon willing to iccur the responsibility of taking an advance.
- 112. Q. The Opium Department succeeded in getting rid of a certain amount of advances for wells? Not a very large amount.
- 113. Q. Still it is larger than has been done oatside the department; is it not?—Yes.
- 114 Q. The Opium Department have adopted the principle of getting the poor people to combine. Could not you do the same?—It would be possible, but very difficult. In the case of the opium advances they are probably all taken by opium men and it is taken eventually out of the opium payments; and the man at the head of a gang has a good deal of contral over it. They are all practically combined in the oplum business.
- 115. Q. In the southere part of the Bembay Presidency all these things were said, but there happened to come a Collector who took up the subject very mach in earnest, and the advances immediately accreased enormously; and in Coimbatore, Madras, the raine thing happened; it is difficult not to hope that something more may be done by individual initiative. We got up from a few thousands a year to over a lakb?—Yes, I think a lakb could soon be got rid of here.
- 116. Q. (Mr. Rajaratna Mudaliar.)—Does the foar of enhancement of nee-sment by the zamindar doter them for No. Besides the man who tack it here would be nearly always more or less a zamindar. I do not think the tenant would be alraid of enhoncement where there is a record-of-rights.
- 117. Q. Where there is no record the fear does exist, I sappose?—I think so.
- 118. Q. In preparing your famino relief programme were you not guided by the circelar of the Government of India, saying that you should provide for relief for 20 per cent of the population for three months?—In preparing our famine pregrammae we put down every work we know of that could be of any use, and if it came to a bigger list than was octually required, so much the better.
- 119. Q. In 1896-97 over 362 lakks were spent in Durbhanga District on famine rellef. Gould you kindly tell us what portlea of it was spent on irrigation works ?—I could not; but I should say extremely little—next to nothing.
- 120. Q. Is the condition of the pains generally so had os to call for legislation to enforce upon the zamindar the duty of maintaining them in proper order?—Not generally. It is not so much that. It is the breaking up of the estate. It is more and more difficult to get thom all to ugree. One man stands out and blocks the improvement.
- 121. Q. So legislation is now more necessary than it was formerly?—It is growing more necessary, but not urgoutly necessary.

\*\*

- 122. Q. (Ar. Muir Makenzie:)—Mr. Oldhum seemed to consider it argently necessary in Gya?—Lagrecus to its desirability, but I do not think that the question is so pressing as Mr. Oldham says. Alr. Oldham, however, knowe more than I do about that district.
- 123. Q. (Mr. Rajaratna Mudaliar.)—Does the zamindar levy contribution from the teaants towards the maintenance of these pains or akars in Durbhanga P—No.
- 124. Q.. Where a pain is constructed by a zamindar at his cost, if the cost of maintenance is thrown on him, would you not let him lovy a cas to cover the maintenance charges P—I do not think it necessary:
- 125. Q. Do you think that the introduction of differential water-rates would be useful; that is, with reference to the facilities for water-supply and the suitability of the soil for irrigation?—Some lands in the lower reaches would not get the full benefit of irrigation, and uniform rate of cess will fall more heavily in one place than another?—It is theresteally sound enough; but it depends on the nature of the scheme.

16

) ]

1.11

47

<u>`</u>| '

- · 126. Q. Will you not be able to realize a higher revenue if you adopt a system of differential rates?—No doubt, if you press for it in places where the water is very much wanted. I do not see why you should not obarge as much as they will pay.
- 127. Q. In Madras and Bombay we have consolidated assessments ranging from three to twelve rupees. There we differentiate between the quantity supplied and the quality of the soil. Under a system of uniform water-rate that is not possible?—Whore you have a consolidated assessment, it is quite sound to make differences. But if you are simply charging for water supplied, you must charge the same price.
- 123. Q. Say a canal is 10 miles long. Why, should not you have a higher rate at the upper 5 miles and a lower rate at the lower 5 miles to get a larger revenue and make the incidence fair?—In the Sane Canal system you might charge more in certain areas where it might be herne, but I do not think there is may necessity for it.
- 129. Q. (Mr. Muir-Mackenzie.)—The rato for the Sono Canal could, without sny impropriety, he raised?—I think you ought to recover your expenditure, and if it he uccessary, to raise the rate to do so. It would be fair to raise it, but I should like tweet it kept as low as possible. I do not think you should charge all you canget. I should raise the rate very gradually up to the real value of the water.
- 180. Q. (Mr. Rajarata Mudaliar.)—Do you think that any economy could be offected by entrusting the work of measuring and assessing and collecting to one and the same staff?—I have not had enough detailed experience to say.
- 191. Q. Do you see any serious objection to such an arrangement. The cost of the collecting stoff comes to 5t annas per acre?—I don't think you could make any large reduction.
- 132. Q: (Mr. Allen)—Your records of rights of water would include the record of any rights that might exist as to using the pain on particular days?—That would be one thing; and the length of time a bund is allowed to stand sliculd also be recorded.
- 133. Q. If n water cess were imposed in the Saran District, would you exclude any lands which would not in ordinary years be benefited or those which would nover be benefited by irrigation through those causls ?—It would depend on the scheme. If any very large area was not benefited, I should exclude it.
- 136. Q: In this district, where there are schemes for krigating a strip on the north side, do you think unything like a water east can be imposed?—I would put it on the local area, something like the Draiange Act cess, except that I would leave out the provision in that Act under which you must got a majority of the people to agree. Let the Government lay it down; we shall get nothing done if payment is entirely optional. We are justified in compelling a tract of country to protect itself.
- 135. Q. You would have a compulsory lovy instead of an optional charge?—Yes.
- 136. Q. In preference to a water-rate?—Yes: The expense of such a scheme would be small compared with the expense of a scheme where you have a water-rate.
- 187. Q. Would you impose a water-rate for water netnally used as well as a cess?—I would make three stages—one where the scheme affected the whole district, one where it was carried over a very limited area, and one whore it was in the mature of a complete system like the Sone Canal

- system. In the second case I would charge a small case every year on the ground covered and also for the water. The water-rate would be the main thing, and I would liope gradually to drop the case.
- 138. Q. With regard to Mr. Oldham's proposals for special legislation for dispates about water, would that be something supplementary to the Crimtonl Procedure Code?—Yes; whether there be a breach of the peace imminute or not he should have power to ducide in eases of dispates or to take fiduciary possession of the works and to administer and maintain thom.
- 130. Q. Would'it not be difficult to word a law of that kind?—It would be difficult. It is in accordation with what I proposed for Eestern Bougal. The zamindars entirely accopted the priociple of that proposal. We have enormous churs there which they are always lighting over; they asked that the Collecter should also possession of any disputed chur and, if necessary, managerit until he had decided who was entitled to it. A chur is an island thrown up in the river and new allowal accretions.
- 140. Q. With regard to the two Leans Acts, the Beard's rules for the Land Improvements Leans Act do not nutherise the Collector to delegate his power for distribution of leans to a Sub-divisional Ollicer. Do you think that such a rule would be useful?—I do not think that there would be very much use in it. To us Rs. 200 is a large sum. At the same time there is no harm in the ease going to the Collector for approval; the delay is not so great as to he soriess.
- 141. Q. With regard to the Agricultural Lonas Act, the promble to the rules disconnages the grant of loans under that Act except to very needy cultivators. Is that a useful pressable? Is that the right spirit in which the loans should be given?—I am afraid it is not. These loans are not of much use except in actual searcity.
- 142. Q. (Mr. Muir-Mackenzie.)—Would you think it advisable to begin with a cess within the Triboni area?—No, it is not necessary.
- 143 Q. (Sir Thomas Higham)—Aboat your proposed oces I understand you propose that, in any district in which the demand is very irregular and where water is only required, perhaps once in four or five years, a cess shall be charged on all the area protected in addition to whatever charge may be made in the form of a water-rate?—Yes. If you have a complete causel system is which you can determine to what-place the water can go.
- 144. Q. That cess would be leviable only on that particular tract-that can be entered by the canal ?—Yes.
- 145: Q. You say you would levy direct from occupiers' along with the demands for water supplied in the same manner in which they take water, you would levy the water rate?—
  No, I would charge them for the water supplied, and they would pay their cess too. It would be fixed on a five years' calculation.
- 140. Q. The water-rate would be paid by the occupier ?-
- 147. Q. He would pay his water-rate if he took water, and a certain charge on the area protected?—Yes.
- 148. Q. (Alr. Muir Mackenzie.) Would be also pay thoses &- I would call it an insurance fee.
- 149. Q. Do you wish both to be paid by the occupier? ... Yes. In the case of a complete canal system.
- 150. Q. I understood the cose was to be paid by the ramindar?—Where you have a general cess, as I would in the Saran District, you will have to take it from the ramindar.
- 151. Q. (Mr. Allen.)—In the case of a complete canalistation would you collect your cess from every myst?—Yes, on the basis of the canal papers—simply a compulsory permanent lease.
- 152. Q. (Sir Thomas Migham.)—The cess to be so regulated as to give reasonable interest to cover the cost of maintenance. You would not call 4 per cent unreasonable interest?—I should like you to put it lower probably, but I should like to be told the scheme and the probable beaufit.
- 153. Q. Even when that domand is assured as on the Sone, there is very little prospect of tonching 4 per cent. I do not see how we can get it on a system where the demand is very irregular. But "reasonable" might be anything you like?—In Saran it was proposed to put a cess on the whole district like the present road cess and to have no water-rates at all and no charges for water. The general opinion is that it would be accepted.

Mr. L. Haro.

31 Oct. 03.

Mr. L. Hare.

31 Oct. 02.

- 154. Q. Would it be possible to pat on a cass like that as part of the embankment coss?—You would have to amend the Elobankmeat Act. You must legislate, because we have just mude a tweaty years' agreement for this embankment.
- 155. Q. The emhankment cess is payable by the zamiadars only?—Yes, a psicentogo on the land revenue. The road cess is a percentage on the rout receipts of the estate.
- 150. Q. If you made these canals and put on an irrigation as, would that be chargeable on the revenue or on the at he chargeable on the revenue or on the rental !- On the rental.
- 167. Q. That is to say, half would be recoverable from the landlord and half from the cultivator. For that you would require a special Act?-Yes.
- 158. Q. That would involve control by the District Board? -Not necessarily. You one put the control under an body you like; but I think that the Board might take it up. In any case the man on the epot must have ample power and not have to refer to anybody. The District Eugineer has great local knowledge and covers the greand.
- 159. Q. (The President.) We sheald be glad to know 169. Q. (The President.)—We should be glad to know if you have any saggestions you can give us?—I should strongly arge that too summent should supply as a man to each district, but principally in the northern districts, to make a first or preliminary examination into all possible schemes that may be put forward and to prepare detailed estimates for premising schemes. We could then say that such and each schemes are so beneficial that we should be justified in latint account of the present of the premising schemes. fied in legi-loting to secure the monoy to enable them to be carried out. I do not in the least expect that Government should incur ali the coet, but I think it must give help.

A STANSON OF THE REAL PROPERTY.

į

٠,

160. Q. (Mr. Muir-Mackenzie.)-Who would decide ss to the value of the schemes, the Collector or the Government f-The professional expert of the Government In many cases, where it would not be justifiable to levy a cess, the echomes might be held over to be taken up in a famine. In Bhabua there are many works of that surt that could be done, opening cuts into chaurs from the rivers to secare the water when floods come, etc.

## SEVENTH DAY.

## Purulia, 3rd November 1902.

WITNESS No. 52 .- ME. F. T. LYALL, Deputy Commissioner, Palemau.

- Mr. 1. Q. (The President.)—You are Depaty Commissioner F. T. Lyall. of Palamau, I understand?—Yes.
- 2 Q How long have you been there? I went there a the 11th of December and have lately been on three 3 Nov. 02. menthe leave.
  - 3. Q. Had you before been in Chota Nagpur !- No.
  - 4. Q. You have been about the district and know it well?—Yes, a good deal. I have spent about five or six months on toar.
  - Q. I believe the population is comparatively small?

    —Yes, and very scattered; 120 to the square mile.
  - 0. Q. You say in answer to question No. 4" the rainfall is so precarious in this district that almost all the mile so precared in this district that admost all the bhadoi rice crops being excepted. The normal neas of the winter rice crop is this district is 277,900 acres. Then typic per esat, of the rabi crops of the district requires artificial irrigation. ?—These replies were submitted before I retarned from leave; they are not obsolutely correct.
  - 7. Q. You say is answer to question No. 1 that the average gross orea annually eropped is 735,600 acres, and you go on to say is question No. 4 that "the normal area under rabi food crops is 181,500 acres." Rubi ie a lorge proportion ?-Yes, 25 per cent. is rabi.
  - 8. Q. (Sir Thomas Higham)—The crop that requires irrigation chiefly is the nee?—The irrigotion required for rabi is shelly for the germination of grain and wheat. I think irrigation for rabi is of less importance than irrigation for rice; when the rice crop has failed they are inclined to not down archi.
  - Q. tThe President.) Do they got a better return out of this rice?—Yes, very much; an average crop in rice would yield 75 per cont. more than a rabi crop.
  - 10 Q. And it would be got with less trouble? Yes, I think 70 per cent. of the rabi is not open to irrigation and most of the rice is irrigated.
  - 11. Q. In answer to question No. 5-A you say "eince 1896-97 the lovel of prices in the gram market has remained very near the condition amounting to scarcity." That is for the last five years ?-Yes.
  - 12. Q Have the people at the present moment just got-their heads above water?—They were extremely badly off lost year. Government spent a quarter of a lake on embookments and repairs of ahars; several zamindars have spent a good deal also. I have not required relief works, as there are sotherent jungle products, such as mahua, so that the people are not so dependent on coreals as they are elsewhere.

- 13. Q. Last year you had good rain?—Yes, but it was extremely late; there was an opportune fall of rain on the 20th of September which waved the situation, otherwise it would have been extremely precarious.
- 14. Q. In answer to question No. 8 year refer to reservoirs; I sappose these are very small?—Yes, they are very small. I don't think any reservoir would irrigate from its own water more than 50 to 100 bighas; in some cases where streams are diverted they irrigate more.
  - 15. Q. Is a reservoir and ahar the same thing?-Yes.
  - 16. Q. How much is a bigha?- f of an acre.
- 16. Q. How much is a bigha?—t of an acro.

  17. Q. In answer to question No. 9 yon say "a programme should be drawn up for each village or group of villages where irrigation work is needed through the agency of the Tahalldars in Government estates and of the proprietors in private estates." You don't contemplate any large irrigation works?—I should be very glad to see some of these eckemes which the Public Works Department have dealt with, curried out. I am inclined to doubt the criticisms made as to the poor financial prospects of the schemes. I think they would pay.

  18. Q. Mr. Maconalty, referring to the Nadars scheme.
- 18 Q. Mr. Maconchy, referring to the Nadaara scheme, same up his report as follows:—" The weak point of this scheme is the inadequacy of the source of supply, the calchment hasin being so small and so close to calchment has being so small and so close to the cemmanded area. There is almost a certainty of failare of supply in years when it is nost wanted, and the aumher of years in which the supply-would be both available and asseful is too small in allow of the scheme being looked on as a desirable one for Government to carry out. It would in any case be worked at a loss, which its lack aft real utility would not justify." Do you agree with that P—I don't think that criticism is just; 1873 and 1899 were the only years in which the reinfoll was not sufficient to make the scheme a success: and it is very soldem indeed that the extra water would not be useful.
- 19. Q. You think Mr. Maconchy takes too despondent a view of the scheme?—I think so; besides there are some difficulties in the way of his criticoloing the scheme; the chief is hie want of knowledge with regard to the system of tenure of land. In ordinary Bengal districts the only wey you can get n return is in the shape of a water cosa; in our district the land is entirely zamindari and subanced reats can be got; the zamindars, if they earry out a scheme, are entitled to got entire benefits from the rayats.
- 20. Q. (Mr. Muir-Mackenzie.)—Are they cash reats? Yes, in the majority of instances.
- 21. Q. (The President.)—Would you like to see the Nodaura retieme carried out at once or reserved as a famine rollef work ?—At once. We have estimates in the Civil Department is which the cost came to only Rs. 10,000. I

have worked out the figuree on that basis, and I think Government would be reimbursed for the onthry. I don't know on what basis this estimate of Rs. 77,000 of the Public Works Department is based.

22. Q. It mass be a bigger scheme than years, I foncy?
—Yes, there are four or five distributary chouncils, while ours had only two.

23. Q. The area commanded is only 5,375 acros?—Yes; it is impossible to get a large scheme in Pulamna.

÷

d

Mr. Horn.—These schemes were worked out in detail 25 years ago; there are plane and estimates in the Superintending Engineer's office. Mr. Maconchy brought them up to date.

24. Q. (The President.)—In your answer to question No. IO (a) you give the amounts of Government loans advanced during the past six years under the Lond Improvement Act. What are they generally takes for ?—Porely and simply for irrigation works.

25. Q. For making bunds, etc. !-- Yes, and for dams

26. Q. Could yan have spent more money if you had liked?—Yee, I think the zaminons were not aware that Government was prepared to make such large advances. In 1897 they wore very grateful for the money given and said it would be a source of great profit to them.

27. Q. In Bihar and elsewhere we have found no particular keenness about beans and a good deal of complaint about the circumfoentian; could it be made easier do you think?—I think it could be made distinctly easier in regulation districts; this is a harkward district and the conditions of Palumou are somewhat different. The mechinery requires a little oiling:

28. Q. The rate, I suppose, is 61 per cent.?-Yes.

29. Q. Does the rayat object to that part of it; would he like to have a reduction f.—No; he objects to the trouble of coming in to the Kochheri and to the enquiries that are usually made.

30. Q. Have you Sub-divisional Officers?-Ko.

31. Q. Is there anyone but yourself who can grant advances?—No; it is all done under my signature.

32. Q. You say in reply to question No. 10 (c), referring to the extension of private originion works—"their construction may be oncouraged by free advances or Government loans." Do you mean without interest at all P—Ac. What is meant is that they should be freely given.

33. Q. (Mr. Mair-Mackenzia.)—You don't mean grantsin-aid?—Ao; I think that would be fatal. The benefits are so very high. The improvements effected often yield as much as 75 per cent, interest in the shape of increased orition.

34. Q. (The President.)—You have a permanent settlement? - Yes.

35. Q. That is not usual in Chota Nagpur?—I am not aware. In my district it is the result of elemency of the Gavenament. Originally the entire district was the properly of the Polomul Raja; he gave out his land to jagirdam and collected rents in return for services on the estale; when the Raj was sold up far arrears of Government resource, all the jagirdam held the same position in respect of Government that they had held with the Raja. Government, instead of adhering to all the conditions and resuming the estates on failure of the male line, has given them permanent occupancy rights.

36. Q. You say in reply to question No. 11 (4), referring to wells, it is very desirable to stimulate their construction?—That will have very little effect on any famine question; it refers to vegetables.

37. Q. Not to rice?—No, nor wheat; it is only wanted for crops near villages—sugmenne and tobacco; sugarcane is very important.

38. Q. Have you as much money as you would like to give in takavi?—I think that Government is perfectly propared to be liberal in the matter and will give as mach as I would like; every year we are saked for an estimate of our requirements and the amount advanced depends on that.

39. Q. Is it worth while to stimulate it ? - Yes, certainly. There is nothing that will bound the district so greatly or do more towards warding off bad seasons and famine.

40. Q. In 1897-98 you had a respectable sum and it hose gone down to its. 3,000 this year?—Yes, that is because we have not tried to make the ramindars take the advances; in familie years we did try to do so.

41. Q. You hope to do so?—Yes, I want to. They are Mr. fully slive to the benefits of irrigation, but have not the F. T. Lyatl. capital to carry it out.

42 Q. What style of famine works have yea in this district?—They are chiefly irrigation bunds and 'chars'; many have been started and left, incomplete; their maintenance has been neglected; formerly in the Gavernment estates there were tikeders to whom the villege wee let out in ront; they often took leaus for the coastruction of ahars, and during their tenure they were allowed to make all the profite they could. Now we have taken the whole thing under our own management and there is no such inducement.

43. Q. Do you expect to stay here long?—One or two years.

41. Q. (Sir Thomas Higham.)—With regard to your answer to question No. 1, what is the area irrigated by Government works?—The figures given rolats to rice lands below ahars on Government calates; these ahars are not, however, Government works. The figures given are extremely incorrect.

45. Q. The area is said to be for the whole district?—ties. This also is incorrect.

46. Q You say in answer to question Na. 4 "the rainfall is so precarious in this district that almost all the winter crops are dependent on nufficial irrigation." What you mean is that it is desirable they should have it?—Yes.

47. Q But they don't have netificial irrigation provided aways ?—Not always I think the proper answer is that, as a matter of fact, somewhere about 80,000 to 90,000 acres are actually capable of being irrigated and that though rice hads are not absolutely dependent on it, they are better for irrigation and that the outturn would be improved by it.

48. Q. Yousay, if there is a failure of rain before the mudle of September, adars are not used P-No, I den't soy so.

49. Q. Is there ever a failure of rain before the middle of Syntember?—There have been only two years of failure that I am aware of in the lost 30 years?

50 Q. Would not the abure always be filled by the beginning of September ?-1 think prebably they would.

51. Q By the end of September irrigation would be exhausted?-Yes.

52 Q. And there would be nothing left for October? -No.

63. Q. You say revious should be get out of zamindars, land, supposing Government unde irrigation works?— I don't think, under existing circumstances, we could get mything out of it. We have several large landelders who are distinctly good ramindars and who are ready to take loans for brighting work if it could be managed. I think they should be oncouraged to do the thing themselves.

51. Q. If Government unde works that would irrigate zamiudars' land, would they make their own channels!—I think so and they would pay a contribution towards the cost of any pakka massary for a woir.

55. Q. On Government lands would you look for a return in increased ront ?—Yes; also in collection of roats.

56. Q In how many years ?—to the unjority of cases as soon as the water came; there are other lands on which there would not be a return sooner than from three to five years.

57. Q. Why so long ?-The land is very neeven and would require termeing.

58. Q. Rent is not fixed for a definite term ?-Wo have n acttlement for 15 years.

59. Q. Could you misse reat before that ?—The Beard of Revenue lines decided that we could not; I think we could. If we were in a position to say to a man "by the expenditure of Rs. 1,000 on any irrigation work we will double the outturn of your land, will you pay a higher rent or go on as you are now," I think they would gladly agree to pay the higher rent.

60 Q. You are in favour of the Nadaura and other schemes being carried out?—Yes, very much.

ol. Q. Don't you think they would fail in years when they were most wanted !—No. I don't think so; they might fail one year 1u 30, but in the menatime they would have done so much good in improving the position of the temantry, landlerly, and Government that we should all be in a better position to withstand famine; that one year would not hit us so bard.

Mr. 62. Q. They would have to be in all cases worked by F. T. Lyall, means of filling ahars?—Yes.

3 Nov. 02.

- 64. Q. Has there been any increase in the number of ahars in the last few years ?—Yes; before the 30 years sottlement there were in the Government entate only 190 and at the end of it 1,100.
- 65. Q. How long ngo was the settlement ?-It ended in 1896-97.
- 66. Q. Are they going on making ahars now ?-Yes; some were made in the famine of 1896-97 and some more in the famine of 1899-1900.
- 67. Q, Is that a regular part of your famine programmo?—It is the most important feeture in it.
- 68. Q. Havo you a programme of relief works now? -Yes.
- 69. Q. Had you relief worke lest year ?-No, in 1899-
- 70. Q. Is your programme complete now?—Yes, it is supposed to be. We have the names of villages where ahars are required and are to be repoired, but at the came time we have not got plene of the ahars that are to be made; as a rule, they are so small that plans and estimetes are not required.
- 71. Q. These ahars are to be made as relief works; are they in Government estates?—Mostly. Semetimes they are in private estates.
  - 72. Q. At the cost of Government?-Yes.
- 73. Q. If a man ceked for an akar, would you put reliaf labour there?—If it were absolutely required as a reliaf measure.
- 74. Q. Would be contribute anything !-No, not if it. were made in a famine year.
- 75. Q. You don't mind their heing made in that woy?

  —I don't think it is proper to make them in the villages of large zamindars who can afford to borrow the money to do the work themselves.
- 76. Q. How are eiter fixed; is anybody on the look-out for sites?—Yes, we have Tabeildars doing it. This is a matter I have taken up strongly; I have had a register prepared of existing ahars when repaired and the cost incurred; also of sites for new ahars.
  - 77. Q. On Government estateo ?-Yee.
- 78. Q. Not elsewhere?—No; we have to apply to the zamindars.
- 79. Q What proportion are Government estates of the whole?—One-tenth.
- 80. Q. (Afr. Muir-Mackenzie.) Have you any, difficulty in getting land out of zamindare for irrigetion works? — No, never.
- 81. Q. You don't pey anything for compensation?—No; possibly in one pergumeh we might have to; the circumstances there are different to the rest of the district.
- 82. Q. Woold you like to have a ourvey of the countrymade so as to fix good sites ?—For the lerger schemes it would be excellent, but not for the smaller ones.
- \$3. Q. It is quite easy to choose the sites?—Yes, they are very obvious indeed.
- §4. Q. Is this programme of yours based on the number of sites ulready fixed f—Yee.
- 85. Q. Who chooses the cites?—As n rule, it is the subordinate establishment, and during the cold weather I make it n point to look np these cites; I found in the past several had been very badly chosen and there has been n waste of money in consequence.
- 86. Q. If sites are not carefully designed, there is fear of whete?—Yes.
- 87. Q. Would it not be advisable to have a survey for sites P—I don't think it would repay you. The District Officer can go round end see tham.
  - 88. Q. Must the District Officer be the Collector ?- Yes.
- 80. Q. Could be, cover the whole district himself?-I think so; one cold weather is enough.
- 90. Q. From this paper issued by the Revenue Department it would appear that the demand for relief work is likely to be very small in your district?—Yes.
- 91. Q. Therefore you would not get very much in the course of the famine !—Very little.

- 92. Q. For real extensions of works you would have to rely on what?—Works undertaken by zamindars.
- 93. Q. Is there any room for more schemes for filling ahars from streams?—Yes, there is a good deal of room.
- 94. Q. Have you done anything of the kind?—I was met by nn nhsolute impasse from the Board of Revenue in the matter of the Nadaura scheme; they said nothing should he allowed during the enreency of the settlement nuless it would be shown to be locrative, while at the came time rents were not to be increased.
- 95. Q. There is absolutely in this district no chance of the people heing backward in taking water?—No, they howl for it.
- 96. Q. Will they pey for it?—Yes, in the shope of enhanced rent. They have often hogged me to moke ahars over their lands and take payment in the shape of enhanced rent.
- 97. Q. Is there any difficulty from the point of view of organization in making thess bunds as famine relief works?—Their being small and scattered, it is very difficult; it means en immense emount of lahour and expervision for the District Officer.
- 98. Q. Still it is not an insuperable difficulty?—No, you must have no energetic officer.
- 99. Q. There is no insuperable difficulty in getting establishment?—As e ruls, I should not have famine principles at all; let the work be done as piece-work.
- 100. Q. What is the principal feature of your tenure which enables a zeminder to get increased rent?—They are tenants-at-will. The Tocency Act is not in force.
- 101. Q. If a zamindar is able to got a substantial profit easily from the making of these, apparently, not very expensive improvements, how is it that he has not done so not ot be present?—He is a very beckword man, as a rule, and he has never heen taught very much. His expenses are heavy and he has not much epars capital at his command. The Nawa Government estate, which was under the Coart of Warde management, is an example of the benefits eccrning from irrigation. There was no enhancement of rate, although there was enhanced rent.
- 102. Q. Did they increase rent on account of improved classification?—Yes; 2nd cless became 1st. In 13 years the rent roll was increased from Rs. 12,861 to 18s. 26,170; the schedule of inter-was not altered.; the expenditure oairrigation was Rs. 11,557.
- 103. Q. That was done under the Court of Wards?—Yes.
- 104. Q. Since the Coort of Wards' time?—The further figures are not reliable, because they are gethered by native ageory. From the same estate we may, as an example, toke one work alone. The expenditure in the village of Nawa is put down at Rs. 1,000; the approximate area irrigated is 275 bighas; before the construction of the bund Rs. 1811 was got in the matter of rent, which has since heen forceased to ils. 250; in addition to that it is stated that from rise land which he cultivates for himself; they yield before was 450 maunds; now it is 3,500. It has increased in actual rent and outturn:

Ó

- 105. Q. Yon say under the Board's orders you were powerless because you could not enhance the rent doring the period of settlement. You said also that rayste would be willing to occept enhancement if improvements were made for their henceit. Don't you think Government should have the legal power to enhance if they improved the water-copply?—Yes, most certainly; I put very great stress on that.
- 106. Q. To come to the distribution of udvances. Do you think the Collector does not require any more help in distributing advances? Would you he inclined to have certain powers delegated to some subordinate officers?—Yes, I' think so. I would not go as far as to delegate powers to the Tahsildar. I would not go below a Snb-Deputy Collector on Rs. 120 to Re. 150.
- 107. Q. How far would you allow him to go? A couple of hundred rupees.
- 103. Q. What period would you allow for the repayment of these advances?—I think for the large schemes certainly 30. yeers; there are no schemes in my district except the Nadaura that would require each a long period. For most of the schemes 20 years would be quite ample; for enything helow Rs. 5,000 ten years would be enough. Another point is the delay in the repayment of the first instalment, I would give the herrower two to three years at least,

bocause he gets no return for the first year or two, especially in Palaman, because of the time it takes to get your new rice lands ander, cultivation owing to difficulties in levelling and so on.

- 109. Q. The prospects of getting water is sufficient to induce the tenants to undertake the labour f—In most cases it is not. The zamindars often do the terracing and lovelling and then let out land on quit rent.
- 110. Q. Would advances have to cover the expenses of lovelling as well as expenses of bunds?—I don't think it would be absolutely necessary. If they require it, I would not hesitate to let them have it.

202. - 4

Υ.

- 111. Q. You seem to have no apprehension that you would get as much money as you required for advances; how much could you got through in n year P—The people would require a good deal of education; just now I could got through Rs. 50,000 to Rs. 1,00,000.
- . 112. Q. Have you much trouble in the working of the existing small irrigation works like ahars?—Very little.
- 113. Q. Is there my trouble from people entting bunds? -Very little so for, but my experience is not large.
- 114. Q. Have you a record-of-rights?-In Govornment estates there is ; nowhere else.
  - 116. Q. Have youn record-of-rights in water ?-No.
- 116. Q. Do you think it would be possible to have it?'Yes, but I do not think it is a burning question now.
- 117. Q. In this district disputes about water don't go into the Civil Courts?—Not much. There is one ease in which Government has lost the entire right to the water in a stream owing to the adverse decision of the Civil Courts; that is 30 years' old, and it has affected us pre-judicially; if it had been appealable, I should have appealed, I am considering whether Government should endeavour to secure rights therein somehow or other.
- 11d. Q. Whose business is it to repair the ahare?—In Government estates it is the duty of the Deputy Commissioner and his staff.
- 119. Q. And ou zamindar's estato?—The zamindar does it himself; unless there is a tikadar, then be does it.
- 120. Q. It is not the tenant's duty?-No; the touant is supposed to do nothing more than fill up rat-holes, oto., and other minor damage.
- 121. Q. Is any record-of-rights going to be introduced in zamiodar's estates?-That is not under discussion at
  - 122. Q. There is no occasion in this district for any special legislation?—Very little. There is another point; the slopes in the district are so great that the water is never long in reaching a big stream and many people's rights are not concerned.
  - 123. Q. If you make ahars, you have no apprehension of difficulty in getting them kept in repair?—No; they will require some inspection.
  - 124. Q. And on zomlndars' estates?-I don't think Government can inspect there.
  - 125. Q. How will you make them do their duty !-- I think they should be given loaus to construct their own.
  - 126. Q. Once having made them, it is important that the repairs should be kept up?—I think the feeling of self-interest will suffice. It is only themselves who are harmed if there is neglect. It is difficult to see how anything more is to be done. If you give a man money and he repays it, what more can you do in the matter? If you made the abars by Government agency, it would be a different thing. different thing.
  - 127. Q. You would not make it n condition in giving an advance that the thing should be kept in repair ?—It would be difficult to enforce such a condition. If a breach occurred, you could not say if it was due to neglect or any-
  - 128. Q. You think there is nothing for it but to leave it to the self-interest of the man?—Nothing, especially in the ease of the bigger zamindars.
  - 129. Q. Could there be any large extension of wells in the vicinity of villages?—Yes.
  - 180. Q. If advances were given with liberality for wells, would they take them? - They require education; some would take them, but not many.
  - 191. Q. Is there anything like the same demand as for bunds?—Nothing like it; this is greatly due to the rocky nature of the sub-soil and well-sinking is very difficult there.
- 132. Q. Still you would be glad to have money, in your bands for the purpose ?—Yes, certainly.

- 183. Q. Do you think the transfer of officers has led to any discontinuity of pelicy in such matters?—Yos.
- 184. Q. It is important to kosp a man who is interested in such things ?-Very important, especially in non-regula. 3 Nov. 02. tion districts.
- 135. Q. (Mr. Rajaratna Mudaliar.)—You said the Beard of Revenno's objection to enhancement of ront during the nurroncy of the settlement prevented your ontrying out certain irrigation works; on what grounds did they raise the objection?—I cannot say. The letter reads as follows:—
  "The Board are of opinion that there should be no enhancements of rents during the present sattlement whether the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are willing to accept the rayats are the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the rayats are represented to the repr
- 136. Q. Do you issue a notification during the time of actilement P-Yas.
- 137. Q. Could you not get over the difficulty by inserting a saving clause to the effect that during the entrency of the sattlement if works are constructed by Government there should be onlanced rent?—Yes, the Board have simply to say that they agree to it.
- 13S. Q. You said in one estate the classification was raised?—Yes.
- 130. Q. I suppose zamindars could also effect such onhancements if they carry out improvements ?—Yes.
- 140. Q. Harother carried out any improvements . Yes, they are absolutely unfettered.
- 141. Q. I am referring to occupancy tenants?-There are none except in Government estates, and in Government estates occupancy tenants have no powers of alienation.
- 142. Q. In Government estates I suppose lands which are assersed at lat class rates cannot be enhanced ?—I would not cubance them during the curroncy of sottlement; I think that would be a breach of faith.
- 143. Q. Could you onhance 2ad class to 1st class?—I don't think there would be my objection.
- 144. Q. Supposing it is unirrigated?—If rice land is unirrigated, it is 3rd class and would not be classed as let class.
- 145. Q. (The President.)-And if rabi land ?-It might be classed 1st class thon.
- 146. Q. (Mr. Rajaratna Mudaliar.)-Since 97 you have granted Rs. 63,020 in leans for 279 reservoirs. Do you happen to know what area has been benefited by those works?—No, but a large area must have been
- 147. Q. That was done ohiefly the femine relief?—Rs. 30,000 of that.
- 148. Q. Is the condition of these works fairly satisfuc-tory?—I have not seen many. I have spent most of my time on the Government estates, but such as I have seen, seem fairly good and some very satisfactory.
- 149. Q Do may of these require to be completed?—Yes, to a certain extent. The distribution channels or pains are not all out, and sometimes there is a little earthwork requiring to be done. The majority are completed, though the benefit to be derived from them has not yet been fully obtained. That is to say, the new rice lands have not yet been mado.
- 150. Q. In answer to question No. 1 you give the annual gross area oropped as 758,600 aores. On page 79 of the Bengal Report on Protective Irrigation the area given against your district is over 900,000 aores—the average of three years apparently. In a statement furnished by the Bengal Board of Rovenue, giving the averages of five years, the area is only 598,100 aores?—It is difficult to explain this. The figures in my statement are those accepted by the Director of Land Records.
- 161. Q. (Mr. Allen.)—There is some mistuke. The figure for 1901 was 577,400. There has been an increase probably?—It is extremely difficult to give you a correct figure for the district, because only one-tenth has been netually surveyed. The tenth near outlivated for that oue-tenth has been put down at about 60,000. About 600,000 or 700,000 is the probable figure for the district. There is a statement here showing what menay we were able to advance on the faming year. There is no mason why as much advance on the famine year. There is no reason why as much should not be advanced every year. I have figures from various other zamindars showing the enormous benefits that accrued to them from irrigation. The eventual return is seldom less than 20 per cent, and usually between 40 and 100 per cent, un capital expenditure.
- 152. Q. (Mr. Muir-Mackenzie.)-Wo are not to regard the instance you have given us an exceptional ease?—No. You have another ease in our settlement reat rell. There has

F. T. Lyall.

heon nn increase from about Rs. 35,000 to obout Rs. 74,000

T. Lyall. in, I think, 30 years, and it is elaimed there has heen no increose of rates at all. The Settlement Officer said in his report that this is entirely due to the introduction of irrigation. More than half the oxisting pains at the time of his settlement of 1896-97 were in disrepoir, and it has been owing chiefly to that we have had sach onormous difficulty in collecting our rental. I have had a year's root in arreors. Now I hope this year to be able to get sufficient collections to make ap for post had years. heon nn increase from about R. 35,000 to obout Rs. 74,000

153. Q. (Mr. Rajaratna Mudaliar.)—The gross areo of the district was over three million neres. I suppose the difference between the occupied area, 600,000 to 700,000 nod the gross areo, is ell hill and uncoultivated?—Yes, and there are large forests.

154. Q (Mr. Muir-Mackenzie.) - There is a considerable amount of colturable waste? - A tremendous amount.

(Mr. Allen.)-Ahoot 600,000 acres coltumble waste. A great deal more in reality.

155. Q. (Mr. Rajaratna Mudaliar)—I soppose want of population?—In this ectote I have spoken of they (the Court of Wards) tried to run a scheme of immigration of imported lahour, but I do not think it really requires that.

156. Q. (Mr. Allen.)—You were Sah-divisional Officer in the Sewan District of Saran. Did you see the work dona by Mr. Tytler in extending well cultivation by making advances !—I saw n greet deal of it.

157. Q. What opinion did you form of the honefit resulting from the extension of wells?—It was very great indeed.

158. Q. Do you think more might be done by extending well oultivation independs atly of the Opium Department by meens of takavi leans?—Yes, but it is difficult to do, because you never heve the personal relation with your tecants that the Opium Officer has. The population is too large for a man to get into personal touch with. But there is a great deal to be dono.

159. Q. Which may be done by n special officer?—Yes. Or if you let it be known through the police.

160. Q. (Mr. Muir-Mackenzie.)—Through the police?
—I do not mean to say that the police should give them
money; simply to tell them through the chaokidars that
money is available if they will some to head-quorters.

161. Q. (The President.)—Mr. Tytler's was a spesial work?—Ho must have spent three or four handred rupees ont of his own pooket to help the royate with medicines. He had most extraordinory relations with them and his was very exceptional work done for Government. He had 80,000 tenants and pereonel relations with all of them.

162. Q. (Mr. Allen.) -10 you recommend the granting of takavi to rajste?—They won't take it in Polomeu. They are tenants-at-will and have no security of tenuro. They may make the improvement and be onsted from their lands. In Government estates some will take it, but even there they ore liable to have enhancement of rent.

163. Q. Do you think rayats ought to have enhancement of rent for improvements used by them or to have an immunity similar to that given under the Boagal Teaenoy Art?—It would he n good thing, but it would mean the taking away from the zamindars many of the rights that they have now in having these meu as tonootsat-will. They have not appreciably nbused them eo far.

164. Q But would it not be a good thing to prevent the zamindar subonoing the reat owing to increased profits of the rayats by improvements effected by themselves?—Tho position now is that the rayate are not making improve-

165. Q. If the rayots took takavi from Government now, would the first thing that the zamindare would do he to jump up their lands ?—I think so.

166. Q. (The President.) -At once?-If they were bad

167. Q. There is nothing to prevent them hy law?-Absolutely nothing. The only man who makes an improve-ment is the mon who gote the lense of a villoge; and the custom of the country is that if he chooses to make an improvement in the matter of alars or reservoirs, he is given half the cost by his landlord and is entitled during the onremoy of his lease to take all the profite he can get, and at the end of the lease the rillogs gees bock to the feudlord and he resettles it ogain, neually nt on enhancement of 25 or 50 per cent. Rentols nro increasing very very largely in the district.

168. Q. (Mr. Allen.)—You told Sir Thomas Higham that this 8,000 acree irrigated from Government works is

probably a mistake. Is it not the case that Government spends a considerable sum in constructing and maintaining ahars in the Government estate?—No. I do not think it has regalarly in the past. I enhmitted a long report to Gaverament on the subject.

Appending the state of the state and property and

Χ.

: }

ŧ

á

And Land

169. Q. Bot money has been given this year?—Yes; I got Rs. 25,000 from Government.

170. Q. Was that for construction or meintenance?—
Chiefly for repairs. There was a limit of about its. 4,000 for construction. A certain percentage of the rent roll is set aside for improvements. It is not nearly sufficient in a district like this. If Government wishes to make an estate like the Khes Mahala a paying concern, they must make a great doal more improvements.

171. Q. (Mr. Muir-Mackenzie.) - Was it ust the business of Government to moke these repairs without enhancement !-- Yes.

172. Q. (Mr. Allen.)—Your proposed to enhance lond during the currenny of the setiloment referred to large now echemes?—Original schemes; they need not be large.

173. Q. In a case like the Nadoora scheme, in addition to the actual increose of rent which the Government might obtain, would it not also gain something in the increased security of its collection?—Very mach.

174. Q. Whot is the porcentage of your collection now? -Mr. Escheroft has submitted roturns for three years, of which two wore very good years and one a bad year, and he showed that our collections were only 83 per cent. of the total demand. That is a very heavy arreor, and just now about a year's rent is in arrears.

175. Q. To what extent can that porcentage of collection be improved if Government spend more monoy?—In ordinery years, we ought, on a estilement like this only ordinery years, we ought, ou a estitement like this only lately finished—supposing our classifications be correct—to get a cent. per cent. collection. The Settlsment Officer recorded in 1897 in his roport that noless these repairs, for which I obtained a spesiol grant this year, are ondertaken, Government must look for arrears of reut.

176. Q. What is the conditions of the rayats in the Government estate, presperous or the reverse?—Very much the reverse. They have been impoverished to the lost

177. Q. Heve they been abandoo lng the estats ?—In considerable numbers. There is one outpost area which is reduced by very nearly 25 per cent.

178. Q (The President.)—Where do the people go to ?—Anywhere; into Ranchi or elsewhere. The competition for rayats is very great in the district.

179. Q. What is the abandoument of their holdings due to?—Many causes; to a great extent to this motter of irrigation; also to a very large extent to police oppression, the formation of forests and restriction of their rights of burning end grazing; and also to oppression on the part of the Government Tahsildars.

180. Q. (Mr. Allen.)—Is it partly due to the failere to maintain the abare?—Yes; we have hed most hitter comploints about it.

181. Q. (The President.)—How loog hes that gone on?
I think five yeors.

182. Q. Years of high prices and hord times ?—Yes. Previous officers have given returns of good crops, choriog that reats wers low and that the tenantry are well off. I count find it so. It is my personal opinion, and I heve toored a great deal and goue into it very oarfully.

183. Q. (Mr. Allen.)—You have Mr. Horn's note on the projects in Palsmao in which he soys "Mr. Maconchy states that the area commanded is 5,375 eeres, of which holf might require woter if made available." Is that a correct estimate?—No; that is very excessive.

184. Q. What do you has your opinion on ?—I andorstand that he means that the area within which water can be introduced is 5,875 acres. I do not think that half that area is under rico.

185. Q. It ought to read " the area commanded is 5,375 cres, of which a quarter might require water "?—Yes.

186. Q. Thet affects the etetistics right through as to the emonot of wotor required. There are no details given in these estimates os to the cost of eorthwork. Whet would you cousider the proper rate to pey for earthwork on these schomes?—In the Khas Mahals 650 onlie feet to the rupee. It works out at Rs. 1-9 the thoosand enbio feat.

187. Q. In Mr. Macouchy's note on the Peerce scheme he stetes that as Mr. Carter (?) makes no mention of alure

3 Nov. 02.

as in the previous scheme, there are prabably none. Is that carrect P--Na.

- 188. Q. Are there as many alters there as in the previous solution ?—In that matter it is one of the best aff parts of the district . the district.
- 169. Q. You gave us same statistics as to the increase of 189. Q. You gave us same statistics as to the increase of rents in the Nawa estate due to irrigation. Have you any more figures P—Yes. Thakarai Gubind Porshad Ningh, Zsmindar of Rauki, wrate to mand the Tasra echeme, an which he spent Ra. 7,000. Ha shows that before the construction of this work he had only 200 bighas of rice land. Naw he has gat 300 and he axpects in addition 250 bighas. The antiurn has been raised fram 10 maunds that higher to 25 manuals (kacheha maunds). -the bigha to 25 maunds (kachcha maunds).
- 190. Q. What is a kachcha mannd P—Elaven-tweetietb of the standard maund.
- 191. Q. Of rice, not paddy?—Of paddy. Kuar Leljivan Sinha was another saminder to wham we advanced money. He says "my paddy fields of village Tenrai yielded about 2,000 maunds of paddy, but I used to get no paddy in a failure of rainfall, so that the everage yearly produce did not amount to more than 600 or 700 maunds; but since I have constructed a bund at a cost of its. 3,000, I get 2,000 manuals avery year." It is important in this mattar to quate from Mr. Maconchy on rainfall. He says that one year out of every faur is a dry year. There must be irrigation to get anything above an 8-anna arop. The zamindar farther says "similarly in the case of Kudaga village I get 1,500 maunde of arops every year since I have constructed a bund at a cost of Rs. 6,000, though the average yearly praduce was not more than 600 to 700 maunds before." my lands of Nawadah village have been converted into paddy fields by the construction of a similar bund at a cost of Re. 2,500, and the average jearly produce has been increased from 200 to 600 maunds."
- 192. Q. In these estimates a provision is made for the acquisition of land. Would it be necessary to pay for land you might require for weirs or channels?—Nu.
- 193. Q. (Mr. Rajaraina Muduliar.) Nat necessary to pay campensation ?- Nu; they are all tenants-at-will.
- 194. Q. In Gavernment estates is there ant a sort of qualified occupancy right?—There we simply take the lend and give them mare valuable lend alsowhere. We do not have to pay in maney.
- 195. Q. (Mr. Allen.) In the softlement tables it says that third class rice land is equally rented with first class rabi. But it is twice as a rule; third class rice is double first class rabi! - In one or two perguanabs it is ea.
- 196. Q. That shaws the enormans value of rice as compared with rati in the dietrict. First alass land scens to be irrigated; second class nat always irrigated; and the third class depends on rainfall. I should like to meka it quito clear. The increase that Government might abtain wanld

be, firstly, from the rising of land from one class into a higher one; secondly, by the imposition of ront on newly F. T. Lyall. caltivated lands; and, thirdly, by the security of collection P-Yes.

197. Q. And, as regards onhancoment of rent, cen you give usany idea what that would averega over an area?— I could give figures for every village which was affected; that is, we have a list of all tha fields alassified at such and

198. Q. On what basis would you work out such an estimate? Would you assume that the laud at all the lawer alsesses was raised a alses?—No. We cauld not go quite an far as that. We should have to go on to the lands and see how much we thought would be affected.

- 199. Q. Hes any estimate like that been warked aut f-Yes, far the imperfact figures for the Nudnura scheme.
- 200. Q. What was the result !- The result of an increase in this Nadeum scheme of Rs. 1,000. It was estimated the scheme would only east Rs. 10,000.
- 201 Q. (Mr. Rajaraina Mudaliar.) Yau just said that 201 Q. (Mr. Rajaraina Mudaliar.)—Yau just said that the tenants in Govaroment estates were in an imporarished condition. Would not that be due in some measure to the rents having been raised from Re. 11,500 to 26,000 mr 27,000?—Tha figures you quate refor to the Nawa estato. The authencement of tents in the Cavernment estates affected their condition, but only in a measure. The rants were in many cases fair if the irrigation works were kept in repair. But in some pergunuals they have a system under which a village is divided into chares. A man was given a lump, and ha was tald "yaur tent is so much and yau can autivated. and ha was tald " your rent is so much and you can autive to as much as you like." But now we have introduced rent as much as you like." But now we have introduced rent far every acre of land braught under cultivotian. They object to that very strongly.
- 202 Q. The correct fallows are about 600,000 acres, with a comp area of 190,000; that is a large proportion. I suppose the tenents have to pay for such fallows? They used not to have to, but now they have to. Up to now they have avoided that by bringing new lands under cultivation. Now we have a system of keeping near records up to date, and we impose revenue on every piece of land under aultivation. I do not think we ought to. It only comes to 2 or 4 annas a for these bigha uplands. They are not supposed to relinquish a port of their holding. That also presses hard on them at times. The Deputy Collector has perfect direction in the matter, the content of the property collector has perfect direction in the matter, the content of the property collector has perfect discretion in the metter; be can recammend rebatement ta the Board.
- 203. Q. I find fram the Bengal Government memarandum that in this distrat provision is made for famina railef for 1.9 per cent. of the population of the area liable to be affected. Could you not find works for making a larger pravision?—These schemes that have been taken up by the Public Works Department are the auly large ones we have. We have a certain amount of large road warks un which we could also counter them. which we cauld also employ them.

# WITNESS No. 53 .- Mr. S. C. Sen, Vakil of Manbham.

- 1. Q. (The President.)—Do you passess property in Manbhum?—Yes.
- . 2. Q. Do you consider the whole of your district subject to occasional drought and famina?-Yes.
- 3. Q. Answering question 8 ynu divide ynur district into two parts, north and scuth of the Damada. Is that on account af the nature of the soils?—And also uf the presence of the collieries.
- 4. Q. So that, whon the scaroity was bad there, the people had amorthing clee to turn to P.—Na, in the matter of water-supply. The colliery waters should be stored in big reserrairs; at present the water goes off into the Damada a very large quantity.
- 5. Q. Would it fill a big canal?—I chould think so. Yuu will find a very large number of collieries in each villaga, eight ar tou, each pumping a large quantity of water, and for fifty villages the quantity of water wauld ha
- 6. Q. Wauld not the best plan be to utilise it after it had got into the Dumuda?—My suggestion was to utilise the water by sturing it up in big reservaire.
- 7. Q. If the Government made reservoirs or gave coma means of sopplying water, would the people take it every year? - Whonover necessary.
- 8. Q. But how uften would it he necessary? Once in three ar faar years?—For the last nine years it has been necessary avery year.

- 9. Q. And they would be willing to pay for it P-I do Mr. S. C. not know if Government would be outitled to get any cess. Sen. If Government undortakes to da work, it ought to pay for
- 10. Q. Nut charge for water ?-Nu. The Public Works cess was introduced to prevent famine.
- 11. Q. Are the people, with wham you are familiar, willing to take leans to carry out warks?—Yes; but the leans are not used far the proper purpases in most cases.
- 12. Q. In other parts of Indie we have found great advantage taken of the system of lanes for irrigation works?—The people in this part of the accentry are not so well educated and they are very needy.
- 18. Q. Are the bunds in villages generally kept in gaod repair ?-Na.
- 14. Q. Should any pressure be put un the zamindars or on the raunts to keep them in repair?—Yes, on the zomindar for these which are his praperty, and un the rayets for those excavated by them.
- 15. Q. You say that existing bunds could not be extend-oil without destroying the paddy lands adjoining them. But ahars could be despended f—Yes.
- 16. Q. And the bunds built up with the earth taken ut?—Yes. The reason is this—the ahar in this acuntry is out ?-Yes. made by patting in one or two bunds in which there are three ar two natural bunds, and immediately below tha new works the paddy lands grow up. These are irrigated by

Sen.

3 Nov. 03.

Sen. 3 Nov. 02.

Mr S. C. the re-colation of the water. But if you want to extend this band, you must naturally remove the embankments and destroy the land.

17. Q. Yau thiak bunds are preferable to wells ?-Yes.

- 18. Q. What is the objection to wells !- A well can irrigats a very small area, and a bund mada with the same amount of money would irrigate a larger area.
- Rajaratna · Mudaliar.) Bat build you would get un water if there is a failure of raio and a well has springs?—I have not seen a build running dry through a failure of rain. They are dry if the ahare are broken. Generally there is a large accumulation of water in a bund that is properly made.
- 20. Q. What area would be irrigated by a well?-About 10 bighas, 3 acres.
  - 21. Q. What would it cost?-At least Rs. 500.
- 22. Q. Regarding the misappropriation of loans; ampreso they are given in instalments after a portion of the work has been actually done !- it would be minimised.
- 23. Q. As regords the reduction in the reot recoverable from men who have constructed works, do you cancel it if the work is not kept in order?—No. The settlement is permanent after the band is made.
- 24. Q. Wauld it he a good plan to do so?—No, because he suffers equally if his land is not irrigated.
- 25. Q. You might enfaros this?—When such arrange-meat is made at the time, jalsassan settlemeat is made, yes.

WITNESS No. 54.—RAJA BHAGWAT DAYAL SINGH, Chainpar, Palamau.

Raja Bhaqwal Payal Singh. 3 Nov. 02. 1. Q. (The President.)—In which district are your lands situated?—In Palamau District in the Chota Nagpur Division.

2. Q. I suppose you have been long n resident in this district?—Yes, from several generations. This is the 18th generation that I have been in this district.

- 3. Q. And da you consider that irrigation is a very valuable thing in the district?—Certainly, irrigation is a very valuable thing. Our district is very hilly and rocky, ond without irrigation it cannot yield anything it all.
- 4. Q. You have a good deal of rainfall there?—For the last six or seven years we have had very bud rainfall. Since 1896 at 1897 our crop is always failing.
- 5. Q. Do yau think that if yau had good irrigation works in your district, that the people would take irrigation every year?—Yes, every year without fail. Our country is very dry, drier than Purulia, I think, and all the people are vary much in need of irrigation
- 6. Q Wauld they be willing to pay a water-rate?—Yes, quite willing.
- 7. Q. How much could they pay?—They can pay anything. Up to this time we have only erected bunds for irrigation purposes.
- 8. Q Do you know the Shahabad District where the Saae canals are?—I knaw it very well.
- 9. Q. Would they pay as much as the people pay there?—Yas, I think so; they would pay even mare than Shahabad, I think. They see that the Shahabad peaple are daing very well, and peaple thate, whose lands did not yield befare, have, since they have got the canal and irrigation, became very well-to-do.
- 10. Q I suppase that the kind of irrigation you have in your lands is all by pains and abars?—Oaly pains, and we use same small rivers far irrigation. We make bunds and get first af all a reservoir and from that we irrigoto our lands.
- 11. Q Do yau think anything mare than that is necessary? Do you think any larga works would be suitable in your district?—There are many big rivers like the Koel, Amurnath, Knadbar, Myla, Tulhir, which might be utilised, but they always get dry in the hot weather.
- 12. Q. Have you looked into the figures of this scheme nt all? Do you happen to know what the cost will be?—I have the experience of my own estate where I have been warking for the last 25 years, and I have got some experience with other big warks, just ns I have with small works.
- Just as I have with small works.

  13. Q. Are the peaple in your lands willing to take loss from the Gavernment to help them in irrigation?—All the ramindars of Palamau have taken loss from Gavernment and we have done lots of good wark. Of caurse there may have been same people who misappropriated the money, but lots of them have done very good work.
- 14. Q. Can they get loans quite easily?—Yes. Thay all get laass and all of the loans have been refunded to the Gavernment with interest.
- 15. Q. We don't often hear of big sums being given but by the Deputy Commissioner?—In the famino year lats af maney was given to the zamindars, and they all worked very well. Not a single pice was misappropriated by the zamindars.
- 16. Q. Do the people complain at all af the terms or of the interest they have to pay?—Thay feel this difficulty that if they fail to pay once, there are some rules that the whole thing will be taken at cace. Of this they are very much afraid.

- 17. Q. (Sir Thamas Highom.)—What rata of terest da they pay?—They are paying 6 per cent.
- 18. O. (The President.)—When do they repay it; after how loag?—They pay it back in five years; two or three instalments a year.
- 19. Q. Da you think that if, instead of five years, they were given 10 et 20 years, it would be better?—
  It would be very henchical to the zamindars and to the whale district, and also for the Government.
- what district, and also for the covorament.

  20. Q. They never give it for more than five years now?—No. All the zamindars and even the rayate wanld take leans very gladly; anly they are afraid that if they fail to pay on a fixed day, all the conditions will be impased and all the remaining maney will have to be paid back at once.
- 21. Q. Are there many wells in your district?—Yes. Our district is vary rocky, so we cannot irrigate properly. There are lats of wells.
- Our district is vary rocky, so we cannot irrigate properly. There are lats of wells.

  22. Q. Are the wells very expensive?—Natvery expensive, but still the people have not any money to spend on well irrigation. Sugoreane we always irrigate from wells. If we can get irrigation from reservoirs (bunds) and we have any good ones, we must irrigate from them.
- 23. Q. In these had years yan have told us of wore the wells dry, or did they hold water?—The wells were not dry; only the small reservoirs wera dry.
- 24. Q. Haw deap have you to dig before you get down to water in the wells?—In lots af places after eight at ten fect you find water.
- 25. Q. Would they last right through a time of drought?—Yes, but they can only irrighte a small quantity of laud.
- 26. Q. How much 10 bighas?—Not so much. By poins we can irrigate 200 or 500 bighas us the case may he. If we get a good hig reservoir, we can irrigate 500 bighas or even more from it.
- 27. Q. (Mr. Muir-Mackenzic.)—Have you yaurself taken money from Government?—Only Rs. 2 000. The other people were afraid to take lasas from Government, so I came forward and took Rs. 2,000.
- 28. Q. And you have spont this Rs. 2,000 in making improvements?—Yes.
- 29. Q. Haw much did yan spend in making acw pains altogether?—In six years I have spent more than Rs. 36,000.
- 30. Q. Has the result of that been to bring much more land under irrigation?—Yes.
- 31. Q. Can you say at all how many bighas you have brought under irrigation?—I think, sa far as I can remember, I am new aarning nearly Rs. 7,000, and hope to earn more whan I can turn the land inta paddy fields. I think, after spending Rs. 10,000 ar Rs. 15,000, I ahall make an income of nat less than Rs. 10,000 ar Rs. 20,000.
- 32. Q. You have already got an increase of Rs. 7,000 after spending about Rs. 36,000?—Yes. I shall oarn mare when I can turn the land into paddy fields. That takes a lot of time and expense.
- 33. Q. Haw long daes it take to turn the land into a puddy field?—You can turn it into a paddy field in one year, or if the land is high, it takes two or three ar five yaars.
- 31. Q. Has tha Rs. 36,000 you say yan hava expended include what yau spent an turning the land into paddy fields?—So far as I remember I only speat nearly Rs. 36,000 in six years.
- 35. Q. Haw much of that did you spend for ritins and how much for converting the land into fully fields?—I have spent nearly Rs. 4,000 or Rs. 5,000 in

į i

ŀ Ţ.

181

Ť

l: l:

turning the land into paddy fields, and the remainder on the bunds and channels. It have not prepared all my paddy fields as yet. The work is still going

36. Q. Wore these channels you speak of for taking the water from the pains into the fields?—From the pains and from the rivers both.

27. Q. What sort of outlet do you have from your bunds.—I make some pakka bunds and also some kachcha bunds.

38. Q. For that you put in what sort of outlet?—
I had to expend its. 10,000 in two years in making channels and making some palka bunds.

39. Q. How do you let the water out of your pakka bunds?—By cutting a channel undermeath it.

40. Q. You don't put a pipe under the bund?-No. requires a little experience to see whether the water will come to a place or not.

41. Q. If you could get an overseer's or engineer's help, would it be an advantage?—Yos. I have made a pulla bund and cut a channel. I expended Rs. 12,000 on the work. I again undertook the work last year. Of course I took the level of the river in my land and then I cut a channel and took the water out very easily and have irrigated the whole of my paddy land, and it is now in very good condition. Palaman is a very backward district and very hilly, and unless we irrigate it can yield nothing.

42 G. (Mr. Rejaratna Mudaliar.)—If you construct

42. Q. (Air. Rajaratna Mudaliar.)—If you construct bunds, do you enhance the rents.—Up to this time I have not enhanced the rents, but when the rayats get some benefit I may enhance them.

. 43. Q. So you have power to enhance. You find no difficulty!—They are quito willing to do this. My rayata especially are quite willing and ready to enhance their rents if I can improve their lands. There will be no hitch so far as I know. The rayats are very much in need of irrigation, because, if you get good irrigation, your crops will not fail, and for the last six or seven years there have been always failures and they have been getting nothing.

44, Q. Havo your rayats occupancy right?—In my zamindari there are no occupancy rights.

45. Q. Is there scope for constructing wells?—Yes. The poor rayats cannot construct wells at their own expense, but they used to excavate wells, especially the conhars.

46. Q. In such cases you don't enhance rents?—No. 47. Q. (Mr. Allen.)—You said you had got Rs. 7,000 profit. How did you got it?—By irrigation.

48. Q. How did you get it?—In my own cultivation. There are a few rayats there also. I think more than half is under my own entiration and about half

49. Q. What improvements in the yield of a bigha of ground do you think you can get from irrigation?—In good places, if the fields be manured properly, they would yield about 40 maunds kachcha per bigha.

50. Q. What is the yield from unirrigated land?—That is very uncertain. If the lands yield something, we get rent, and if they do not yield, then what can we get?—and if we do anything harshly, then the rayats wil go away. In our district for the last six or seven years we are all suffering from want of rain.

51. Q. (Sir Thomas Higham.)—When you have made an ahar it silts up after a time?—Yes, after a long time, probably after 10 or 12 years as the case may he. There are many kinds of ahars—big ahars and small ahars; the condition of all ahars cannot be the same? That is why I say 'as the case may be.'

62. Q. What do you do when they silt up?—Do you clear them out again?—Yes. It will be very beneficial and you can get more water into them than before.

53. Q. After how many years?-10 or 20 years as the case may ho.

61. Q. Do you clear out two or three feet of ealt?-

55. Q. Do the people clear the ahars themselves, or do you have to pay for it?—The rayats cannot pay; we do it ourselves. They are poor people and where can they get so much money?—They have always found difficulty in paying the rents during the last six or seven years of famine.

WITNESS No. 55 .- Mr. A. Cooke, Ten Planter, Ranchi.

1. Q (The President.)—I understand that you are a ten planter?—Yes.

2. Q. In Ranchi?-Yes.

3. Q. Have you been long in that country?-Nearly 19 years.

4. Q. Wore you here during the times of famino?—Yes, I was there in 1896 and 1899. There were two famines.

5. Q. Do the natives complain of the high prices there? The Deputy Commissioner told us the prices of food stuffs were very high?—They are gotting that

6. Q. You say no land is irrigated after the rains cease?—Yes.

7 Q. And you say "all the present cultivation depends on the rainfall, and the rayats seem to think that it is useless to raise water and that actual water from the clouds is required." Do not the pains irrigate long after the rainy season?—Very little after the rainy season; practically nothing. The whole district has lad no rain this last hathia.

8. C. It is an odd thing, is not it, that it is that water which is stored up that pulls them through?—No. It is owing to the failure of the rain that the water does not overflow and they never raise it.

9. Q. You say that irrigation is not wanted at all?— It is wanted to increase the area of the cultivated lande, but it does not protect against want of rain.

10. Q. You say "the whole country is undulating on the plateaus and thus offers an immense area to be improved by bunds, and I think that entire tracts of high and useless land might be watered from reservoirs on a higher level by means of pipes or aqueducts of any description which might be studied from Australian example." Do you know Australia?—No, but I have heard peeple who have come from Australia talking about it. I have had a man recently with me who has come from Australia and he is very strong on this point. The fields use about 10th of the rainfall; 13th flow away. If you make a channel and get it round one hill to another, the water could be led to places where it was not accessible before.

11. Q. You don't mean that water should be pumped 10. Q. You say "the whole country is undulating

11. Q. You don't mean that water should be pumped up into a resorvoir?—No, only the unrequired overflow.

Cooke, Tea Planter, Ranch.

12. Q. In reply to the question "Name the years in which reliable records show that there has been (1) famine and (2) severe scarcity not amounting to famine." You say "1896 and 1899," and you go on to say—"but I think that a large proportion of the crops could have been saved by raising water above the normal lovel of the outlots or by deepening the outlets, and thus irrigating some of the fields with the water stored in the reservoir." Was there not water in the reservoirs at the end of the rains that was not used?—Yes, the whole reservoir was full of water. There is a considerable lot of water which could be used if you could get it out by sluice gates, or pumping machinery of some sort.

13. Q. You mean it is below the level of the soil?—

13. Q. You mean it is bolow the levol of the soil?-Yes, far and away below.

14. Q. You say in reply to question No. 9—"What general measures should be adopted for extending irrigation in the district by Government or private works?"
"Ascertain the cost of bunds already established and the profits from them; this alone would attract capital into the district." You mean, I suppose, to publish them?—"Ves lish them?-Yes.

15. Q. You go on to say, "I know of one spot where a valley sends its water through a narrow gorge, and could thus be made to irrigate a large tract in the lower valley at little cost, and there are thousands of such places in the district." I would rather not have Sonapet mentioned.\*

16 Q. Has it over been examined by Engineers?—No, never. In all these gorges there are hundreds of places like that where you get valleys opening into

17. Q. Yon think, if you publish the results of works already established, you will attract capital into the country?—Yes. I believe in the country thoroughly myself.

18. Q. What is the Barkagarh estate you speak of in your memorandum. Is that a model farm?—No; I think it was taken over in the Mutiny. It is now a Government estate, worked by Government. It is about soven miles from Ranchi in a semi-circle.

19. Q. Then you say: "I recommend that trials should be made to put ammonia into water raised from reservoirs. This may be the reason why rain is necessary. Rain contains about one grain of ammonia to

Raia Bhaquat Dayal Singh,

3 Nov. 03.

Mr. A. Cooke.

3 Nov. 02.

Mr. A. Cooke. 3 Nov. 02. 144 cubic inches of woter; this would be supplied by a very small amount of artificial manure." Does the water that fulls into these reservoirs drop all its ammonio?—After rain stops the woter that continues to flow is droinage water and therefore partly filtered. The rayots tell me there is no use raising water. They saywater must come upar se. That is a more suggestion of mino.

- 20. Q. Then you go on to say: "the most valuable concession would be to advance money on easy terms." Has the rayat get ony difficulty in getting money in that way?—He cannot get money at all except through the mahajaa at big interest.
- 21 Q. The Deputy Commissioner advances money to the raynts; does he not?—We have started now. Ho has given me the cherge of a village bank with Rs. 300 to start with.
- 18. 300 to start with.

  20. Q. Besides that, the Deputy Commissioner has in his lands a certain amount of Government money to moke odvences to the district in general?—If you advance to one man, then there is always the difficulty to get it back on his own individual scenity. The new principle is to advance to the village as a whole. They advanced a lot of money to the rayats in 1897, and they are still trying to recover that money now.
- and they are still trying to recover that money how.

  23. Q. (Mr. Maur-Mockensie.)—About this statement that there is no land irrigated after the rain ceases, do you mean that if there is no uhor which is thied during the mousoon, and there is to break for some time, that no water can be got from the abor to irrigate the rice fields during the breakf—No. As soon as it is filled it overflows, and it stops overflowing as soon as the rain ceases.
- 24. Q. So that the only benefit of the rain is that rather more water is got than the rain gives which falls on the lands?—The benefit derived is that it extends the area of cultivation; you get in mare fiehls.
- 25. Q. I don't quite understand that?—For instance, if there is o small valley and n little embankacent across the hottom of it oud from that the water comes down both edges, then you get in nil the other sules of the slope. This one bund I am speaking of in Rampur will irrigate about 200 ocres of land eventually when the fields are level.
- 27. Q. Have you ever heard of any zamindars wha have received advances to make bunds having made considerable profits by itf-No.

In my evidence on 3rd November at Purulia I riated that the stored water, in the reservoirs formed by embankments, is not used by the rayats after the rains cease. On the next day I saw the Hazarinegh Local Board District Engineer. He told me that after the rains cease, the rayats raise the stored water and thus continue to irrigate their crops.

It is possible that there is more need for irrigation in Hararibugh than in Ranchi, but from observation in my neighbourhood and enquiries from the natives I am sure that the practice of throwing up water has not yet been adopted in the Ranchi District.

I wish to point out that, although my evidence in this matter may be doubted, as being controverted by the evidence of the Hararibach District Lingineer, it will prove on further enquiry to be true.

In Hazaribagh the rayats do raise the water. In Rouchi the rayats do not raise the water. I will suggest to the Deputy Commissioner of Hanchi that a few Hazaribagh rayats whall be engaged in the Harkagarh estate to show our people how it is denogand to prore to them the possibility of saving a part of the crop in bad syatoms.

Theirsteen of the property of cubicating and the

The increase of the most of cultivation and the eaving of a part of the crops when rain fells has very little bearing in the natter of preventing famine compared with the possibilities of enabling the rayats to heep that they get in years of plenty.

To put only one instance before you.

Rents ore due in October and January.

Rayats sell their rice to pay their rents.

In October 1902 in Ranchi the price of rice was 13 seers per rupce.

In December rice will sell for 16 seers per rupre. The rayate will pay their October kiets at the ratio of 13 seers and their Joonory kists at the ratio of 16

In the following August (1903) the price of rice will be 8 seers per rupes, but the mysts will have none left to sell, and in many cases will have sold their seed rice to pay their rents.

The rayots has sacrificed 18 seers of rice in October deposit is and 16 seers in January for every rupes of his rent. interest?

- 28. Q. We bad considerable evidence on the subject this morning from the Deputy Commissioner of Palamau. You were not here then?—No.
- 29. Q. The Raja of Chainpur also spoke of it. And Mr. Lyall told us of one estate in which they had advonced Rs. 11,000 for improvements and were enabled to double their rents. You have never heard of any instances of that kind?—No particular instances.
- 30. Q. You think if the zamindars will moke bunds they will get considerable profits?—Yes.

1

i

ζ

1

Ė.

4.

- 31. Q. You don't think there is anything unjust in their raising their rents?—No. They make woste lands into valuable lands. I have nover made bunds navelf.
- 32. Q. The village bank is an agency by which you advance money to the rayat end not to the zamindars?

  —Yes, to the rayet direct.
- 33. Q. Are not the royats of the district tenents-atwill?—I know nothing about their tenency.
- 31. Q. Is there not the danger of a rayot being ousted at the will of the zamındar?—I don't know that; still that does not affect the security of the bank.
- 35. Q. Has your bonk advanced any mosey for ogricultural improvements?—Rs. 300 once and Rs. 200.
- 36. Q. What sort of improvements?—The Rs. 300 was given without my conditions; that increly told us it was for cattle, but the other was advanced only for making fields and I saw they did so.
- 37. Q. You don't think the rate of interest at which money is given at present—one mans on the rupee—too heavy, do you?—No, I think it is right. But it is two annas on the rupee is it not?—The Government advance to us at one onna on the rupee, and we take two annas on the rupee. The surplus will repay the fund eventually.
- 39. Q. What does the mahajan charge?-That I don't knew. I really could not say anything about that
- 39. Q. Does the country about Ranchi differ very much in configuration from the country in Palanau?

   I have not seen Palanau. The whole of Ranchi is a plateau. It is all undulating ground.
- 40. Q. Are there a good number of streams?—Very few streams. There are only two rivers and some nullahs, which are only channels for the flood water.

If he could have borrowed the amount of his rent in each and put away his rice, he would be able in August to sell his rice at 8 seers per rupee, repay the loan and interior, and would have a balance of rice for his own use.

Ifo would have saved 5 seers per rupee in October and 6 seers per rupee in January.

This would surely have a better effect than any amount of irrigation.

The saving of money would imply more perfect irrigation.

It is money at low interest that is wanted and not more nater.

Below I give an instance which may illustrate the effect of advancing cash to the rayats and taking over their grain in trust.

Instance of a man who pays Rs. 54 renf.

Due in October		:_	:	:	:	:	•	21.	000	P
Advanced Interest of Required	D Ra.	54 @	G) pe	r ecn	ı	;·	:	34 3 37	088	
Without a loan be In October of In January (	13 g	CIS I			•	:	<i>;</i>	814 402	10E	10,
To keep this till !	lugu:	i mre	Då R	lous c	'To of 20 1	tal er co	ní.	763 :156		'. ;
To pay Rs. 37-6-1	@8:	icera	of ric		rape :			627 460	,	

This would either be kept for food and aswing or sold at 3 seers, and thus secure another its, 20-14-9 which is nearly enough to pay the following theober. List without borrowing.

Is it feasible to form grain banks, taking grain, as deposit in trust, and suivancing cash at moderate interest?

-, 1

3 Nov. 02.

# WITNESS No. 56 .- MR. WOODHAB CHANDRA ROY, Ronchi

# Replies to printed questions.

1. Q. (The President.)-You are from Ronchi?-

1

11

٥,

î Ġ.

S,

2. Q. Are you a zominder there?—Yes, I have some petty zaminderis there—e few villeges.

- petty zamindoris there—o few villoges.

  3. Q. Are you in Government employ too?—No. I am an Honorary Magistrate.

  4. Q. You soy here in reply to question No. 10—in Bunds are gonerally constructed by throwing ombankments aeross hill streems or lorgo drainage areas. The existiog bunds have been mostly constructed by zamindars and they how the entire control over in The state of repair is very miserable, because most of the zamindars are not well off and cannot offord to keep the bunds in proper repoir; and for this account they fail to supply needful quantity of water in the years of drought. The chief obstacle in the way of extension of bunds is the poverty of the zamindars, and so long as the existing law continues, the rayots have very little inducement to invest any money in embonkments even if they hove money and inclination to do it, as under the Chote Nagpur Load Law the rayats never acquire saleable or transferable rights to the land. I may add that, if this obstacle is removed, the rayats of themselves will take to constructing bunds and provide other means of irrigation in years of drought at their own cost. They will in that cose olways try to effect moterial improvements in whot may then be properly called their own lands. You say the zamindars are too poor to keen the bunds in order?—Yes.

  5. Q. Why don't they borrow money from the Gov-
  - 5. Q. Why don't they berrow measy from the Government?—Well, if a zamindor dies heirless, his estote goes free of encumbrance to the Chota Nagpur Mallornia, so that these zamindars, who see that they hove no successors, do not take any interest in their estates. It is a strong sort of law here.
  - 6. Q. But it would be profitable for the zamindar to hove his bund in good order, would it not? He would get more revenue out of it?—Yes, for the time being it would be profitable; but unless his estate is saleable or transferable, I think there is no inducement for him to do this kind of work.
  - 7. Q. Then the zamindar's property is not transferable here?—Not transferable, nor saleable, without the liability of resumption by the Maharaja on failure of male heirs.
  - 8. Q. Have you got any wells in Ranchi?-Yes, wo
  - 9. Q. Are they used for irrigotion?—In vegetable gardens. They also irrigate sugareone.
  - 10. Q. There is no cultivation of sugarcane in Ranchi?—In Bondoo there is sugorcane cultivation. There is a lorge embankment there called the Bondco bund. The bund belongs to me. I have stored a large quantity of water there, and more than four miles in length is sometimes irrigated in a year of drought. It is the very biggest bund in Chota Nngpur, I think Mr. B. C. Bose has dealt with it very largely.
  - 11. Q. How high is the bund?—It is not very high, about 10 or 12 feet high, but it is very long end wide.
  - 12. Q. Do the people wish for irrigation in Ranchi? Do they wish to have things better than they ere there?—To make irrigation work of Ronchi is very feasible and less costly.
  - 131 Q. You mean by making ahars? Ithink by dividing the spring of the hill streams you een make more cultivated lands and can cosily irrigate. I have got o rough sketch here (explains what should be done on mop). This is the hill and these ore all streams. The water fells in this way, but this pertion of the land has an indinction to fall this way.
  - 14. Q. When does that stream (indicates it) get dry?
    About the lat of November?—Sometimes before that.
    If we can raise bunds here (indicates it), we can get the water there all the year round.
  - 15. Q. Do you think the people would use water every year for irrigotion?—Yes, sometimes in years of drought.
    - 16. Q. Not every year? Every year it is not neces-
    - sary.

      17. Q. Would they pay fer the water?—Yes, for the Bundoe bund they do poy.

· ' - ..' ; ' '

- 18. Q. Supposing we make new irrigation works, would the people be willing to poy for them?—Yes. W. C. Roy.
- 19. Q. Would they pay as much as they do on the Seno canols?—I don't know the rate there.
- 20. Q. Rs. 24 or Rs. 2-8 an acre?—No; I think they will be willing to pay Rs. 1-8 percacro
- 21. Q. But they wish to have irrigation?—Yes. Large irrigation works are impracticable in Chota Nagpur, because of the country being unduloting and of the louds being scattored here and there; they are not in one place.
- 22. Q. (Sir Thomas Higham.)—You told us nothing about the way in which these ahars silt up. You say that most of them are in miserable repoir. What is the matter with them?—The silt is not elected.
- 23. Q. The silt has accumulated in thom so that they won't hold water?—Yes.
- 21. Q. What do you do for that?—The silt has to be removed.
- 25. Q. Is it worth while removing the silt?—Yes. The silt con be used as manure.
- 26. Q. How far do they carry it to use it as monure?

  These people only use o country cort and carry it a mile off.
- 27. Q. They have to pay men to take it oway?— Certninly not. I don't charge them anything for it.
- 28. Q. You let the men come and take it away?-
- 20. Q. You don't pay them anything for taking it away?—No.
- 30. Q. Why don't the rayats do that?-I have already said that the rayots have very little ottoch-ment to the land. They know that, by making im-provements they will not benefit at all.
- 31. Q. How long does an altor go before it wants cleaning out?—It should be cleaned every fifth year.
- 32. Q. Is there much stuff in it then?—Every year more than a foot of silt is deposited in it. The woter falls in a high current and brings up the earth from obove and deposits it there.
- 23. Q. After five years whot is the deposit?—It is not entirely filled with silt, because the silt is also taken away by the current thot passes over the ahar
  - 34. Q. Do the bunds ever burst?-Sometimes.
- 35. Q. When an ahar has silted up, so that it won't hold enough water, instead of digging it out, do they over raise a bund?—Sometimes. I do this and have done it. In 1897 I got some money from Government and cloored up the silt ond roised an ombankment.
- 36. Q. Is the practice of taking silt for monure largely followed?—I have been inducing them to do this and been trying to prove its volue. I have succeeded in proving it a nice manure and they have commenced using it.
- 37. Q. You don't pay them anything for taking it away?—No.
- 83. Q. (Mr. Muir-Mackenzie.)—This year you made one big bund yourself?—I purchased that bund in auction.
- 39. Q. Hove you made any improvements to it?~ Yes; in 1897 I made some improvements to it.
- 40. Q. How much did you spend on it?-I spent Rs. 1,000. I spont about Rs. 500 only to raiso ao embankmont.
  - 41. Q. Thot got more water into it?-Yes.
- 42. Q. Did it not result in nn increase of cultivation? Did you get more land under cultivation?-No.
  - 43. Q. You only got better water?-Yes.
- 44. Q. Were you able to increase your rents at all?—No. I won't be able to do that, because the rayats here their permonent occupancy rights.
- 45. Q. Have your rayats got an occupancy right?-Yos.

W. C. Roy. 3 Nov. 02.

- 46. Q. Are not most of the tenants in your district tonants-at-will?—The Maharaja's tenants don't get any occupancy rights—I mean salcable occupancy
- 47. Q. But your tonants do?—Yes, with my sanction which I generally give. In Chota Nagpur occupancy right is permanent, but not saleable or transferable. I was for some time a manager of Tori Pergunnah, and from that and from consulting all the rayuts I have learnt that it is only because they have not got the right of solling or transferring their property that makes them so indifferent.
- 48. Q. (Mr. Rajaratna Mudoliar.)—Cannot the tea-ants adopt on failure of heirs? Cannot a rayat adopt a male heir?—It is not always admissible. He-sides the rayats are so illitorate that they have no idea of this thing at all.
- 49. Q. Under the present custom or law are they prohibited from adopting in case of failure of heirs?

  —I dou't know much about it. I know that a Sub-Judge, Babu Amrita Lai Pal, hold in a case that adopting one are no good as the other sons, but the ease was not decided. It was compromised by the Maharaja. It was rather about to go against the Maharaja and so it was compromised.
- 50. Q. Is there a masonry sluies in your bund for letting out the water?—Yes. I made a dam and I keep that with trap closed and open it in time of need.
- 51. Q. The whole of the water is utilised for irrigation?—The whole amount was never required; half is quire sufficient.
- 52. Q. But you can pass it on?—It goes down four miles only, and irrigates the lands on oither side of it. The Bondoo is very fertile land.
- 53. Q What area is irrigated; how many bighasf-500 bighas.

- 54. Q. Your bigha is how many acres?—It is one-third of an nero.
- 55. Q. (The President.)—That is a kachcha bigha?—Three bighas make an acre.
- 58. Q. (Mr. Rajaratna Mudaliar.)—Is there as more land arailable for irrigation under your bund?
- 67. Q. (Mr. Allen.)—Do the rayats who hold land under the Bondoo bund pay higher reats?—They have got their fixed rent which is never increased.

3

1

120

- 53. Q. Why do you say the Mabaraja's tenants cannot got occupancy rights?—Occupancy rights they can get, but they cannot transfer it.
- 69. Q. (Mr. Muir-Mackenzie.)—You said you were manager of an estate?—I was manager of some of the Maharajn's brother's estates, the Majaraj Kumar's. estates.
- 60. Q. Were there any bunds there?—I commenced making several bunds, but there was some misunder-standing between me and the Maharaj Kumar, and so I had to give up his service before I could complete these leaves? thoso bunds.
- 61. Q. Did the work you did there result in bringing in any more lands under irrigation?—Yes.
- 62 Q. And did you get any botter routs from those lands?—I turned some fallow land into culturable land.
- 63. Q. Do you know at all how many bighast—I don't remember.
- 61. Q. You don't know how much the zamindar gained.—My rough idea is that I expeaded Rs. 500 or thereabouts, and the annual income was more than one hundred in the next year.
- 65. Q. From the new lands being brought under enlivation?-Xes.

## EIGHTH DAY.

WITNESS NO. 57 .- BABU GOTAL CHUNDRE SEN, Manager of the Palganj Estate in Hazaribagh District.

# Purulia, 4th November 1902.

Babu Gopal Chunder Sen.

3 Nov. 02.

- 1. Q. (The President.)- Is there much demand for irrigation in this part of the country?—Yea, throughout the country.
- 2. Q. How is that want best to be met? What ought the Government to do ?-Make ahars or bunds. There are a great many old ones and about 10 per cent. of them have been silted up.
- 3. Q. Do the ramindars or rayats make them for them-selves P.—They are very poor. The castom is that ramindars generally give away villages in tike for a five years' leave, and after the expiry of that period the mouza or village can be settled on anybudy slee. Un that account the tikadars do not care to make any improvements. In our estate we give tika for 20, 25 or 30 years, but even then the tikadars do not make improvements. Those who are not pour-only two or three estates-do not care for it.
- 4. Q. Could more poor men not get loss from Government to make their ahars?—They do not like the idea of taking losas. A certain percentage of them is taken by the amlas, and the rules for recovery are very strict.
- 5. Q. lu how many years is the sam to be paid hack?-Five.
- 6. Q. If it was twenty Instead of five, would they take loans !- Zamindars are always foad of taking leaus, but they do not always use them for the laprovement of their villages. They are not intelligent and not at all educated.
- 7. Q. Would they not get better reats?—If they make the bunds, then of course they are supposed to get better rents, but I do not think half the amount would be speat on making bunds if there is not some Government control over their action.
- 8. Q. There might he such control? Yes, the rayals would be very glad to have the bunds and the zamindars also. But I do not think the zamindars would be able to make alars without supervision and Government control.
- 9. Q. Why not? The old akars must have been made by themselvss?—Their forefathers.

- 10. Q. And they are not so good as their forefathere? -- No. They are deeply involved in debt and the estates have been divided up.
- 11. Q. Hare you any wells in Hazaribagh?-Yes.
- 12. Q. Are they used for irrigation ?-Only for certain crop--sagareune, potators and garden produce
- 13. Q. Rabi?-No, except in the thean of Gawan.
- 14 Q. 1 suppose the greater part of the coltivation is rice? Yes.
- 15. Q. You think all that is wanted is to put these ahars or bunds in order?—Yes, there will then be no failure of crops, and besides that, a lot of land will be
- 16. Q. If the people made these akars themselves, would they not do it ebeaper than the Gorernment !-- You
- 17. Q. Why should not the raya's with occupancy rights borrow from Gorernment?—because their land is not saleable. They are very poor and their holdings are not certain, because the zamladars and tikadars sasteb away the land from them at any moment; this tamindais would enhance their land. Those who have occupancy rights will continue to hold their land as long as they like, but the practice is that the zamindars take away the lands. The rayats are regarded more as tenants-at-will.
- 18. Q. (Sir Thomas Highars.)—What is the area of your estate?—207 square miles.
- 10. Q. Why do not you put the ahars in good order?-For want of money.
- 20. Q.—Can you not afford to do anything !-No, the estate is involved.
- 21. Q. (Mr. Muir-Mackenzie.)—You say, if these ahars are put ioto repair, there will be an failure of crops. But will they hold water in a failure year?—Yes, because in the Hazaribagh District. I have watched it for 35 yeers; the rainfall varies from 40 to 55 inea year, even in famine years, and it is only when the fall is not well distributed that there is failure of crops.

3 Nov. 02.

- 22. Q. If you have no good rain in Soptember ?-It will be no harm if we have ahars.
- 23. Q. Will the akars still hold water if there has been little or no rain in August ?-- Yes.
- 24. Q. Did you never make any improvement when you were manager of the encumbered exists?—As far as I could. The object of the Act is to pay off debt, and only what can be spared from the payment of debts we speed on improve-
  - 25. Q. Lid you make bunds ?- Yes.

And the first of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of

ď

:4

- 26. Q. Did you get more rent on that account?-Of -course we raised the rents and got new land nuder cultivation.
- 27. Q. Did you spend as much as a thousand rapees on one bund?—I spent about Rs. 1,000 in one year when the rental was Rs. 1.35,000.
- 28. Q. Did you over ask to be allowed to spend a little more money on improvements ?—Yes, and the Board was always ready to sunction that amount after the payment of debis.

- 29. Q. (Mr. Allen.) In how many years were the dobta Balu Gonal of an encumbered estate to be paid off P-Fifteen years. Chunder Formerly it was 25, but the Act was smeeded in 1884. Sen.
- 30. Q. You were in charge of all the estates administered under this Act in the Hazaribagh District ? Yes.
- 31. Q. What area was under your administration there? About 2,000 square miles. The area of the district is about 7,000.
- 32. Q. Would it be a good thing if more money were spent on in-provements in commbered estates !- Yes.
- 33. Q. Why ?-Because if, after the payment of debts, the estate is kept under management for some years to make these improvements, it would be most beneficial.
- 34. Q. Does the zamindar gain by making improvements !- Yes.
- 35. Q. In what way f-By increasing the rent and by reclaiming lands.
- 36. Q. For how many years did you administer these estates?—Five. From 1892 to 1896,
- 37. Q. What did you spend on an average in a year on improvements?—Very little; not more than Rs. 1,000.

WITKESS No. 53 .- Mr. A. H GARTZER, District Engineer of Hazaribagh.

- 1. Q. (The President.)—You have been 27 years District Engineer?—Yes.
- 2. Q. flave you ever seen severe famine there!—In 1873-74 there was famine there.
  - 3 Q. People dying from want ?-No.
- 4. Q Had you relief works on a large scale?—We constructed a road, 32 miles from Bagodar to Hazaribagh, with eight bridges and 82 culverts.
- 5. Q You have had no relief works since then?-No, not on such a large scale.
- 6. Q. Have you had anything to do with the irrigation of the place?—Yes, all the tievernment estate bunds and the encumbered estate bunds and those of the Court of Wards are nuder me.
- 7. Q. I suppose you see that they are in good repair?—As far as funds are available.
- S Q. Is there difficulty in getting money?-Yes, caproisily in encumbered estates. At the must we get Rs. 1,00) a year. There was only one create under the Court of Wards (Dhanwar estate) and we made several improvements in that.
- 9. Q. What is your experience of bunds in zomindari land?—They are in very bad repair; most of them silted and breached. To my certain knowledge extending over 33 years. I did not see that any work has been done in these bunds by zamludars.
- 10. Q. Do you put that down to the poverty or the stupidity of the zamindars f.—The poverty of many. The larger zamindars do nothing. In some parts the rayats would gladly pay enhanced rents, because they are so bodly off for water.
- 11. Q. What should be done? All the chare should be cleaned out.
- 12. Q How much silt lies in them?-In one place I have seen ten feet, and other places, fire, six and seven in the basin of the bund.
- 13. Q. Is the silt any use?—They never toneh it; it is mostly sand—the weshings from the upper lands. They should have a little dyke to keep the soil from washing into them.
- 14. Q. Would it be necessary to put up bunds in other places?—First those in existence should be repaired.
- 15. Q. Would not that be enurmously expensive?-Not more than Rs. 150 to Rs. 300 cuch.
- 16. Q. Why do not people take advances from Government !- They are willing to take advances, but they do not know how to manage their affairs. If they took advances and the thing was managed under Government control or that of the District Board, the bunds could be made. They would pay an interest of even two pice in the rupes per annum and pay book in five years.
- 17. Q. Does the Deputy Collector refuse to grant them the monoy P-Most refuse to take, because they do not got the full smuunt of the monoy advanced. Some get about 12 annas in the rupes. It stops in the hands of the mohneries. If these advances were made through Deputy Collectors personally, they would get the whole amount.

- 18. Q. They do not want more than five years?—No. Mr. A. H. The last time they had to pay within two years, I believe. Gantzer.
- 10. Q If the Deputy Collector went out with a bag of rupers and enquired, would a good number take advances from him?—Yes, if he went in time. The last time they went out rather late when the ased had been sown. But the work in their (proph's) hands would not be done properly. The District Board can help in that as in 1897. We had their help in measuring up the works.
- 20. Q. In 1807 there was distress here, but not famine ? -Yra-
- 21. Q. You say the failure of crops in Hazeribagh is by no means the result of scanty rainfull, but due to untimely and irregular rainfull? Yes. They find difficulty just before resping—the hathin period.
- 22. Q. If they had these abars, they would have water? -Yr,
- 23. Q. You ery "a bund once allted or brouched is seldoin or never reprired, breause the rayat looks to his landdoin or never reported, bleass the rayat looks to his land-owner for the necessary repairs, but the landlord in most cases is hopelessly involved in debt." And the landlords ought to be compelled to keep them in repair?—Tes. Because they do not know their interest. If a little water case were imposed on them, it would be better; say, a pice in the runces. They would be very glad if they had water, because it would help them, whereas the road ceas they do not care about. But they take a personal interest in this not ear about. But they take a porsonal interest in this
- 24 Q. With this water cers would the District Board carry out the works ? Yos. Without supervision it is a waste of monor. The work actually done should be measured in every case.
- 25. Q. You say "loans under the Lands Improvement 25. Q. You say "loans under the Lands improvement Lones Art are not taken freely by the people for the extension of irrigation, or reservoirs, owing to the difficulty experienced by cultivators, in obtaining them," and you mention the approxime measures usually adopted in redising them. Yes. You suggest for the encouragement of these leans (1) "the partial remission of advances." What is that—not to take the whole back?—Last time they remission of opening when they did the allowed thom a remission of one-third when they did the
- 26 Q. And (2) "total remission in had years." You do not mean morely postponement and (3) "the extension of the periods of repsyment" ?—"Two years was very short. They want five years.
- 27. Q. Lastir "grauls-in-aid?"—and if advances were given to the rayate clubbed together, a dozen respectable men of each village, they would be more easily realised, because outh would be held responsible.
- 28 Q. (Sir Thomas Migham.)—You were in this district in 1897 and 1899?—Yes.
- 29. Q. Did they have much famine in 1897?-In only one corner of Geomean thans.
- 30. Q. The rainfall was not short !- No, but not properly distributed.
- 31. Q. You did not do any village works?-No, except repairing akars in Government, encumbered and Court of

Gantzer. 3 Nov. 02.

Mr. A. H Wards estates. They like that work better than roads, Gantzer, becaese the soil of the latter is very hard.

32. Q. How many people did they have on read works? Not more than 2,100 a day.

83. Q. You had famine in 1899?-No.

34. Q. Short rainfall?-Yes. But we bad hardly any relief works.

, 35. Q. What were they?—Mostly abars in the Government, enembered and Court of Wards estates.

· 86. Q. You never put relief labour on zamiudari estates?
—In 1869 we got R. 1,000 from the Roja of Padma and I re-excavated nine of his ohars.

87. Q. The labour comes from the ramindari estates for the rollef works. When a tank is ones silted up, us one will ever clean it again. Is it worth while?—Yes, they would hold a lot of water.

38. Q. How much water do you want to flood on asrc of lond with three inches of water ?—About 11,000 cabio feet. Then there is the earthwork to clear.

39. Q. How mach would it cost you to clear that earthwork ?—We calculate R-. 2 a thousand.

40. Q To clear enough silt to bring out one flush for on aero you would have to spend Rs. 22?—Not more than Rs. 15 an acre to remove silt 3" deep.

41. Q. That is a great deal to pay for every sere. I quite understand they don't care to harrow money to clear their tanks it it costs as much as that ?—If they got money at 2 pice in the rupee, it would not cost so much. They would gladly pay that.

42. Q. People nover take the silt out for the purpose of monuring their fields?—No, but you can improve the bank with it.

43. Q. Did you clear out a lot of those chars in 1899? - Not many. We get from the Court of Wards Rt. 5,000 and from the ensumbered cetates Rs. 1,000 and from Gorernment estates Rs. 1,600 or Re. 2,000.

44. Q. (Mr. Muir-Mackenzie.)—Did you use all that money in clearing out silt?—In deepening the basius.

45. Q. You did not use it is raising the embankments? In re-sectioning them and raising them in some places, where hero were breaches.

46. Q. You did not increase the height?-No. They could not afford to de that.

47. Q. Would not that have been an effective way of getting more water into the ahars?—The ahors would hold more water by despening the basins.

48. Q If you have a failure of rain in Sentember and 48. Q It you have a minare or rain in semember and Outober, will yoar ohars held any water in October when all the water has been taken out far the September waterings?—They hardly water in September. All they require is to water in October during the hathia period.

49. Q. Not oven if the rains fail?-No.

to. Q. Therefore, if you have good rois in August, you will have plenty of water in the abore in October?—Yes. If for fifteen days they get water at the beginning of the second week in October, the crops will not fail.

51. Q. On the Government estates you made some ohars. Has not more rent resolted from that? -- Until a re-settlement is made they are not going to take any more

52. Q. No new lands brought under coltivation?—Not yet, but at the next rettlement. It is now let to tikedars and they will not take new lands nor uline the rayets to do it. All the estates are new being re-rettled on the rayet wari system.

53. Q. (Mr. Allen.)—When you apoke of the repayments of taken loans within five years, were you speaking of the repayment by instalments or the entire loan?—The entire loan by five justalments.

54. Q. You think it would be a good thing if the period for repayment of the entire loan were postpoued for 20 years?—Certainly.

55. Q. (The President.)—With all your experience of this country have you ever seen any places where you thought a very large reservoir might be made?—I do not think that would do, because the land is so undulating.

56. Q. A point about 80 or 100 feet high?-No, if all the little abars are maintained, there will be plenty of water.

WITNESS No. 59.-Ma. F. A. SLACKE, Officiating Commissioner of Chota Nagpur.

Mr. F. A. Slocks. 3 Nov. 02

No. 192 M R , dated Ranchi, the 5th May 1902. From-F. A. Slaces, Esq., t.c.s., Offg. Commissioner of the Chota Nagpar Division,

To-The Secretory to the Government of Bengal, Irrigo-tion Department.

I hove the honour to reply as follows to Government order No. 1457-I., dated the 10th of December last, for-narding a set of questions framed by the Iudion Irrigation Commission regarding the administration of water-supply.

The following officers were called on by my predeces-sor, Mr. Forbes, to submit replies to the questions framed by the Commission, viz.:—

The Deputy Commissioner of Singblum;
District Engineer of Ranchi;
of Palamau; of Manbhum, and

32 of Hazaribagh.

3. Ou going through the file, I found that the District Engineer of Raushi had expressed his inability to give any information on personal knowledge, and that in the case of Manbhum, the District Engineer being absent on leave, the replies had been enhmitted by the Overseer in charge.

4. I therefore eatled on the Manager, Ensumbered Estate, Ranchi, for replies to the questions, as repards that district, and the District Engineer of Manhhum having returned, I desired him to moke such notes us he thought fit on the unswers given by his locum tenens.

5. Their replies having been received, I now submit, in original, the onswers given by-

(i) The Deputy Commissioner of Singhbom;
(ii) The District Engineer of Palamau;
(iii) The District Engineer of Hazaribagh;
(iv) The Officiating District Engineer of Manbhum,
with District Engineer's comments thereon;

(v) The Manager, Encambered Estato, Ranchi, nod would request that when these are printed, five apare copies of cach may be esut me.

6. The eafety of the crops in this division in years of sconty or irregular minfall depends on the sinto of the ahars, of which the unmber is at present much below what it might be. How to increase the number of ahars and to maintain them in efficient repair are rether difficult questions.

The following matters are involved :-

(i) Natore of tenancy;

(ii) Provision of capital;

(iii) Liebility to increese of rent;

(iv) Provision of the land required; and

(r) System of maintenance.

7. With regard to the nature of the tenancy, the existiog doubts will, in the course of the next few years, be removed, as the survey and record-of-rights is completed.

Removed, as the servey one resord-of-rights is completed.

8. As to capital, the subject admits of amb-division necording as the nid is required by (o) tecants or (b) zemindars. So long as the tecouts have to come into the head station for the money required, and the present system of using peons for realising the arrears is mointained, the repngnance to have recourse to Government for aid will not be lessened.

I would make it the ordinary rule that advances should be given out lossly by an officer not below the grade of a Sub-Deputy Colle tor, and I would employ u similar officer to effect the realisations bimself. The expense, looked at merely as a loan busicess, would be high. But such expenditure is trifling compored with what is speed often for no real lasting good to a district in famine times, for the prevention of which these akars would be of much assistance; rection of which these chars would be of much assistance; and with regard to the ramindars, the bulk of them in this division are speadthrifts. The few who can monage their estates will always, like the ramindar of Contari, in Palauan, be keenly alive to the pecrainry advantages derivable from nuch works, and will need neither aid nor outside pressure. The others neither have the means nor the inclination to undertake such schemes, and they are not. propared to borrow the requisite funds from Government, as they are aware that the results, owing to went of any effective enpervision, would probably be grossly incommen surate with the sums expended.

I am, therefore, of opinion that any real increase in the number of the alars must be looked from the tenantry.

9. In all probability there will be many cases in which a tenant, desiroes of making an ahar, cannot do so, os some land accessary for the scheme is not in his possession.

It will, therefore, be very necessary to devise isome easy method for meeting a difficulty of this kind, otherwise the salami, which will undoubtedly be demanded, may often -prove prohibitive.

10. The two questions about the hobility to increase of reat and the system of maintenance seem to me to hang together. It is plain that the tenant must always have an incentive to induce him to keep the bund, which forms the chare, in order, and to periodeally remove the silt from the ahare. The landlords could not maintain these ahars themselves in order. They would not afford the necessary staff nor would they cope with what can only be described as the wantou thoughtlessness of the villagers who will often, for the calculations at few falls are the calculations of the silter a reminder hand. for the cake of entebing a fow fish, out a zamindari bund across the middle and repair it badly. The result is that next season or so the bund burnts.

For this end, I would suggest that after the expiry of the period for which the land improved may be held subject to no additional rent (by way of compensation for the cest incurred in putting up the bund), the tenant may be called on to pay an increased rent: the new rental, however, not to oxered what the rental of the land would be not the rates next but one below those prevailing for lands of the same quality in the village.

In this way, if the improved lands were first-class in quality, the tenant could werer be called on to pay more than second-class rates for them, and the difference would compensate him for the cost of repairs and induce him not to let the bund get out of repair. I would allow this privilege to a tenant who was not the successor in interest of the maker of the aker, otherwise it would foll into disrepair like so many of such works already have.

11. There rectains, however, another class of works which would be very useful, viz., bunds across streams whereby water is directed by a pain to a series of ahars. In seasons of searty rainfall, these are most neeful, but their number, I understand, is not many. Owing to the want of any general power of combination amongst the tenantry, works of this nature are beyond their means, and but few zamindars are wise enough to undertake such schemes.

Ordinarily speaking, about 45 of these districts are being managed by Government, either as kine mahals or nader the Wards Act or the Encumbered Estotes Act. I thirk myself that more might be done by Government in such estates than has hitherto been the case to introduce seek searces of supply, and I am about to address the Board of Revenue on the subject.

No. 810-R., dated the 5th January 1902.

From-W. B. Thouson, Esq., I.c.s., Deputy Commissioner of Singbhum,

To-The Commissioner of the Chota Nagpur Division.

With reference to your No. 749M.R., of the 14th December 1901, I have the honour to submit the following replies to the enclosed questions set by the Irrigation Committee:—

## A .- GENERAL.

1. The whole of Singhbham, of which I have been Depety Commissioner since 2nd April 1898-

3. (1) No.

(2) No. (3) No. Mr. F. A. Slacke.

3 Nov. 02.

(4) No.

(5) No.

- . (6) Yes; from lack of capital for initial expenditure.

  The district consists of three large estates. The owners of two of these, Porabot and Dhalbhum, are unenterprising. The third is the Government Kolhon Estate for impravement in which Government allots ubout Rs. 10,000 annually are forbital than the state of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the c nually, out of which about one-third to one-half is annually spent in making bunds for irriga-tion. The raysts are improvident and poor cultivators, and consequently have neither fands nor any strong desire to make improvements in irrigotion themselves.

  - (8) No.
  - (9) Yes; from the undulating configuration of the country, bunds and tanks are the only practicable form of irrigation.
- 4. No such assessment is made at all during the curreacy of the tenants' settlement. On its expiration, the land irrigated is assessed according to its class. The same applies to enhancement of rents of rayats who have extended intention which have a tendent. irrigation (which here is done only by the construction of Lunds) at their own co-t.

I consider this is sufficiently liberal.

- 5. No. Because the people are both bad cultivotors and lacking in caterprise.
  - (1) No.
  - (2) No.
  - (3) No.
  - (4) No. Advances should not be made for works of doubtful utility.
  - (b) Yes.
  - (6) Yes.
- G. No. Except among the rayats of the Kollian Government Estate, in which Government annually makes a number of bunds. This desire is, however, an expression of a wish to have a good thing the well-being of these them nothing. They would not keep the bunds in proper repair after Government P. A. SLACKY, -25-2-1903.

B .- CANALS OF CONTINUOUS PLOW.

There are none such.

C .- CANALS OF INTERMITTENT FLOW.

None such.

## D.-TANKS.

Under this head I include also bunds.

- 28. (1) These are constructed so as to catch the rainfall draining off a considerable area of high lands. In some cases they also contoin springs, but the drainage forms the chiof source of supply.
- (2) In tanks cout is made in the embaakment when water is wanted. In bunds overflow enttings are mode at the ends of the embankment through which surplus rainfall escapes, and is distributed over the area to be irrigated. Should the rainfall fail, the embankment itself is out. In this case the area irrigated is comparatively small.
  - (3) (a) From beginning to end of raine.
- (b) and (c) In these cases the tank or bund acts an economiser of the rainfall. It collects the surplus rain on the occasion of each fall of rain, and permits it to be utilised between the different showers.
  - (4) About 150 to 200 ocros.
- 24. (1) The rayats are too bad oultivators to avail themselves to any great extent of bunds and tanks for this purpose. They are, however, beginning to do so by growing wheat, tisi, and some other crops on laads from which they have already taken a paddy crop.

(2) Practically oot at all, except where the irrigation permits upland enombsoked lands growing rabi and other suab crops to be turned rice-producing embanked lands. Mr. F. A. Slacko.

3 Nov. 02.

A STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STA

**K** 1.

TO THE REAL PROPERTY OF THE PARTY  (3) In the lowest lands a full or osarly full crop may be obtained; in the bigher irrigated lands a part of the normal orap may be obtained. Bunds in this case are not a complete protection against failure.
- ploto protection ogniost failure.

  25. (1) The bunds and tunks are not fall enough to saffold means of irrigation until after the first few showers. Shauld these he insufficient to fill the tasks and bunds before they are needed far irrigation, the value of the tooks need bunds for irrigation its very little. Shauld they fill the tasks and bunds, the value of the latter for irrigation is not affected.

  (2) Very cansiderably. Water is most reeded when the paddy is farming in the year. If the rainfall cease before or of this time, the bunds do not hold safficiant water to affect full protection to the area irrigated by them.

28. No.

- 27. (1) (n) In Ladi, or high embaoked hads, ane-third.
  - (b) In bera, or low embanked lands, one-fifth.
  - (2) (n) Io bidi, double.
  - (b) In bera, one-half.

- (2) & (3) Nil during the currency of a settlement. On the expiration of the settlement, the land is assessed according to its closs, which may have been raised by the irrigation provided.
- 29. Uoually unthing.
- 30. By the persons inderested. Leaving possible breaches in the embankonents out of account, this is practically negligeable quentity.
- 31. By amicable agreement.

No.

32. Yes; however, I consider the manate of this district to be too improvident to admit af encouragement being successful

33. No.; no; ao; by re-excevoting the trak.

### E.-Wells.

Wells are oot constructed for irrigation.

### II

Answers to questions in enclosure to Chota Nagppr Commissioner's No. 749 M.R., dated the 14th December 1901.

1.—The suswers below refer to the Paloman district, where I have been over eight rears District Engracer, and was associated with immuno relief aperation on two occasions daring the period.

S.—The initial rainfull recards ura kept in the Deputy Gtreass as speeds Commissioner's effice, which can F. A. SLACKE.—70-1-1902. best give the information.

3. (1) to (9). -The district is very sparsely populated. The present supply of cattle seems collicion only for present codes.

I have not seen any but ordinary cattle manoro osed, and that to a limited axtent only.

The sail is generally poor, and black cottan is not very

With most of the smaller loodlards linek of copital for initial expenditure appears to be the chief obstacle to extension of irrigation.

In the cause of caquiries by Mr. Carter, the recepte con-sulted were willing to pay calmaged rent or revenue if water far irrigation could be casared.

6.—Doring the had seasons of 1896-97 and 1899-1900 the majority of laan petitions filed were for earthwork in connection with bunds, points, ahars, dams, otc.; a few only for drinking weter wells.

(1) In (6).—It has always accord to me that much may be done to guard against failure of crops by a judicious system of least at the smaller landholders, and official guidance and export supervision to expending them.

I heard an complaints about the rate of interest or the period of repayment, Simplification of the procedure on

that the poorer land-oweers may reedily obtoic loone appears to be all that is necessary.

There is n strong dreire on the part of the people to provide the means of irrigation which they instinctively believe to he the only means of ouving their crops in a had year, ood giving better crops in an ordinary year.

### B .- Canale of continuous flow.

None in the district the physical feetures of which would not admit of such encode helog made economically on my extensive goals.

### C .- CLUALS OF INTERMITTENT PLOW.

None in the district. There are easly a few limited oreas which are mutorally farourchle for this class af irriguico works; hot no such project has yet been carried out anywhere in the district. The possibility of this class of work in a few selected and apparently promising areas was inquired jute, and reported an, by Mr. Carter to the Saperintending Eaglocee (on special duty), Irrigution Eaguiries,

### D.-TANKS.

There is no organised ayalem of tank irrigation is the district, and therefore nothing in formion data for moswering the questions under this head.

23. The method commanly osed to the district is irrigation from adars or small reservoirs af water formed by cartleen bunds thrown across eatohment lasins with a view to intercept the untural surface drainage. There are also more protections reservoirs of water formed by domining up nains and small nadis, but their onmber is camparatively very small.

In the case of small abars the water is led to the fields immediately below by a plip drain ar as open cut is the Lunds. From larger reservoirs poins or claumels are cut to lead the water to fields more or less distant.

The supply of water is entirely dopendent on the rainfall. Timely fall of rain being essential to paddy cultivation, the water in these reservoirs is held in reserve, to be used only when rale lyrigation is fitful or fails altogother to Septem-

Abars or reservoirs commonly made are small, and protect n few bighas lo n few teas of bighas only.

24. Very aften in a year of reanty or nalimely rain three adars make all the difference between a foir crop and no crop at all. In a year of ample raiofall they are generally of little use; that is, in years in which the rainfall is evenly distributed in July, August. September, and Oolober.

26. Not ordinarily, hat of crilical periods when the nuprity in the adars has been exhausted, shallow wells ore dug as a last resource to save standing crops.

Not in the Government estate and in may other clairs. Then they are the property of the incident of the institution them.

F. A. SLACTS,-26 4-1003.

30. Ordinarily such reservoirs require little in the way of repair. Their utility and efficiency as a means of irrigation are necessarily conficed to omail and detached areas anly. This indigenous system appears to be the only ane which is suited to the means of the people and the physical characteristics of the district. Whether it is capable of being improved, largely exleaded, encouraged and guidel by efficial agency so no to give a fair amount of immosity from and seasons, is, perhaps, a question which is worthy of careful consideration.

## E.-WELLS.

Bå. There is an arganisef system of well irrigation in the district to enable the statistics required by the questions to be farmished. Shallow and temporary wells are used in especially favourable tracts which offer facilities for sinking them at a trifling cost. Systematic irrigation fram permanent wells is not practicable, nor would it be profitable over the greeter portion af the district—

(I) Io Hussainahad and Chatterpur thanas, adjoining the Gva district, personnal wells are usually 30 to 40 feet deep; io the other thanas, 40 to 50 feet deep.

(2) In shallow wells, from percolation generally; in deep wells, from springs and pe colation. In a year of drought the spring level af water good down condiderably lower than noval to the bot

(3) The cost varies considerably, depending chiefly on whether rock has to be pierced through or not, from Rs. 250 in ordinary soil appears to Rs. 2,000, which was the cost of the well, 52 feet deep, 12 feet internal diameter, sunk 30 feet through rock, in the Daltongsoj jeil.

(5) The water is raised from chollow wells by the usual weighted lever; from deep wells, a skin bag, rope and pullay, and cattle power are used.

35. (2) Iu Hussalnabod thana, on the lands immediately adjoining the Kool river, poppy is irrigated almost wholly from shallow wells 10 to 15 feet in dayth. Poppy neltivation would probably be impracticable without such irriga-

Use. 28. (1) The selection of site for a permacent well in a district like Polaman is necessarily a difficult task, inasmach as the presence or absence of rock in the sub-soil makes a considerable difference in the cost.

(2) There is no numeral difficulty in actual construction.
Wells, as u means of irritotion, are not populor, and hence
no such advice or assistance has been sought.

no such actics or assatzance has been conjunt.

39. No. Judged by financial results, well irrigotion would be unprofitable, even it were everywhere practicable.

40. Yes, but only on isolated places where they can busual by the cultivators thomselves of the cost of a few doys' baloor.

They are not of much protection against drought, but they have their uses. In lands otherwise unprotected against a endden temporary failure of rain—natural irriga-tion,—the loss of crops may be staved off by their means for a time.

ATTL CHANDRA BASERIBE, District Engineer, Polamon.

DALTONGANI;

The 30th December 1901.

### C. M. O.'s HEAD CLERK-

Will you please give the overage minfall of each month of the year over your elganture (see question 2 within merked in red penell)?

Please return by noon to-morrow.

A. C. BANERJEE,

District Engineer.

The 1st January 1902.

Besides Daltongaoj thero aro nino other min registeriog, stutions in the district. The rahnfoll records for these stations are not avoilable in this office. They are, I believe, kept to the Deputy Commissioner's office. Into, therefore, mable to furnish the average rainful for the district. Bat I give below the amount of rain registered at station Daltongauj during coch mouth of the year 1901:—

PALAMAU ;

The 2nd January 1902.

III.

Mr. F. A. Slacke 3 Nov. 03.

No. 183, dated Hazaribogh, January 1902.

From -A. H. Gastzer, Esq., District Engineer, Hazaribagh,

The Commissioner of the Chota Nagpar Division.

With reference to man letter No. 749 M. R., doted 14th ultima, I have the benomer to submit replies to some of the questions from personal knowledge. The numbers below refer to the questions:—

### A .- GENERAL.

1. The coswers refer to the Hazaribagh district. My knowledge is derived from an experience extending over 26 years as District Engineer of Hazaribagh.

2. The average rainfall in each menth of the year is as follows, taking the average of the lost five years:—

Month,						Bainfall in inches.
January		,				1.80
Fobruary						1.31
March						0.60
April						0.71
May						2:02
Jane						9.50
July						10.01
Aogest					٠	11.30
· September				٠		9.05
October						2.60
November.						0.05
December				•		0.24
			T	otai		50.35

8. There are obstocles in the extension of Irrigation orking from (1) spersity of popolation; (2) insufficient supply of eattle suited to the cultivation of Irrigated land; (3) insufficient tempty, and frequently on its ten late connecement and carly cessetion; (6) fack of capital for the initial expenditure and of funds for the more expensive onlithation of irrigated crops; (3) uncertainty of tenure, and (9) lost, though not least, the cursed five years thiere system in vegue. (4) The coil is out unsuitable nor (7) is the fear of enhenced rud on obstacles to the extension of irrigation in this district.

A Age as I an agreement

thie district.

A. As far as I am aware, no coboncement of assessment or account of Irrigation has yet been made, beeness very little, or hardly anything worth mentioning, hos been expended by the zamindare on irrigation works for the last 80 years to my certain knowledge. No cubancement of rent is mode whou tenants extend irrigation to their holdings at their own cost. I woold seggest that the principal zamindars of this district be compelled to improve their ahars or reservoirs, as 90 per cent. of them are practically useless, being silted up out brached.

As the seguetty is multipling, it is gave your be apartured.

As the country is undulating, it is very casy to caustruct ahara bunds or reservoirs to impound weter during the raise. An ordinary new reservoir, or askers bund, does not cot more than from 18. 400 to 500; such recroirs ore most areful to cultivators in this district, where excels

These ahara bunds, or reservoirs for storing water, have proved most useful for irrigation purposes in this district, and the mukararidars or myats who have constructed them feel no difficulty whatever in soltivoling their loads in dno time. In the Hearthogh district the evenge rainfall is about 50'35 inches in each year, and even if it were less, it would be quite enough to fill nur ahara bunds or reservoirs.

reservoirs.

The failure of crops in this district is by no means the resolt of scenty rainfoll, bot is due to untimely and irregular minfall. It will be seen from Mr. Forbee has tagnisque minfall. It will be seen from Mr. Forbee that quinque and report that the roinfoll in the first part of the year 1890 was much more than was required, whilst in August and Exptender the rainfoll was neusually scanty, resulting in the wholesale foliate of crops, whilst in 1807-98, though the minfall was below the normal, it was very favourably distributed, consequently there was a good crop.

If water coold be stored, even in small reservoirs, old over the ecuatry, above a dokur, or rice lands, sufficient

Mr. F. A. irrigate it from time to time, i.e., occasionolly, till the end Slacke.

3 Nov. 02. of erops—in this district, even if there was no rainfall during the kothia, the critical period for sice irrigation.

during the hothic, the critical poried for rice irrigation.

In this district there still crief in number of large and small abara bunds, or reservoirs, constructed long ago; and olthough they are not protected by concrete walls, ottone pocking on inner clopes, or by rubble pitching ontode, they nor still intact, though silted up and practicelly useless; and all that is needed is to remove the silt, and to line the escapes with gookks rubble moscory to make them useful. An akara bund ones silted or breached is seldom or ocvor repaired in this district. The rosson of this is that the rayst looks to be landsholder for the necessary repairs, but the landsholdsr, in most cases, is hopelessly involved in debt to spare snything for the banch of his rayst. raynt.

In my humble opicion legislative measures may be adopted to compel the londholders to repair (by instalments) the existing ahara bunds on to construct usw ones, where necessary, by odvancing them money on rates of interest lower than what can be allowed under the Land Improvement Loans Act.

In the creat of their failing to comply with the request of Government in this respect, Government may be empowered to do the work for them, and to recover the cost of the exme from them at low rates of interest.

5. Leans under the Land luprovement Leans Act are not freely taken by people for the extension of irrigotion recoveries, owing to the difficulty experienced by enlitvators in obtaining them, not to mention the oppression mecanes usually odopted in realising them. These leans on a very unpopular. For the oneonregement of these leans, I would suggest the following measures:— (1) partlel remission of advances;
(2) total remission in bad years;
(3) Extension of the period of repayments, and
(4) grants-in-nid.

6. There has been no opportunity to find out this.

The outlivators in the district are most moxious to get new ahara bunds, or reservoirs, constructed, and old ones repaired and elegaed of allt; but they have no fonds to do the work, nor will the principal zamindars assist them in tiding over their difficulty.

Above all, I would onggest the establishment of agricultural banko.

All advances should be made (locally) by responsible officers, not below the rack of a Deputy Collector, after personal enquiry, not depending on any amilah or ministerial officer.

## B .- CANALS OF CONTINUOUS PLOW.

None in the district, nor is the undulating and hilly nature of the country onited for cannis.

C .- CANALS OF INXENDITIENT PLOW.

The same remark as obove.

## D.-TANES.

Tanks are nover used for irrigation purposee in this district.

Their place is simply enpplied by ahara bunds, or

E.-WELLS.

Wells are never need for irrigation purposes in this district, except challow, temporary wells for poppy cultivation.

N. G. Busserve.

N. G. Bibrerse, District Engineer. The 18th March 1902,

### A .- GENERAL.

1. The netwers given below refer to the Mansham district and are based upon general observations made in the ordi-nary course of my dottes when trarelling in the interior of the district.

2. A chatement of the average rainfall in each month is nonaxed. This has been compiled by taking the average actual rainfall in each month for the ten years ending in December 1901, as obtained from the register meintained in the Deputy Commissioner's office.

In the Deputy Commissioner's office.

S. There is no regular system of irrigation resorted to in the district. This copes chiefly depend upon the rainfall. The only form of ifrigation is from bunds. The sorface of the country is very undulated. These bunds are generally constructed by throwing earthdykes cores declirities or natural drains or raviners on high lovel for heading up the drainage, thus forming a cost of a recervoir with the natural radges or high lands on three sides and the dyke on this foorth. In yours of country minfall in the sowing season, this water is run out through outs or drains norose the dyke for propering the soil for the sowing or tronsplantation of crops. Similar means are adopted for protection the stemal groups from withering up. This refers to the winter pathly crops only, which is the which crop in the district. Water from the bunds is olso lifted and haled out for tringating enall patches of Jands for the rabi crops. The ntility of such bunds altogether depends upon the size and site of the bund, their capasity and the rabid of the bund, their capasity and the rabid of the vill import that the several onb-questical control of the such and the control of the such and the control of the such and the control of the such as the capasity and the rabid will import that the several onb-questical control of the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such as the such

From the above it will appear that the several enb-questions under question 8 cannot be definitely answered. The following, however, may be noted:—

(2) The general condition of the cottle is very poor.

(3) Yes.

(4) No, so far as I nin awore of.

(5) Yes.

(6) Yes.

(7) No.

(8) The tenancy law is not in force in this district; uncertainty of tenurs is, however, no obstacle in this district, excepting in cases of waste lands brought nuder cultivation without regular selfement of the terms of the tenure.

(9) None that I know of.

4 Land which is irrigated—rather brought under enlitera-tion from works constructed by prirate epital—is googra-ly exempted from assessment for five years, after which the land is assessed of corroot morket rates and n concession of six nunus to the rupes is mode in perpetuity to this

occupier.

Tensots, as a rule, seldom extend irrigation to their lands unless the essessments are fixed permanently, purily for want of means and parily for want of encouragement from their laudlords. For encouraging irrigation oren in the form in which it exists in the district, tecanis shoold, it blink, he protected against undue accessment by the landierd. Aly imperfect knowledge of existing provision of the law preront my otoling whether they are liberal; but I am of opioion that the transfer only the get at least an equal share of benefit derived from irrigotion works constructed of this expense. ot his expense.

5. I am under the impression that leans under the Land b. I am under the imprevious tast some under the Lina Improvement Lossa Act are not freely token. This is chiefly doe to an absence of enterprising spirit amongst the nortenthural community generally, and partly to the difficulties experienced both in obtaining and repaying the loans. The general imprevious is that the majority of applicants from roull tracts seldom receive the full smeant they apply for, and have often to pay more than whot may ey apply for, and have often to pay more than whot may doo from them—

(1) The rate of interest should not be more than 6 per cent, per annum, but need not be less than 4 per cent.

(2) I would not recommend remission of interest, excepting in special cases, to be determined by the Deputy Commissioner, as this is entre to have a demoralising effect, and to likely to lead to diversion of funds thus obtained to objects other than the purpose for which the lonn may be advanced.

(3) Same us (2).

A septiment C None in M 23. [3] +

I bave taken the official year, as it corresponds very nearly with the agricultural year.

I bave taken the official year, as it corresponds very nearly with the agricultural year.

3. No regular system of irrigation cotalus in this district. The only works of irrigation are the bunds or reservoits of water, constructed by making embaukments an solar or naimal drains and hill-streams. The bunds get their supply mainly from flow of water during the rainy season from the adjoining hills and high lands, and come to the nee of entitystors in years of seasty or irregular rainfull. They also benefit the lands below by percelation. Water from the bunds is brought into the fields through points or water passages which are constructed on both ends of the embankment. Sometimes the water is taken out by outting the entounkment, the cut here gafterwards filled up. In this district bunds and wells are, I think, the only suitable forus of Irrigation causis will be disproportionately easily, especially as there is excreely any river in the district which contains copions water in all seasons to enable the construction of Irrigation causis will be disproportionately easily, especially as there is excreely any river in the district which contains copions water in all seasons to enable the causis to draw their sapply of water from it. There ore bunds in some villages, but several of them have got eithed ap, and are of no no on present. It will be a good thing if each village gets at least one bund in a suitable place. Some of the villages are hig nod comprise of several bandes. These hambes are practically generate villages, and should each have a bund. The cultivating people of this country ore generally poar, and no cohancement of rent shool be looked for from construction of bunds. Bot their construction by hundrals will increase their income by bringing now lands under cultivatina and by turning uplands into rice-field. It will his innow punctual payment of rent by the raynes in answer to the sub-questions separately, I beg to so bunit that there are sparsity of popularition in some treats solid in all there are s

There is fear of enhanced rent, and there should be a law

There is fear of enhanced rent, and there should be a law to the effect that when the rayat constincts bunds and wells at his own cost, the localized should not be allowed any enhancement on that concount for a pretty long period, any 16 years. The uncertainty remand faiting male helps in the puttra poutradile jeairs in the male line of the puttra poutradile jeairs in the final grante.

Off. Committees.

Off. Committees.

Off. Committees.

tion to the jegirdars of the Maharuja. But this does not tion to the jogirdars of the Mahanja. But this does not affect improvements being made by occuponcy raynts or rayats helding korlar or khanikari lands. There is one obstacle which stands as a har to improvements being occented in this district by rayaty. It is this, that the rayots owning raynti lands cannot construct kunds or dig wells, except with the permission of the landlord. I think that those should be nlaw to the effect that every occupancy rayat will have the right to construct n kund or dig o well on tho land he holds without having to obtain the permission of the landlord.

will have the right to construct named or dig o well on the landlord.

4. Lands nowly brought mader coltration by the construction of bunds or otherwise by privote capital are exempted, according to established custom, and not oscally under written documenta, from payment of rent generally for three years and, in exceptional cases, for opwards of that period annill the lands are actionly brought nader cultivation. When the period of exemption capires, the lands are aresisted in loof line rate of reat prevailing on the village for ordinary Raja's lands, excepting pargua Silli where the assessment is made at 13 or 1, port of the provailing rate of reot, and in pargunas Biru, Bareva, Timar, Hondo, Rahey, and Barenda, where the rayats are not inflowed the privilege of paring rent for newly-made lands in reduced tale. I would recommend that the privilege be extended to the rayats in all parts of the district. The newly-made lands allowed to be held at n reduced rate of rent ore called anga-abound in parguna Sills and korkor elevidere. If nay rayat constructs, with the permission of his landiard, a bund for the improvement of the lands which he already holds, he has not to pay any enhanced reot, but has to pay rent at korkar rate for nplands which are convarted into rice-fields. But cares to which rayats concirned bunds for the improvement of the lands they already holds are very rice, principally because the rayals me paor and gonerally live from hend to nooth, or seen worse, as a considerable number of them often have to borrow money at high rates of interest for porthose of seed or plengle calife. The greeter portion of the hondord, and the surpless which remains is not always sufficient for the year's emenumption. This is why emigration is so general.

5. Loons under the Land Improvement Loone Act me not taken freely by the people for the construction of fundire—the unity form of irrigation obtaining in the district. As they fear thank Government money, I woold met recummend only extension of irrigation of elited

6. The extension of irrigation by the construction of new bunds and wells and re-excavation of eilted and bunds will not injure the existing cultivation. It will rather improve it. The people in this district evince a strong desire to have bunds in their villages.

I have nothing

ı.B

Tanks are scarcely used for porposes of irrigation in this district. The bunds take their places bero.

## E.-Wells.

Wells also are not used to this district by coltivotics are rayats for purposes of irrigotion. But I think they can with advantage be used. The residents of the tower of Banchi cod Leherdage and their neighbourhood use wells 3 Nov. 02. 3 Nov. 03.

RINGEI; TRIPUPA CHARAN RAY. General Manager. The. 18th April 1902.

1. Q. (The President.)—How long have yoo known this district?—I have been here 8; months, but I was Settlement Officer 16 years ago for 3; years for administered estates in each district.

settlement Officer 16 years ago for 34 yeors for administered estates in each district.

2. Q. Mr. Mneoochy in his report quotes from your predecessor, Mr. Torbes, dated October 10th, 1901. On page 197 be saye—"My own opinion, stated geoerally, is that Government would not be justified in outlertaking any of these schenes, or indeed any other irrigation scheme in Chota Nnepar." And he repeats that rather strongly. Do you generally agree with him?—To some extent. No irrigation scheme would pay unless the present law is changed. Great difficulty is experienced in Government scatter as regards the maintenance of the hunds made with Government money. In Palanaus especially there are 1.200 of these hunds which are never regularly hept in order, because it is not the interest of the rayats to keep them up. There was no proper local supervicina, but this is now being arganited, and it is hoped that the bunds will then be looked after. If you make it the interest of the rayats to do so by making it illegal to enhance a main's rent on the granual of such improvement, it would be a good thing far the Government to assist the rayats generally. But natified have is changed it windle be a water of money.

3. Q. Is that what you refer to in answer to question X a Z "writh nearly to the network of the towns.

the law is changed it would be a waste of money.

3. Q. Is that what you refer to in answer to question Nn. 7 "with regard to the nature of the tenancy the wisting doubts will, in the course of the next few years, be removed "x-yes. The reyards know that if they make an ober, the landlord will certainly enhance upon the improvement. Consequently they won't do it.

won't do it.

4. Q. Is there any likelihood of legislation being affected?—I think so. At present there is a bill to amend the present Land Tenure Act, and it is to be passed into low this cold weather. I hope that is only a preliminary. A survey and record-of-rights le being made in parts of Ranchi, and from the information which will thereby be obtained the existing Act will be enacelted and a new one brought in which I bope will remove difficulties.

5. Of the levels in a time the ellewed to enhance?

which I bone will remove difficulties.

5. Q. The lendlord is not to be allowed to enhance?

No. The Bengal Tonney Act prevents that with regard to improvements made by rayats for all time. In this part it may be prevented for a certain time only. The principle is the same with a modification. Here you have the kether system which has been very successful. The termong of the fields here has been done entirely by the rayats, the landlords have need tone anything. A man turns upland into rice land by terracing it. The field so made is called a kether or khuahard or oright field. The maker holds the field so made at a privileged rate of rent for a length of time which varies in different parts. Sometimes at la for end and sometimes for a definite period. It would be better to apply this recognized principla to abore made by rayats than to introduce the Bengalsystem. The whole country has thus here terraced and the same result would happen with regard to others if the some security existed.

6. Q. Do you refer to that in answer to question

6. Q. Do you refer to that in answer to goestian 10—'I muld suggest that after the expiry of the period, for which the land improved may be held subject to ne addicional rest, the tenant may be called upon to pay enhanced roat; the new reated, however, not to exceed what the read of the land wood be at the rator next, but one below these preenting for lands of the same quality in the village "?—Yes.

Innds of the same quality in the village "?--Yes.

7. Q. Apparently the grainflar will not horrow money to improve his estate?--Where he has the inclination to improve his estate he does not have the money. He knows that if he horrows the money, it has to be distributed by his servants and not half of it will be speat on the land. He never goes to see his lands. I only know of one landlord in the whole division, who is really keen about improvements. Some wan't allaw the raysts to make only improvements themselves. The landlorath here are always more or less in debt and periodically have to apply to be brought under the Encumbered Estates Act.

The Words and Government Estates and Encumbered Estates cover, roughly speaking, a third of the whole of this division.

8. Q. Some of them, I coderstond, are permanently in the honds of Government. It is not merely that the landlord is in debt?—There are very large Government Estates.

evonent Estates.

3. Q. Arothey held on a rayatwari tonore?—Almost all. Uotil quite recently a very large Government estate in Palanan was let aut to thikudus ever suco the original settlement, but under the new settlement of 1807 it has been under rayatwari.

10. Q. Is there anything to prevent the temats availing themselves of the Lond Improvements Acts and puring their works in order?—They always hove the fear all having their reats cohonced.

the fear al having their reats cohonced.

11. Q. Even by Goverancet?—It has never been said that it should not be. The law allows it. The villagest might be put under thikedars again. Then thikedars would come in and enhance the rects.

12. Q. You think there is nothing for it but this tenant right?—Some system to make it the interest of the reynt to make the hunds and keep them is order is needed. I have seen eases where to get fish; the bunds have been cut by the raynts and then parched a lattle mad with the result that the hunds went the next season. It is not in their interest to repair them pracely.

13. Q. It is really the fear of enhancement and not

repair them properly.

13. Q. It is really the fear of enhancement and not apartly:—That they will work for their own interest is shown by their terracing. Think of the crores of rupees represented by that labour. It is all done by them, because they get a return for their money.

14. Q. In the ald days had they a security they have not now?—They had security for terracing lands which they still have. No laudlord would thunk of infraging that.

13. Q. Are there terraced lands in a better position than the bunds—Yes. The bulk of a rannindar's certal is from the rice lands, and therefore the fewer rice lands a rannindar last the less his routal. Consequently he has a keen interest in including the royms to increase the area of the rice londs.

quently he has a keen interest in including the royms to increase the area of the rice londs.

1G. Q. In reply in question 9 you say—"In all probobility there will be many eases in which a leman, desirous of making an ahar, cannot do sa, as some land necessary for the scheme is until a his onscession." Mr. Horn says they in hare a method on the Soac canals. To scenre land for village channels paid for by the villagers on the Soac canals they have a procedure by which the land is nequired by the land nequisition officer and 10 ner cent, is charged for exhibitineut charges?—"Inst would be much the expendive and much too lengthy. Some simple system is wanted such as that in force in the Kohna. The heodman af the village refers the matter to the Deputy Commissioner, and if it is naste hull it is given, and if it is somebody clee's land it is valued. The raynt who wants to make the bund pays the value assessed for the land required unless the Deputy Camanissioner is able to give the nan omsted some equally valoable land elsewhere. It works very well.

17. Q. On what anthority is it done?—Uoder the record-of-rigids.

17. Q. On what authority is it upmer—cours the records—rights.

18. Q. Is it desirable to have legislation compelling the landlard to keep his abars in order?—No. How are you to caffere it? You would have to leave an immease staff to go raund to see that these branks are being keep in order, and that staff would probably blackmail right and left and certainly live at the exponence of the rayats. To have a working system you must make make it to be interest of the rayat to keep the works in order.

19. Q. Our last witness suggested that there should be news on the land, and that the District Baard or the District Engineer should do the whole of the repairs?—He has all he can da now.

20. Q. Yau might employ another?—How can one may look after all these bunds for a district like this, or for \$,000 square miles in Hazaribagh, 7,000 in

AND ASSESSMENT OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF THE PARTY OF

Mr. F. A. Ranchi. Then, if you increase your mea your funds Slucke, will be absorbed in salories, and besides there woold be the dolay and the blackmailing by the lower subordinotes.

notes.

21. Q. You have sent in o paper by Mr. Thomsoo, Doputy Commissionor of Singhibhum, and he mentions the Kolhon Estate "for improvement of which Gevernment nilets about Rs. 10,000 annually, out of which about \(\frac{1}{2}\) or \(\frac{1}{2}\) is anoually spent for making bunds for irrigation." Does that estate pay?—Yes. But there is no recognised working programme. It is simply a case of from head to inouth, If n man wants a band and there is no monoy, it is putoff till the next yeor. I want to have some definite working plon showing for each village hew many bunds ore wanted. wanted.

22. Q. Will that require on officer especially for the purposo?—No, the talisildars con work it aut by degrees.

23. Q. Is a tabsildar capable?—They are small bunds for irrigoting from one cere to chout fifty

bunds for irrigoting from one eere to chout fifty acros.

24. Q. We have had o few projects put before us on a higger scole altogether. Do you believe in them?—I here only seen one, the Pakrahor. I certainly thook that one night be tried. The Nodown possibly. Let one be tried in order to shaw whather this opinion is carrect or not. It is founded a greet deal upon hear-ay among the people. Consequently some authorities say one thing and same another. The people certainly do believe that it such works were they would be of very great assistence, and if one were carried out, we should hove something to point to. We wont some system of utilising the water running away in these nullahs, to fill up the chars in yeors of drought. As to whether there is ony place where a hig lake can be made, there is one, I am told, on the conface of Singhbhum and llanchi, in which a very large amount of water would be stored up. It is a big volley, fed by mountain streams, and has a very narrow opening, which would be embanked and then by means of a chouned the whole plain below could be trigated. The channel would, however, have to be about 7 miles loog. The information was given me by a missionary at Chainbassa. It would irrigate a part of Singhbhum north of the railway line and near Chakardhorpur.

25. Q. Do you think that is worth investigating?—Possibly. I was told there was a great waste of natural anaterial there.

26. Q. Is it a part of the country where they would be glad to have irrigation?—Yes.

27. Q. (Mr. Horn.)—You would want a hig dam?
—I am told the opening is only 300 yards long.

23. Q. (The President.)—Is there any scope for the extension of well irrigation?—None.

29. O. Why not, because of the rocky soil?—Yest to make a permanent well is very expensive. Well enlityation is used only for londs just round the peoples' houses and they do not raine that cultivation so much as the rice.

so much as the rice.

30. Q On the other hand, a well would not fail then in time af drought?—Wells always fail at the beginning of April. My own go very deep, but I had to get water from a lake. In Hazarilagh this last hat wreather the aluele town drew its water from one tank and one well; all the rest had gone dry. One class which does use wells us the Koeries, the professional market gardeners, but they are much more advanced cultivators than these people.

31. Q. Are the people industrious?—They will work hard for them-elves, but not for nayholy else. Drink is the great curse amongst them. They comploin that we put too many obstructions to their getting drink, The Kols me the people I refer to.

32. Q. (Sir Thomas Higham.—You are not very

32. Q. (Sir Thomos Higham.)—You are not very mach in farour of making these small projects that have been examined. Have you any preference?—Ko; hat I would favour one that did not cost moch, One costs 3; laklis. I believe; I would not take that. One costs Rs. 70,000; I would take that up. I would like to take up a selection in Palanana where five projects have been proposed.

33. Q. All these schemes irrigate a great deal of Government land, and the return for them would be looked for oventually in increased rentols?—Plus the less need of cost for famino.

34. Q. How long would you have to wait for the increased rent?—The rayats would agree to pay at once with regard to lands already under rice cultivation and which were improved by the work. But with regard to other lands which land to be terraced or otherwise rendered lit for rice cultivation, a certain period would have to be given before the cohanced ront could be demanded. It would depend whother

the Board of Roycaue would occept it. The Boord of Revonue might say, as they have already said, that it is not odvisable to take on icorease of rental during the currency of a sottlement. They would, I understand, postpone carrying out these schemes until the present settlement has expired.

stand, postpone carrying out these schemes until the present settlement has expired.

35. Q. That is, in 10119—About that. They have nover expressed only opinion edecrsé to these schames themselves, simply as to the time of carrying them out. The Boord have been told that the people are willing to pay now.

30. Q. What is the Board's objection? De they think that if they woit till the end of the settlement, they could raise the reats to a greater extent?—No. It does not please them. A settlement has been made and the rentals fixed, and hence it does not seem right to the Board for 16 years to step in now and miss the settled rent, because of improvements made daring the currency of the settlelocent.

37. Q. Would it not be n good thing to carry the

currency of the settlement. Indeed aring the currency of the settlement.

37. Q. Would it act be n good thing to carry the schemes out at once even if the rents were not raised for, when the time comes for roising them, you will have hed a little experience to go on as to the value of the works?—I should say, corry out one, whether you raise the rental or not.

38. Q. You do not think you can raise the rental directly you have constructed a work before you know whot it is going to do? You might put it up to more than the rayats could ps?—I would not take the increased real from the rayats until it was shown to be of some benefit. The enquiries would not take long. These small schemes do not irrigute such large expenses of country.

30. Q. What about land of which Government is not the landlord?—I understond the zamoudars would contribute part of the cost.

40. Q. Would they?—They say so.

40. Q. Would they?-They say so. .

41. Q. In the form of taking a lean for it? A part of the cost would be debited to them?—Possioly, It depends so whether the man is impreunious or not.

42. Q. There would be no question of a water-rate in that case? They would be cattled to their shure of the water in consideration of the cootribution they mode?—Yes.

43. Q. Yoo think the moin thing in this district is to increase the number of abors through the tenants?—Yes,

41. Q. The ioducement to the tenants would be that their rent would not be raised—for low long?—It all depends on the amount of work the man has done and whether you adopt the principle of the test of Bougal or that which holds lecolly in the case of kerker.

kerker.

45. Q. You propose that at the expiry of the period, for which the kind may be held subject to no additional rent, the tonaints may be called on to pay an increase of rent?—Because that is in cooformity with the existing system of terraced londs.

46. Q. Ho would por a less rent than the rayet would who had not made the lands, who succeeded to conclude class labour. Would that be a sufficient inducement—Yes, as you see by the crares of rupees represented by the theraced lauds in these parts.

47. Q. Would you give them some right and privi-leges to make ahars:—Les, I would give them some vested interest in noking these ahars.

48. Q. Hove they not such rights?—Not that I am aware of. They run the danger of having their rents enhanced.

49. If they lind these rights, would they make them?—I don't say you would have the country covered with ahars at once. It takes a long time to get ideas to slak into their heads and to renhzo a change.

50. Q. You think they are really prevented?-I think so.

51. Q. They want some preuniary assistanct?—They have found money of their own to tooke these torraced rice fields. There are a loons for this.

52. Q. You don't think they will depend on Government for loans?—I don't think so to any great extent. If they have been able to work these fields without loans, why should they not make petty bunds, etc., without loans.

53. Q. Have you started onything in the way of agricultonl banks?—They are jest legianing. I cannot say anything definite about them. There has not been time enough to judge of them yet. They have ndranced out the money that has been lent to them, but the time has not yet come for the repayment of the first instalment.

54. Q. They have advanced money for improvements?—It is supposed to he for improvements.

The same of the

ij.,

58 Q. You have got them in overy district?—No. We have not got them in Singhhum; we could not have them there; the psople are too illiterate. We have got some in Ranchi and some in Hazerihagh; these are all that I can remember. I don't think there is one lere (Purnin).

59. O. (Mr. Muir-Mackencie.)—If I understand you correctly, Mr. Slocko, you think the zamindars are not clickly to make these improvements—not anywhere, not in any district?—Yes. You may find an individual like the zamindar of Untari doing so, but there will not be many others.

60. Q. You mean not generally, not for instence Palaman?—Well, the Itaja of Chalupur may can out some; he is a good laudlord.

out some; he is a good landloot.

Gl. Q. I understood Mr. Lyall to take a more hopeful view. He seemed to think that the zamindars, if they were oble to raise their rents, would see the adaptatage of making these improvements?—Why here that they done it before? Instead of this they are runting into delt. One can only say the proof of the pradding is in the eating of it. There is the fact that at present you have two of Mr. Lyall's most influential zamindars who are likely to have their estates brought under the Encuobored Estates Act too. They are all reckles—at least the bulk of them.

C2. Q. Mr. Lyall's view seemed to be that if they got advances given to them by Government, they would easily take the money P—They would take them.

63. Q. And would spend it on improvements, ho-cause they would be numeritately recouped, sometimes getting as much as 75 per cent. on it P—Then, if n man-could do that, why not spend bis noney on these pro-fitable nuprovements instead of recklessly getting into

stable improvements instead of recklessly getting into debt?
61. Q. He understands it is renumerative. In one of the Court of Wards Estates, in which they spent list 11,000 on improvements, they raised the rental from its. 13,000 to its. 25,000?—I have not get the figures. These improvements not very renumerouse as I have mentioned. They are so remunorative that the Untari zamiadar will not allow his rayata to carry out any improvements. He makes them all himself.

65. Q. (The President.)—There might be a respect-able zamindur who succeeds to an Encumbered Estate?—It is quite possible, but there are very few such

60, Q. (Mr. Muir-Mackensic.)—There are considerable areas under Government Estates?—Very large.

67. Q. Arr you at all satisfied with the amount done on them :- No.

(3), (). Do you consider that oil that could be done has been done?—By the rayats?

69, Q. By Government with the object of increasing its rental?—It has pont money and enhanced its rental in consequence.

70. Q. I understand you to say there are only small improvements?—Because they are only small works. You put up a bund by which five acres of land are irrigated and an increased rental obtained. Government does this. But the difficulty comes in with regard to the maintenance of these brads, which the people themselves will not do.

themselves will not do.

71. Q. On account of the difficulty of maintenance you don't think causideredle profit would be mode?—
f would ruther have the people do it themselves and keep the profit to themselves.

72. Q. The more underlying you have going about in an estate, the worse it is for that estate. We are about to introduce a system into the Government Tolanam estate by which the headman in each rillage will get a little piece of land in return for which he must among other duties look after these bunds. Of course I ceanet yet say whether it will succeed or not.

not.

73. Q. So that oven in Government estates you would infinitely prefer to see improvements in alars made by the tenants themselves!—Yes.

74. Q. You seem to me to prefer a temporary exemption from advancing the tonants' rout to the permanent exemption as being more in accordance with the custom of the country!—Yes.

75. O. Are you quite clear that would be a sufficient inducement?—Yes, because of the example of the terraced lands here.

76. Q. How far have the tonants at present in Chota Nagpur got occupancy rights?—It doponds on the will of the landlord, but they have got it under the law. If a man cau prove he has been continuously paying rent for a cortain bit of land, he has got the right of occupancy in it. They do not know their rights and it is difficult to prove them. If it cames to a survey and a record-of-rights, you will find that the bulk of them really have occupancy rights. Mr F. A.

the bulk of them really have occupancy rights.

77. Q. Has there been not record-of-rights made for the Government estutes?—Yes.

78. Q. Have they get their occupancy rights in these extates?—Yes. The Government usvor ejects their tecants like private zamindars do.

79. Q. They are liable on the Government estate to enhancement of rent nt the conclusion of settlements like other occupancy royats?—They would oven in Beugal under cortain conditions he liable for enhancement of rent.

80. Q. Is there any danger of these chors proving seless in a famine year by heing exhausted?—Yes.

Si. Q. The evidence on that point seems to me to be a hatle conflicting. The has two witnesses have been most emphate in decloring that they will hold water in a bad hother. The has we witnesses have been most emphatic in decloring that they will hold water in a bad year, nules there is some source to replenish them, they would not.

82. Q. That is to say, that soust he connected with one streams?—Yes.

some streams ?—Yes.

83. Q. Is it not likely that if the ohnes are in good condition and ne act blocked with silt, likers would be sufficient rain to fill them?—Yes, but then a great deal depends upon the time when the rain falls. It might fall in a suitable moath and then it would be oil right, and it might fall in a non-suitable moath and then the abuse would be dried up.

and then the chars would be dried up.

81. Q. Say you had 20 nebes of rain up to the middle of August and none after that, would the chars be empty:—No, I do not think they would be a lectan amount of water in them. But if your rain fell heavily in July, and you had morely scaoty showers in August, then "no."

ors in August, then "no."

53. O. You have pointed out how the advances, if made to the zamindors, would be misappropriated. Do you think there would be no similar danger if they were advanced to the toaanty?—Of course there would be in some cases, but the amount ribed would be naked for ndvances rould be very little. The rayats do not like teking advances from Government, because of the conditions under which the sums ere reclized. If the system were improved, then you might have more demands.

20. Q. With that chengo of system would you be able to dispose of any considerable sum?—I tlink so.

able to dispose of any considerable sum?—I think so, 87. Q. How much do you think you could dispose of in your division?—I should think we could dispose of four lakhs a year easily. The needs of Bougal are never met by the Government of India, I think I om right in soying that the amounts asked for by the Government of Bengal are nover granted by the Government of India.

ernment of India.

88. Q. (Mr. Rajaratno Mudaliar.)—Would you like to see the trate of interest reduced from 62 per cent. to 5 per cent. as in Madras, and the period for repayment extended from 20 to 30 years? Would that afford a greater stimulus?—I think not, because the 62 per cent. is so very little as compared to what they pay their native maingians here, and then 20 years seems to me quite long enough. If you have a proper system of intstribution and realisation, I think 20 year and 62 per cent. is fair enough.

80. Q. As regords the system of distribution, would you employ officers of the standing of Doputy Collectors?—I would employ grazetted officers of the lowest grade to go out leadily.

90. Q. What does Government may for the money.

90. Q. What does Government pay for the money?

91. Q. Then the difference between 63 per cent. and 4 per cent. ought to cover the cost of any additional establishment that may be employed?—Then you have to meet losses. If the crops fall and the mon run away, there is nothing to be realised from them and the amount has to be struck off. I have never soon any balance shoot struck, but I do not think it is a poying husiness ta Government. After you take your 4 per cent. away, then I think Government loses.

92. Q. Then, as regards realisation, what are the hest means? You have no village agency for that?—Yes, in several of the districts here, we have a village agency for thet. We have a recognised headman in some places, he is called a movada and in other places

Ben.

3 Nov. 02,

かんかんできる はっているこう

1

ijij

14

Mr. F. A. ho is called a mauki. Ho is the recognised headman Slocks. of the village, and you coo work through him.

93. Q. You said you would prefer to see abars con-otructed by the tenants. I suppose they will be able to construct ohors may in their num heldings. When an nhar folls in another man's helding on they likely the combine?—No. There is n want of combination

among them.

94. Q. In such cases whot is to be done? Government, I cupped, englit to step in in such cases?—If it were absolutely necessary, they would do so. In a country administered like the Southel Pergunnahs the Sub-divisional Officers call the principal men together and get them to combine and carry out this wark.

95. Q. As regords the privileged rates of rent; that so far has octed as a stimulus in inducing the people to terrace their londs?—Yes.

96. Q. You proposed to extend that system to ohors ?—Somothing unologous to that system.

96. Q. You proposed to extend that system to ohors?—Somothing analogous ta that system.

97. Q. Wa horo something similor in the Modras Presidency, but there a condition is attached that if the works are not maintained in proper order, the concession is liable in he withdrawn. Would you adopt that system here?—No. That implies that somebody should go round, which generally ends in eight ouns in a rupe being taken and a lot of other evils. If it is not in a man's interest to do this, he goes away and the land is let to another person whose interest it will be in do in.

98. Q. The tonants here have no saleable interest?—No. Woll, at present there is nothing against it, except that there is no mention made of the transfer or sole of ready heldings in the Clutch Nagpur Landlord and Tenants' Act. Up till quite recently they have not had any right in soll their londs, but the practice is goddinily and very slonly creeping in. In the anneaded Bill that will be introduced in the Council, I understand a provision will be introduced to probabit the sale of rapid heldings altagether. Hitherst this practice has never been recognised by anylody, but by their contact with more highly advanced roces the people are gradually coming to imbile the idea that they have a right to sell their holdings, which is not good for them, because they are very that the present ones like an one-approach construct of the present of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part o

99. Q. Mr. Twiddell, in answer to questian No. 10-says that "an irrigation cess like an embankment cess might be imposed to provide funds for the construction and maintenance of tauks and pains". Do you ap-prove of that proposal?—No.

100. Q. (Mr. Allen.)-You know the Saran Dis-let well?-Yes.

101. Q. For bow lnng ?-2j yeors.

102. Q. How long agn was that?-I left it in the middle of 1896.

102. Q. How long agn was that?—I left it in the middle of 1896.

103. Q. A good deal of ovidence has been given before the Commission as to the advisability of improving what are known as the Saron Comals and recouping the expenditure involved by imposing a water cess on the district as a whole. What would be your opinion?—If would no quite unfoir, because the bulk of the londs in Saran would never get any benefit from the water, and to assess them because of the improvements made in these canals would be quite unfoir. The district is shoped like this (witness explained how the district was shaped in the map and also how it would be impossible for the lands he referred in getting a pice worth of benefic out of any improvements that would be made). Continuing witness soid—Yim bove spent seron lashs of rupes on these canals and nothing has been done, and if you spend another seven in twelva lakis, nothing will be done, and you will be spending good moner after bod. The year before last I was Revenne Secretary and the point canon pobout the opining of these canals. The District Board, the Collectir and the Commissioner wrote dawn to Government to pass orders to have these opened. Mr Buckley was thea Secretary to the Gavernment in the Public Works Deportment. He drow up a very good note showing how hunch had been lost in the post; but then the pressure was too great and the order was passed to open tiem and then what was the result—4,000 acres only were irrigoted.

104. Q. It wos also suggested that the water level would rise and so wells in thier ports of the district would rise and so wells in thier ports of the district would rise and so wells in thier ports of the district would rise and so wells in thier ports of the district was the result rise and so wells in thier ports of the district was the result rise and so wells in thier ports of the district was the result rise and so wells in thier ports of the district was the result rise and so wells in thier ports of the district was the result rise and so wells

104. Q. It was also suggested that the water level would rise and so wells in other parts of the district would benefit olsa?—That is very doubtful. If the water level rises, it would mean more malaria. If you have a water level very close to the top of the district, it means a molarious district.

145. Q. (Sir Thomas Higham.)—What is your opinion about these conels?—What do you think is wanted?—Nothing.

100. O. (The President.)—The argument was that the silt clearence was not properly regulated and that the water when it was given came too late to be an any use, and that the canels only wnoted to be put under proper ogency—If the people of the district helieve that, why do not their own District Boord toke it up.

toke it up.

107. Q. The District Beard advocated it?—But they don't advocate the spending af their own money.

108. Q. (Mr. Muir-Mackenic.)—They said the district would be willing to pay?—It has not been levied yet. These men who said so were not speaking on behalf af the rayats. I doo't think you would find that the rayats. I doo't think you would find that the royats would egen to pay an extra cess.

109. Q. (Sir Thomas Migham.)—They send water down here (indicates nn map); dan't they?—It is not of inuch use. The people who get most benefit from this water here ore the focturies.

110. Q. A good many people get benefit from the focuries, because the lectories are clongside of that nullah?—Yes, there use to be fecturies. There are deserted factories along there now.

desorted incurries along there now.

111. Q. (The President.)—But there was much absolute ucanimity of opinian from the Commissioner downwards that this place would have its salvotion worked out?—If they are so ucanimus about it, they ought to urgo the District Boori th find the monoy required and look after the scheme. Then you will full they won't burden themselves with it.

112. Q. (Mr. Allen.)—About this Eacumbered Estates Act you say about non-third of the division is under Government administration?—More than one-third. One-third is under the Encumbered Estates Act.

113. Q. Do ynu consider that sufficient money is speut an improvements in these estates?—No.

113. Q. Do you consider that sufficient money is speut an improvements in these estates?—No.

114. Q. Whot is done?—There is na warking plon; an system whotever, and everything is subordinated to poying aff dolts; whereos under the low (section 4) unprovements come before paying off debts.

115. Q. What you think should be donn?—I think myself that when a scheme is sent up to the Board for approval, it should be made subject to revision or report of the Collector or Deputy Commissioner when he knows the tract and is in a position to say how much is required for improvements. It is said in the Act then application shell not ordinarily be subolited by the Commissioner without the coasent of the Lioutenaut-Governor unless the debty con be liquidated in 15 years, and that "ordinarily" is generally not read, so that in scheme is sent up unless it is made and that the debts can be ilquidated in 15 years. Therefore everything is subordinated in the liquidation of debts, whereas the law says the cost for improvements should coince before the liquidation of debts. Therefore there should not be any great stress loid upon the length of time for which the estate should be retained under Government management, and the scheme should be accepted subject to the possibility of its being revised when the Deputy Commissioner knows actually the needs os regards improvements for the porticulor estate.

116. Q. (Mr. Muir-Mackenie.)—I understood von to

needs os regards improvements for thot porticulor estato.

116. Q. (Mr. Muir-Mackenzie.)—I understood you to say that even an estates managed by Government you would prefer that the improvements should be unde by the tenento?—Yes, if you con get it done by the tenents?—Yes, if you con get it done by the tenents. You could not get it done now. For instance, as I said just now, there is o want in combination animing the tenantry, and then of course you will have several cases in whilet the worlds ore too big for them to carry out. If you choose to wait your, and years, then the rayots themselves moy do it; but if you don't care to do that, either Government must step forward in Government estates, in Government must take the place of the proprietor in carrying out the improvements in the enclimbered estates. There was a case came up then ther day in a very hig nlar—an old one which had cost Rs. 4,000, and you could not get the rayats to combine in tolar the silt out if it unless you redneed their rosts. Similorly, there are very many other ahors silted up, which you could not expect the rayats to attend to but the zomindars. I am having them included in the famine works programme, so thet when any famine comes, they shell be taken up as famine works.

117. Q. Is it the case that a great number of estates in the interior comes that the states in the string comes to not in the suffer her parts to the string the string comes to not the sum or suches.

117. Q. Is it the case that a great number of estates in this division come at one time or another under the Enembered Estates Act?—Yes, or under Government management. You have got 44 or 45 per cent of this division now in Government hands, and there is another hig estate coming in shortly that will increase it more. In this division ? of the estates are in Government bands.

III. Q. If its of that, the on by the Enumerous of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the order of the or

118. Q. If a more liberal policy is parsued in carrying out improvements in these encumbered extrice, a greet deal of good will be done?—Yes. As matters stand, the only good, as for us I can see, that is done by the Encumbered Estates Act, is to prevent the people coming into the bonds of ulion landlerds and to pay off the oreditors. There are many eases in which estates after being released have ngain bent taken under the Act in a few yeers time. Proprietors during the time the estates is being managed surreptitiously berrow money at heavy interest and on the estate bang released confirm all their engagements with the result that they are swamped and then apply again to Government to be taken back under the Act.—119. Q. (The President.)—This is a policy for the protection of insalvent landlords?—It saves the people meinly.

120. Q. (Mr. Muir-Mackensie.)—On the Gororment extates if the enhanced rents are maintained, is it not surely the duty of Government to repair these extets?—That is new being dene; efforts ore new being made to keep them in repeir, but it is not the duty of Government to repair nat-holes. If nt present there is a rat-hole in a bund, the people do not try to closs it, and so by degrees it ollarges, and if nething is dom, it gets bigger and bigger till famely the bund is destroyed. The motive's business will be to see that the raysts carry nut at their own cost potty repairs like thet. Big repairs will be done by Government.

121. Q. Is it not necessary for the make to have not his back my compulsory provision?—No. A man would not be appointed as makto if he had not enough neval force ar power helind him to command the raysts.

ce. The supply generally fails in October and
November, when the canal weter is most needed,
there being no pucces aniout across the river
Damodar from which the supply is received.

(7) Ne. (8) No. (9) Ne.

There is a strong desire evinced among the people to bave means of irrigation extended.

# C .- CANALS OF INTERMITTENT FLOW.

2.
(1) There are two elnices in the Damodar left ombunk-ment through which Damodar water is sent down to the Banka nata by two channels. The Benka river is provided with on enices and beed elnice through which water is admitted into the Eden Canal.

(2) There are two distributaties and some nadis which are fed by the Eden Canal. In the distribu-taries there are regulators and permonent entitles through which water is distributed to the land.

(i) The irrigation increases the value of the produce of the land by increesing the yield.

(3)

(a) By increasing the yield one-and-a-helf times (vida Form No. 74 S. W., 1899-1900).

(b) By increasing the yield doubly (vide Ferm No. 74 S. W. of 1900-1901).

(2) By the too early occeation of the supply, quarter of the value of the irrigation is diminished.

 Approximate estimate of the increase in the tetal nunual value of the produce is Rs. 17 per acra. 17.

(1) Annas fifteen ond pies one-and-a-half on the area ordinarily irrigated.

(2) Nil.

(3) Niz.

18. The only private expenditure necessary to bring the water to the field is by constructing village channels; it is generally incurred by the tenant, and he has ne accurity for recompment. Unfortunately there are few village channels.

recomment. Unfortunately there are rew rillege channels.

12. No damage resulted to the people, nor detarioration to the soil from irrigatine from any canes. Bother, the allorium carried by Damedar water has improved the quality of sail of the tract irrigated by the Eden Csnal. Eden Canal system serves the purpose of irrigation as well as drainege of tha land irrigated from it.

as draioege of the land irrigated from it.

20. Annual maintenance estimate for repairs and silt-clearance, etc., is sanctioned by Government. The approximate annual cest per acre irrigated is one rupe. exclosive of cost of establishment and tools and plent. The system is not working fairly well, and new legislation is required binding on the individual onlivators to pay water-rate and expectating a special estificate efficer for the Eden Conel (crize Revenue report, page 80, of Eden Canel far 1899-1900).

. .

4. 

- 1. Q\_(The President.)—Have you been a long time fu Irrigation?—Yes, nearly eixteen years.
- Chakrararti. 2. Q. Do you know the Burdwan and Hosphly Districts
  6 Nov. 02. rery woll?—Yes,
  9. O. How lose have van been connected with them?—
  - 3. Q. How loag have you been connected with them?
  - 4. Q. Then yan are naw in charge of the irrigation?—Yos, the Eden Canal.
  - 5. Q. You said in reply to question No. 6 there is no strong desire among the people to have works af irrigation extended? Yes.
    6. Q. To what extent is this desire strong? I suppose they are ready to pay for it?—Yes. They are ready to

  - 7. Q. How much do they pay for irrigation by the Eden Canal?—They pay at present variance rates; they have long leaves, season leases and fluckings. For long leases they pay 5 annus for a bigha.
  - 8. Q. (Sir Thomas Higham.)—What do you call n bigha?—Thoro are 3 bighos to the ucre, or, ta he more precise, 3,025 bighas represent an nore.
    - 9. Q. That is nimost n rupeo nu acre?-Yes.
  - 10. Q. (The President.)-That is far long leases?-
  - Q. And for season leases?—For season leases they
    pay night unuss per bigha, and for one flashing they pay
    four unues per bigha.
  - 12. Q. For long leases they get water as long as the canal is ranning?—As long as the crop is ripening.
  - 13. Q. After the crop is ripe, da they get a second capply ?—For this they make separate agreements.
  - 14. Q. What is the rote for rabi?—One rupes per bighn; that is, three rupees per acre.
  - 15. Q. Does my person take it at that rate ?- Yeo.
  - 16. Q. Then why do they not pay more for the kharif?
  - 17. Q. They take this water every year?—Yes; very generally new-a-days. Every year latterly there has been a deficient rotufall. This year ulso they had no roinfall in
  - 18. Q. Did not the rain fall last mouth ?—Very little; only 105 in the whole of the mouth of October.
  - 19. Q. You do not seem to increase trigation in the Eden Canal ?—It cannot ho increased, hecause there is no regularity in supply from the river Demudo.
    - 20. Q. Do you get the fall duty on the water ?-Yes.
  - 20. Q. Do you get the fall duty on the water r-xes.
    21. Q. Is all the weter used every year?-Yes. The
    difficulty is there being no weir; the supply in October is
    reduced very considerably; we have at present 26,000 acres,
    and this at the duty af 80 acres ecquires \$25 cubic feet of
    water per second. There is no hepo of dovelepment. The
    average supply during last Oatoher was \$5 cubic feet per
    second. I have got a statement which I have prepared second. I have got a statement w
  - 22. Q. How are these taken?—From the sluices by means of the claice formula.
  - 23. Q. (Sir Thomas Highom.)—How much water have you to supply ?—There are 26,000 long leases in force.
  - 24. Q. (The President.)—You say you here regulators in the distributaries? Yes.
  - 25. Q. And you work these regulators onlirely for the sake of irrigation?—Yes.
  - seke of irrigation?—Yes.

    26. Q. Was not the canal made as a canitary work?—Yes; the first object of the Eden Canal was to sapply drinking water; afterwards, whose the canol was re-opened in 1881, the demand for irrigation rose, and from 1882 they are trying to work by means of an open ent. We are finding that gradually the mine entrance to the channel is heing slitted up and the sapply entering the council is failing, so the sapply is very limited, and therefore satisfactory irrigation is not going an.

    27. Q. Which has the first thing the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the
  - 27. Q. Which has the first claim, the Sanitary Department or the Irrigation Department?—The abject of the canal was to moke it a senitary canal, but we cannot do that; we have already undortaken some long leaser, and we are bound to supply water.
  - 28. Q. I cannot anderstand how you can take long cases?—That I canaot answer.
  - 29. Q. Since how loag have these loag leases been given?
  - 30. Q. For the last ten years?-Yes.

- 31. Q. Has there never heen any complaint from the Sonitary Department P—Na; we are trying to supply whenever possible for drinking purposes.
- 32. Q. Your long leases are at 15 ennss per nere?-
- 33. Q. I see Mr. Maconchy calculated on having long leases at Rs. 1-8 per acre?—Xes, that is the view of the people; they are willing to pay at the higher rate if the sapply can be made satisfactory.
- 34. Q. He estimated that there would be n revenue of Rs 1,44,000, or for each section only Rs. 28,831?—Yes. That is because there is na weir or regalotor.
  - 35. Q. It ultogether dependa upon the weir?-Yee.
- 26. Q. The weir will cost about 8 lakes of rapees?-
- 37. Q. Have yan over seen anything like a famine in this district? Have you ever known people dying from want of food?—No.
- 38. Q. Hos it ever been necessary to open relief works?

  The materiol condition of the people is not good. Some relief works were taken in hand.
- 39. Q. Bat not for famine?—No, because no death or anything of the aort has taken place in Bengal on account of famine.
- anything of the nort has taken ploce in Bengal on account of famine.

  40. Q. What is your opinion aheat a weir? Is it necessary to have this werr across the river?—Yes. I here a little note if I may be allowed to read it. The ally colarion of the difficulty, in my opinion, is the construct a weir screece the Damada, but I would not recommend it to beconstructed at Jocjooty, but somewhere higher up near Baniganj and to make a cat nearly 50 miles in length to cenest it with the present canal, as the present wair at Jocjooty will intensity the evil of the rapid silting any of the entrones channel at Jocjooty which is ahaat helf a mile long. At present the silt clearance is done hy manual labour, but the cost is gradually inaccasing owing to the increasing head and lift. If a dredger could be employed through the whole length of the channel, the matter centil he simplified, hat this cannot he done in the present state of the entrones channel at Jocjooty.

  41. Q. Why nat?—Becasse it is only 50 feet wide at the main catrance and that the drager will not cator; and, secondly, it is 600 feet long; 600 feet from the cloice. I think it would be much cheaper to baild a weir at Raniganj, and there is every probability of the canal water being wanted for irrigation in the traot between Baulganj and Burdwan which is more liable to famine and is drior than the cocantry lower down.
- 42. Q. Between Raniganj and Bardwanf—Yes. I um not in favour of widening the existing sand and regalators, or the coastraction of Pulashy distributaries, but the canalization of some of the old streams, each as Khorey, Banka, Kenthi etc. in desirable. Konski, etc., ie desirable.
- 43. Q. Do you think, if these works were carried oat, the thing would pay?—It is very difficult to say. Of cearse I can say it will pay comething, but I do not know how it will stand in the long run.
- will stand in the long run.

  44. Q. The Government may perhaps be willing to make it if it does pay, ur if it would amount proctically to protection from famine and loss of life, but in a place where famine and loss of life, but in a place where famine and less of life does not cour, I think the Government would say that the people who are going to braself the earnal should pay and not the whole centry?—There ere some leading ramindars who are willing to contributs to the cest, as during my own investigations I came to know. There is one mun, Bamo Cherau Bhor, of Haripal, whe is anxious to pay Ho. 15,000 for the restoration of the Koasiki. Baha Amrito Lell Seal, of Satgachin, in willing to contributa Rs. 20,000 for a weir acrose the Danke; Bahu Bepin Bihary Ray of Daghara io willing to spead Rs. 10,000 for a regulator in the Kana Nadi.
- 45. Q. Do you think the people would take water every year ?-Xos.
- 46. Q. Do people is the canal area take takavi udvances to help their works and improve things ?—No. I am nat nware af any one doing so.
- 47. Q. Do they never take it?-No, at least so far as I
- 48. Q. Is there any well irrigation in that country?-
- 49. Q. In most years there is enough of water, leaving out the last few years?—Of course there are records. I was there for five years; there was recreity during those years; there is wont in every ten years.

56. Q. Then what area do you get short lenses for?—The season leosecare for about 3,000 acres.

57. Q. Kharif or rabi?-Khurif. The rabi is very little; about 400 nones.

5S. Q. Have you done altog-ther 29,000 acres within the last seven years?—Yes, of which 26 are on long leases and three on short.

50. Q. And the people prefer long leases ?- Yeo, because the rate is cheap.

60. Q. Since when have you been receiving long leases?

—For the last 10 years. I cannot supply them water in Outsher; I and the greatest difficulty in keep them eatisfied.

61. Q. Some years ago abent 70,000 coros were worked instead of as at present 29,000 cores ?—Yes.

62. Q. What is that due in f-Of coarse I was not in barge of the cenal of that time.

63. Q. You must hereoften wendered at the drop?—I om denhtful whether fully 70,000 acres were irrigated. Another thing is that at that time this wes a new irrigation introduced and people were very willing to take advantage of the irrigation and they voluntarily executed the lesses without knowing the consequence; that le what

64. Q. Did they get them un long lesses or un short sooson leases f-Oa long lesses. Formorly the long lesses were for five years at a very low rate.

G. Q. If they leased 60,000 acres for five year, next year there would be semething over thet, would there not? but the next year they dropped down in 11,000.—That was the first year. Some of them did not pay.

60. Q. If you could irrigate that quantity, then why cannot you do so now?—I am doubtful whether this area was properly irrigated, because where was the supply to come from?

67. Q. We know bow, 20 years oge, you could irrigate 70,000 acres, whereas now you cannot irrigate 30,000?

That was only ahnormal. Next year it was only 11,000.

68. Q. You said that you cannot give a leasn for more thou 20,000 ?—Yes, and even then not properly.

thou 20,000?—Yes, and oven then not properly.

69. Q. I cannot see how you connot?—There is a special reason for that; formerly from the entraces of the channel water was serviced to the view tanks. From here an anlert hoe been mode and canal has been taken out. New this Banks was formerly very deep and during the reiny ocasen water used to come io. Naw the Banks has eited up, so much so that the water does not enter properly. That was nonereason also. I find in 1800-01 I was shie to supply 200 oubic feet. In 1901-02 this was reduced to 95 cubin feet per second, and this yeer it has gone down to 85 cubic feet per second owing to the doctorization of the Banks.

70. Q. These 10 miles in the outrance of the canal, which has silted up, concetyou clear it up?—Yes, but at mormous cost. To clear the block for I mile the cost will be Rs. 10,000 or Rs. 11,000; for 10 or 11 miles you can imagine what the cost to clear the Banks would be. In that case the canal would not pay at all.

71. Do you think people will take water to the full extent

71. Do you think people will take water in the full extent of the apply?—Yes.

of the anply ?—Yes.

72. Q. How many acres per year?—I think altegether 90,000 acres in October in this district of Burdwan as well as in Hooghly.

73. Q. Yon cold that the Irrigation of 69,000 acres has fallen to 30,000 directly they pay water-rate?—Yes.

74. Q. Then why do you think it will increase to 30,000?—At present they council get water when they want it. Irrigation is not going on satisfactorily, but if we can make it satisfactory by means of a weir or by means of a proper ent, I think they will all take the water.

75. Q. Then you think that the reason why your irriga-

75. Q. Thou you think that the reason why your irriga-tion has fallon off is that you cannot get it oatisfactorily?

—Yes, that is what I think.

76. Q. How many square miles do you commond? Roi Durga —50,000 acres are commanded at present. We have 200 Charan square miles above Burdwan and 200 square miles near Chakraoarti. Kanchangar.

77. Q. How much du you irrigate per square mile? 6 Nov. 02.
-At present I irrigate in 300 equare miles only 26,000

nores.
78. Q. That is 30 acres to the sopare mile?—Yes; something like it. In 800 square miles we irrigate a total of 25,000 acres, so it is about 32 acres to the square mile.

79. Q. That is not n very strong demand for irrigation?

80. Q. If you make this weir, will the caual command more country then it does at present f-Yes, they will take up lend and put in new distributaries.

up lend and put in new distributaties.

Si. Q. Why do you say that legislation is required to hind the individual cultivator to pay water-rate? Do not they pay water-rate when they take lesses?—At present the system to this t the lesseholders oro bound to pay water-rate and the outlivator is not. Whenever the lesseholders go to the Givil Court to recover the cultivator's share of the rotes from them, the lesseholders do not get decree, because they have not taken any hinding agreement from the cultivators. The Munsil's generally give their decisions sgainst the lesseholders.

82. Q. Cancot they provent cultivators from taking tha water?—They cannot prevent them, become one outlet applies the water to all the villagers. One cultivator's land may be just in front of the channel, and the others who are willing to pay may have their lands just on the other side.

83. Q. You have no difficulty in recovering from the camindar?—None.

84. Q. Is it very difficult to recover from the cultivator? 84. Q. 10 it very difficult to recover from the cultivator?

— Yes. Those men do not pay regularly and we are obliged to have recourse to the certificate procedure. Lease-bolders here an means of putting pressure on the people; the have we any means of putting pressure on the people; the last resource is the Public Demonde Recovery Act.

Sb. Q. Cannot they increase the zent of the cultivators?
No, because the landlerd himself has done nothing.

86. Q Has the district ever enflored from famine?-No, but from information I have collected I know in 1874 tbero was n famine.

87. Q. Did they have any relief works ?-Yes, they had some relief works in 1896-97.

88 Q. Where were you then !-I was in the Bohar mino. I was on the Sone Canal. In 1896-97 I was in Mnzaffarpur.

80 Q. Do you think it would be better to bring the canel from Rangenj than from a lower place?—Yes.

canol from tangany tana from a lower place f—X cs.

30. Q. Why?—Becams if we make a weir just at
Jesoty, the present head of the mein suirance of the
channel will he silted up and dredging arrangements much
he made. At present a dredger cannot be worked. Another
reason le that the country or trast of country hetween
Raniganj end Burdwan is more lieble to famine.

Raniganj and Burdwan is more liable to famine.

91. Q. The cost of the anal from Raniganj is estimated at from 70 to 40 lakhs; whereas wou in this other place will only out ton lakhs, so that the proposel you ndvocate will be spight times less costly?—My idea is quits different from the one Mr. Misconoly has recommended. My idea is simply to make an anient at Raniganj and to make a chemnel from Raniganj to join with the Eden Canal. That would reduce the cost. According to my estimate it would cost about 8 lakhs of rupees for the weir, and this 50 miles of canal at Rs. 20,000 per mile, which would be about Rs. 10,00,000 renghly, altogether shout Rs. 18 lakhs.

lakhs.

22. Q. You are not at all in favour of having navigation?

—No, hecanse it will not pay. Where there is railway competition I don't think it will work estisfactorily. There is very little water in the Domeda and you cannot got more than 1,200 onhie feet in October and November, and with this supply newigation and irrigation will not work properly, 93. Q. One thunsand and two handred cubic feet will be enough?—Yes; at present the Eden Cannot cannot carry more then 800 cubic feet.

23. Q. You propose in ordered the kriestics of the

94. Q. Yen propose in extend the trigation of the Eden canal?—Yes; at present, if I can get 800 enhic feet, it can be properly worked, but there is no water and I cannot supply. This is the reason why I am niwaye in

95. Q. (Mr. Mair-Mackenzie.)—Mr. Horn gives it as is upinion, that in the Burdwan and Hooghly Districts

٠, \*\*\*

A PROPERTY OF THE PARTY OF THE

And the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of t

Rai Durga the rice cups are never known to fail. Is that the cass?

Charon —In the high lands it fells sometimes.

Chakravarti. 96. Q. In lands where approaches are likely to be

Charon —In the high lands it fells sometimes.

Chakravarti. 96. Q. In lands where approaches are likely to be dammed, has it ever been known to fail P. Not very much.

Of course a certain pertion sometimes fails.

97. Q. (Mr. Rojoratna Muddler,)—You said leassholders find difficulty in recovering water-rates P.—These ore representative cultivoters. There are no zamindars in many cases.

- 98. Q. They are headmen ?-Yes, they are head setnally, but some of them boye no interest in the land.
- 99. Q. Then why don't you deal directly with the cultivators—It would be a very ombersome process. As far as my experience goes, every individual enlitivator's land will severally bove to be measured, and every individual and unlinear enter will have to be collected from them, and in case they do not pay we would have to issue cortificates against each individual cultivator. So this wenld be n very combersome process.
- rery onmberseme process.

  100. Q. Your revenue establishment coste Rs. to collect Rs. 25,000; that is, about 45 per cont. P—But that does not include only the men sumployed in collection. It slee includes these compleyed in the distribution in water as well as engineering works. Our callection and ongineering and distribution in the E-len Canul are ell in the hands of one stoff. In other canuls they have a separate staff for revenue collection and engineering.
- revone consection and engineering.

  101. Q. Woll, your average area is less than 30,000 acres; don't you think your present staff would be able to measure, assens and callest also ?—Yes, with a little addition. If we have to deal with the individual cultivator, we shall require na additional establishment.
- 102. Q. What advantage de these landlords derive !-121 per cent. commission.
- 103. Q. That does not appear in your revenue necessaris?

  Yes. The system is when we take the mater-rate we take the net amount assessed in the account.
- 104. Q. If that amount is spent on increased establishment, will it not be sufficient?—There must be the headmen te lead these rayats us in other places. There must be ene man te give assistance.
- 105. Q Counct yen adopt the block system ?—Yes, I am trying to introduce it.
- 106. Q. That will ge a leng way to reduce expenditure?

  —The block cyctem does not reduce expenditure; it prevents unautherised irrigation.
- 107. Q. Individual fields in the block can be surveyed once for nil?—You must make a man responsible for that. One cultivotor must be responsible for the water-rate. That man's name must be taken dewn, his residence, hie father's
- 108. Q. Supposing there is a bleek of 50 acres, and these 50 ocres are held by 5 er 6 men, each man's ores will be known, and the holders lu the block will apply for leng leases f-Individual helders will not de ee.

109. Q. Why dan't you take lesses from them individually P—We have from 300 to 400 men in such village; how many lesses will there be f—It will be n most enmbersome process.

droaghti

40. Q.

gad rate 11. Q.

- 110. Q. All the men in the block will apply in one lack ?—Yes, and there must be n headman.
- III. Q. Why is it necessary?—So that he will be able to identify them.
- identify thom.

  112. Q. Once you carry out the system, no further inspection will be necessory. The londlord will be beand to pay whether he takes the water or not?—When a man's deld fails, will he not come in with a complaint that woter has not been supplied; then who will make an investigation. So overy case will have to he deelt with.
- 113. Q. Is the difficulty insoperable ?—Then in every particular field guards must be introduced; we will have to have a record of each particular field; otherwise in cases where there will be investigations there will be no record to show that a particular plet of land was not supplied with
- 114. Q. Wen't your canal officers find tims to do this ?-
- 115. Q. What is your present staff ?—At present my atesf consists of two zilladars and one sub-overseer.
- 116. Q. Have you upper subordinotes ? No; there are also certoin special officers.
- 117. Q. Are there no upper embordinates P.—No; in the canal staff there are special officers and temporary zilladars.

  118. Q. What addition would you require to year staff P.—If we are to deal with individual oultivators, I think we will require considerable addition to our staff.
- think we will require considerable addition to our citif.

  110. Q. Would the cost he probibitive?—No, but these things dayend upon the anpply. Unless you increase the supply you cennet do mything. I think emply ebould be increased, because at precent every year the amply is getting reduced, and it because very difficultie keep up the irrigation. Then each zillodar will have to be emplied with two more mohnring, and then I shell be oble to manage with individual cultivators, so that to this commission at the rate of Rs. 122 per cent, which comes to mbout Rs. 3,800, will have to be added, say, Rs. 2,000 a year, 120. Q. That will be a little more than 101 per cent.
- 120. Q. That will be n little more than 123 per cent, ?— I wish to redoes it to 3 er 5 per cent as they allow on the Sone Canal.
- 121. Q. Are you in fevenr of extending the term of the lease?—To more than coven years, ao, because even with the seven years we have difficulty. Leasebelders may die; cultivation may change bande. I would not recommend the extension of the lease to mere than seven years.
- 122. Q. Have the oultivators net occupancy rights?—They sell their rights or become poor, order some reason er auother their lands obange hands.
- 123. Q. Such cases may be treated specially and previded for ?—Yes.

WITNESS No. 61.-Ms. B. FOLEY, C.S., Collecter of Burdwan.

Mr.B Foley 1. Q. (The President.)—Have Enrownn?—Since May 1899. -Have you been leng of

- Birdwinf.—Sinco May 1899.

  2. Q. Yon say in reply to question No. 5 that there was famine in Birdwan in 1874 and severe distress not amounting to famine in 1874; or you happen to know what did happen in Burdwin in 1874; were there deeths frem famine?—As far as I know there was a great deel ef distrese in Ranigonj; n great many peeple came in from Bonkom; there were a let of relief works in Raniganj.

  3. Q. Yon don't know hew many men there were on finding relief in 1897?—I cannot say definitely, as it was before I went to the district. A few kitobens were opened and there was come relief given by the Burdwan Raj in Burdwan and in several other centres. Of conrest here was a strong feeling that in 1874 it was comewhot overdene; I mean that it was not se serioue as it appeared.

  4. O. Generally openking of the district, wentd yon say
- 4. Q. Generally openhing of the district, wenld you say that it is within the famine area of Bengal P—No. I abould say it is practicelly impossible to have famine in Burdwan except under very exceptional elecumstances.
- 5. Q. Such as practically do not exist at present?—I should say so. Except in some small local areae, where the land is poer, famine is impossible.

- 6. Q. Yon say at the beginning of your answers that there are Government irrigation works. Is that the Eden Canal ?—Yes.
- Q. Questions concerning that canal come before you?

  -Yes, occasionally complaints of want of water required.
- S. Q. le it popular? De peeple set etore npon it?— Yes, people accasionally apply to me and say they cannot get water. Thie is principally in the month of October.
- 9. Q. Is it your impression that the irrigation is really popular? Is it in thing that the people are glad to have?—Yes; it is popular.
- 10. Q. I suppose it is practically all rice?-Yes, rice
- 11. Q. What is the population of the district?-
- 12. Q. Hes there ever heen any proposition for irrigating in Bardwan except from the Damada river?—No, I don't think so.
- don't think so.

  13. Q. From whot yen know of the district, do you enprose people would take irrigation and he willing to pay for it every year?—They would pay o certain amount undonbtedly every year for irrigation, but whether they

would pay enough to make the scheme for icoreasing the water in the canal is doubtful.

14. Q. Is there may well irrigation ?—I have never seen any, bot have learnt from the District Engineer that there is a little from smell kachcha wells near the Damoda in oen

- 15. Q. Now, with regard to shellow reservoirs and tanks, mo there many of both?—Yes, o good meny.
- 16. Q. We found out at Gyo and clearwher it was very cammon thing in those parts where is n slight slope to throw bunds errors the country and confine the water?—
  This is not done in Burdwan, so the country, except in Ranigaoj, does not lend itself to thie.
- 17. Q. (Mr. Allen.)—Your tonks are dug tanks?—Yes nearly everywhere. The other system is in some places osed in the Raniganj District.
- 13. Q. T suppose you have no demand for loans for land improroment?—Yes, there are demands; I have been attement showing the figures for the past ten years.
- 19. Q. Do you know what they do with these leans-they employ the money ?—For making tanks mostly.
- 20. Q. Tanke with the view of irrigation or for drinking purposes?—Irrigation mostly.
- 21. Q. and these tanks are dug tanks from which water liss to be lifted by merhonical means?—Yes.
- 22. Q. De they irrigate rice from these tanks ?—Yea, mostly from them.
  23. Q. Tont is an a very small scale?—Yes.
- 54. Q. (Mr. Muir-Mackenzie.)—A great deal of lifting goes on from these tanks?—Yes,
- 25. Q. (The President.)—You say in reply to question No. 9 "extensive Irrigation . . . . . . . . . . . . . . . . . water may be distributed." Then you say they are necessary; do you mean they are netunlly necessary to protect the district from scarcity?—No, I should have said the works would be advantageous ar expedient; they are not absolutely necessary.
- 28 Q. (Mr. Muir-Muckensie.) I anderstand from you that there are a great many tanks all over the country from while they, fift water. When is this done? In Other to maiure rice; sumetimes also for transulanting by 1-1.
- 27. Q. Never for sowing ?—I have not noticed it being done for sowing, but it may be done eccasionally for seeding but. It is done for tronsplanting and also in Octaber.
- 28. Q. Do yan think as many of these tonks are dug as ore required?—I believe that a number of the tunks that were dug for this purpose have silted up.
- 29. Q. There are no bunds octors the country?-No.
- 20 Q. Do you think people will be able to clear out their old tanks or to dig new tanks If advances were given freely?—Yes, to no creain extent. In the present year I have Re 3,000 to spend in advances. I have received applications that will cover more than that
- 31. Q. You think you will be oble to dispose of Re. 8,000 ? Yos, easily.
- 32. Q. Did you ask for more than Rs 8,000 9-Ro, it was addited.
- 33. Q. Wers you coosulted before the ulletimest was undo !- As far as I remember, no.
- 34. Q. tlew much do you think you can got tid of in on ordinary your f-Iu nu ordinary your wilb o good rain-fell nothing is wanted.
- 35. Q. In the present year and last year how much could you have get sid of if you had carle blanche?—About doolle the ann-ant, I believe, in the present year. Making a gursa, porthaps the semo unuount could have been disposed of last year.
- 36. Q. About Rs. 1C,000 !- Yes.
- 37 . Q. You could not get rid of half a lakh ?- No.
- 38. Q. (The President.)—In a year of exceptional rought?—I don't think so.
- 39. Q. Yoo could not dig a tank in that time to atilise it. By the time thatank was dog it would be over?—Yes.

  40. Q. (Mr. Muir-Mackensic.)—I was just coming to that; could not they be induced to make tanks ready in good years to protect thamsireed a bad years?—Yes.
- 41. Q. Would not an energetic officer advise them to do so !- Yee.
- 42. Q. You are canfident that it would be of mea to them in a bad year?—Yes.

- 43. Q. How many times would a had year be likely to come from of That is very difficult to say. The Burdwan District seems to be getting dry.

  44. Q. You are coming through adry cycle perhaps f—Yes, perhaps the improvement in health and everything class shown that the district is direct than it used to be.
- 45. Q. Are yee quite satisfied as to the persons to whom the advances are given?—There has been no trouble in recavering the sums that here been advanced.
- 46. Q. Have people any trouble in getting them ?- Not on good security.
- 47. Q. It does not take a long time ?-It lakes time to make the necessary encurries.
- 4. 4. It uses not take a long time?—It lakes time to make the necessary enquiries.

  48. Q. (Alfr. Rejaratea Mudaliar.)—The Commissioner of the Surdwan District says in account to question No 5 that tenants, as a role, have not got good enough scourity for Covernment; do you agree with that view?—Yes, I think I would on the whole.
- 49. Q. Are they not occopately tenants in the Burdwan Dietriot P-Yes.
- Distribut 1cs.

  60. Q. It they are occupancy lenants, what is the difficulty about security P-I do not know what the Commissioner's reasons were. Perhaps be meant the character of the people; you most absolutely he sure of your security, otherwise thry will take advantage of you.
- 51. Q. You ran sell him up under the Looms Act?— For advances, yes. As regards the advances, I here per-sonally seen there has been no difficulty to collecting, but I have always taken good security.
- 62. Q. What security do you take? Personal security?— The value of the land. The lond is pledged as security.
- 63. Q. If this is not considered sufficient, you can insist open the applicant for the loan producing other sureties?

  —You
- 64 Q. So there is no difficulty as regords scentity?-Not if the tenent is a substantial man.
- 55. Q. During the post ten years Rs. 37,415 have been advanced as learns for the construction of 110 tanks. This is given in the statement received from the Bengal Government. Do you hoppen to know ie what condition these tanks over Y-No, I cannot say. The loan is advanced and the man makes his tank.
- 56. Q. How do you find out that the man does make the tank, and does not misappropriate the money?—If he misappropriates the money, there is a certain peculty—a summary procedure provided
- 67. Q. Do you reelies my revenae under these tanks ? No. I don't think eo.
- 68. Q. Do'yon know if any odditional aree has been brought under irrigation in tals was?—Sense additional area would came ouder every new taok, I should any.
- 59. Q. Io one of your answers you gave 6,913 ortes as being irrigated?—Yes.
- oring impareur—res.

  60. Q. In the statement received from the Beogal
  Government 18,872 serva are chawn as irrigated from canal
  works; can you explain the difference?—No. I cannot
  explain; the figures I gove were amplied as by the Distiet Romal.
- 01. Q. The figures 18,872 are possibly the ten years average?—Possibly.
- 62. Q. Yon said the grass ennual erop was 527,000 and odd; the statement given by the Gavernoont of Bengal gires 128,000 and odd?—I cannot explain the figures.
- 63. Q. The Bridwan District appearently requires fload enthankments; can you say why the bund which existed so the couth hank of the Damoda was removed?—I understand it was removed because it was found that the rirer was sitting up. It was therefore decided to remove this embarkment and let the water govern a crivin area to the sooth. This was the lesser of two evils.
- 64. Q. (Mr. Nwir-Mackensie).—Can you give me ony lides of the number of these small tanks; are there two or three, or set there are two or three or set there are two or three or three or three.
- 65. Q. Would not wells be the cheaper way of irrigation?—No. I do not think the people care for wells except at Raniganj.
- 66. Q. Hew for below the surface of the ground in the water ? How high have they to lift the water ?—Three or four feet.

B. Foley.

6 Nev. 02.

B. Faley. 6 Nov. 02.

- 67. Q. How hig is the tank generally? Does it cover two nr tured acres?—It is difficult to say; the size of a tank varies very much; generally they are one end a half to twa
- 68. Q. Have they lifto an all eides of a tank?-Gonerally one ar two.

60. Q. What sort of lifts do they gonerally nso?-A-cat-shaped dug-out instrument known as a donga.

To. Q. (Mr. Allen).—Woold you say that those tanks are primarily for drinking parposes or for irrigation?—Most of them have been dug for irrigation. One is sometimes dug operally for drinking water. A zamindar ar patnider makes and necessionally for the heacht of the people.

And the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of t

15 10

1. Q. (The President.)-You are the manager of the Burdwan Raj P-Yes.

Kapur.

- Kapur. 2. Q. I suppose you knew the whole district very familiarly?—I cannot say I knew the whole district very familiarly, but I knew it partially.
  - 3. Q. You say in reply to question No. 6a that there was a partial famine in 1865; famine in 1874, scarcity in some parts of the district in 1885, and severe searcity not amounting to famine in 1807-98. Do you think it was really a famine F—In 1865 I had nothing to do with the famine myself, but I found out afterwards that the Maharaja of Burdwan open large sums of money to relieve the distress of the people and that there were famine and ecately.
  - at the people and that there were famine and ecarcity.

    4. Q. Do you know how murb was spent.—Rs. 60,000, and there was no Govornment aid opened as far as I am nware. In 1874 the Maharaja opened relief works and I had obarge of these relief centres myself. I know that there was famine as well as ecarcity and accessed lives were lost. We ondeavonred to eave them as much as possible, but it was impossible to save every life.
  - 5. Q. How much did you spend in 1874 P—In 1874 we spent money in two ways, and certain sams were speat as subscriptions and certain sams in his own charitable centre. The sum given as abbscription was a subscription to tres. The sum g
  - the Government.

    G. Q Was it n very large snm P—No, probably about Ra. 25,000 or Rs. 30,000 During the searcity of 1885 we also opened some relief works and doled out rice, sait, oil and also supplied come facil for cooking parpeas. We also had some kitshens opened in certain pisces where they were wouted. Similarly in 1897 we had relief centres in two pieces. In one of them there nero some deaths, but it so happened that these were among the people who came from other districts. We had a centre upon the Grand Trunk Rord which is used by persons travelling from all districts, as there was accordity.
  - 7. Q In reply to question No. 9 as in what general measures should be adopted, ynn say that there is already a canal in existence in the Burdwan District called Eden Canal, which serves portion af Burdwan and Hooghly Districts P—This should be Improved and the excavation and re-exravation should be amounted. tion should be ene onraged.
  - 8. Q. You advocate mreting the deficiency by making a weir. Are you extlasted that the people will take water every year?—They take water every year, but the quantity
  - 9. Q Are they prepared to pay for it every year?—They barn entered into long leaves, and they will have to pay whether they take the water or not.
  - 10. O. Of course a weir aver the Damada would be 10. C. Or course a weir aver the Immana would be very expensive. It is estimated in east aver 8 lake of rapees If that was carried out, do you think there would be very large increase every year?—The capacity af the Eden Uand will not allow at a very large increase. I don't particularly advocate a woir; whot I say is that some means son be devised to acopyly more water.
  - eon bo devised to supply more water, are you satisfied it will be all taken np?—I have stated that in my answer. At precent they have entered into long leaves, but they do not get the water. It you are to supply water, you want anfiliests water in the canal. At prevent people enter into long leases with the sole object and idea of depending solely upon the Irrigation Department, and they hope they will get the water as they require it. Bot the Irrigation Department have heen unable to supply water, breake facilities don't exist to allow sufficient water to go into the canal. There are many comploints, and probably soom of these days three people will be launching suite ogniest the Government for dayses.
  - 12. Q. In the meantime will they give up these leases?
    —I don't think ao. Men live in the hepes that if they don't get the water in ane year, they may get it in the next foar years. I don't think they will give ap the leases.

The second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second secon

- 13. Q You don't think in ordinary years there is onough rain water to get on without irrigation?—If there was sofficient rainfall we could, but we do not get it in the proper time. We do not get rain in the months that we require it and we get more than we want at ather time. Moreover, the people like to start their oultivation as early as they can if they can only get the water for irrigation; evan to grow their seeds they are willing to take it. (Reads from paper).
- 14. Q. I don't quite sea what the read cess bee got to do with it. Of course they don't wish to pay any more if they cannot get any benefit, but if they are going to derive any benefit, they will pay whether rayat or zamindar i—If they get heacht.
- 16. Q. One spends money with the abject of gotting advantage ?—Yrs, but the zamindar also considers whether the rayst will give him any increment as the reat to make him was him pay
- 16. Q. Will the zomindar himself not go to the appense to ensure irrigation ?—Generally they are not in a better condition. Unless they combine they wou't do it.
- 17 Q. Is there n great deal of irrigation effected by
- tanks i—Yes.

  18. Q. And in the dry years I suppose these tanks run dry?—They all dry up. I don't mean there is not conficient water for them to wash their hands and feet; what I mean there is not enough to irrigate in the years of cevero drought. These tanks shoold be divided ion three alasses—the larger tanks, medium tanks and small tanks. There are neveral tanks which are used for dricking purposes, ond there are tanks which are stuated in the centre or larder of the field which are used for irrigation parposes. Them there is a third class of tank which is generally called "Dobss" or "Khirkeopukar" which croatfached to almost every bone in Bengri and are used by notive ladies for washing their pots and paos in and washing porposes generally.
- 19. Q. How much irrigation do you get from ony nuo tonk f-That depends upon many things—the size of the tank, the depth of the tank, etc. I am not take to give ony opinion, but I know this that each tank can irrigate a large
- 20. Q. About a bundred bighos ?-More than that,
- 21. Q. The woler is all lifted f-Yes; they either lift it or they ent on embankment in allow the water to run ant.
- 23. Q. Then these tanks are not altogether under-ground?—They cot ombankments only where tanks are situated on a slope, or na higher ground. They also oso the balling system.
- 23. Q. The people don't use wells ?- In this part uf the country they do not, but in the Bankura District they du.
- 21 Q. The Raja has got property in the Bankura District t—Yes, the Raja has got property in 10 districts, but the corpus of the estale lies in these five districts— Bandwan, Bankura, Birbhum, Hooghly and Howrah.
- Bardwan, Bankura, Birbhum, Hoeghly and Howrah.

  25. Q. In reply to question Nos. 9 and 10 you say, with regard to the obstacles to irrigation works, that the imporerished condition of the country interferes with their extension, but if concessions af the kind granted in 1874, numely, a remission of one-third of the one advanced, are allowed every year, zeminders and tenants, both alike, might be induced to excavate and re-excavate irrigation tanks and wells; you can hardly appear the Government to do that?—Yes, I do, and for this reason that when there is a famine the Government do not healtale to spend huge sums of money. Then why not opend moosy and take this precaution of provention. A few recommendations which have strack me I have put together. In my note some amount af ninney should be allotted every year and some saw tanks should be excavated for the purpose of staring water.

28. Q. Do ir his i-I the State times then Hinda Ly-nunerous at the own a and iri-2. 11 Q. 1

Est.

26. Q. Do you think that the district funds should pey for this?—I stated in my paper that it should come out of the State, Imperial or Provincial Funds. In former times there were Baselani tonks during the period of the Hindu Rajas and Mahamedan dynasties when there were numerous tacks all over the country prisoipally occavated at the cost of the State for the scopply of water for drinking and irrigation purposes.

27. Q. (Sir Thomas Higham.)—People take long leasen in order that when critical times come they will get water, but at such times they do not get water?—Yea.

but ni such times they so not get which reless.

28. Q. Why do they go on taking long leases ?—Because they are hoping to get water. If one one takes a long lesse, the pays five among per bigha or one rupeo per area. If he takes a someon lease, be will bere to pay more. Peopla like to be sure that they will get water for five years at a cheap rate, because of present the rainfall is becoming acuatier year by year.

29. Q. Bet they do not have to pay for a year in which there is plenty?—They will save on that year, it is true; but when he is in need of water he might not get it, and to avoid the disappointment he wants to be assured of his getting it. That is the reason he wants long lenses, but he takes a lease for five years and ensures getting the water for that period.

30. Q. When the water-apply fails, as It has this year, is there may ramission of the water-rate?—No, not that I know of.

31 Q. Should it he given ?—My own opinion is they should got nomission. They got sufficient water, whose lands are close. These have the advantage of getting it first. Those further off get it last, so that the tenants fight at the time as to who will get the water first. The men would poy oven 8 annas per bigha, or Ro. 1-8 per acro if they were sure of getting the water in time.

32. Q. Have you ocen the opinion sent in hy Raja Peary Mohun Mukerji. He does not hold the same view as you do?—Opinions differ. His opinion is not mine.

33. Q. But these people regard it as of great hardship that they have to pay an annual charge for water?—I think the Irrigation Department will be able to satisfy you that be himself wants water for irrigation.

that do ministr water water for integration.

34. Q. They want it in seasons of drought !—Of course there is always a blank oud a bright side in everything. If we take u long lease la good years, we do not want the weter, but we must pay for it. I have seen Raja Perry Mobon Mukerji's vlow, but I do not agree with it oltogether.

35. Q. With regard to the difficulty that owners are said to here in recovering water-rates from their tonants. Whon owners take long leoses do they find any difficulty in recovering water-rates from their tenants P—Yea, there are some difficulties. I have token a loase for five of my Khas Mahals and I paid the money first, but my difficulty is to realiso from my tenants.

36. Q. Why do not the tennals ray?—Tenonis will gladly ray if they are sure of gettleg woter.

37. Q. When they get good crops will they pay?—Yes; lost year they have suffered and this year they are going to suffer ognin.

sulfor ognin.

38. Q. If the supply is good and there is a good crop, there is no difficulty between landlord and tonant ?—But please remember the landlord bos difficulties in realising either rent or water-rate. He has not your cheap means af realising. His difficulties remain the same whether it is a good year or u bad yeer. Some teaents will not keep back a farthing, but the majority will not follow that rule.

39. Q. If they get a good crop, they do not make n fines?

The chances are that they will pay. We cannot eject a troublesome tenant and cannot remove his nome from the lease, and will have to suffer for the full five years.

40. Q. Arc acason leases applied for by the zamindars or the tenants ?—In some cases by zamindars and chiefly by a combination of tenants. No leases nro granted to individual persons unless they are men of substance. Gonerally 5, 10 or 13 tenants have to join together to get

41. Q. What is the size of a block?-It differs very

42. Q. I think it is in the hands of the Sob-divisional Officer P-Chiefly.

43. Q. Do you think a great deal can be done by keeping tanks in order ?--Yes, I think so. I hove udvocated that.

44. Q. How long does it take for a tank to ailt up P-I all depends. If properly dug, it may not silt up for 25 or 80 years, and it does not require any numeric cost of upkeep.

45. Q. When a tank is silted up what is the best thing to do; clean it out ognin, or build a new one?—It is obenper, much chenger, to clean it put.

much cheaper, to clean it out.

48 Q. When the tank is filled up the bed is very good for antitvation?—That is quite passible; some old tonk hede are so used; but people generally re-excavate old tank in preference to meking new ones. Moreover, most of these old tanks, which were made negs ogo, are on the best sites which command the fields and are very suitable for conding down the woter for irrigation purposes.

47. Q. When people clear out tanks du they use the silt for their fields?—Yes, in small quantities. It benefits very much if any one undertaken the cest, but very fow people care to do so.

people care to do so.

43. Q. When you clear n tank will the people come and remove the silt for the purpose of improving their fields?—

Yes, sometimes, but you have to pay for the labor and this is a deterrent: no n general rule, when we dig tacks, we take up the silt and put it on the embankment, and this being very good soil, we grow plantoine and pumpklus in these places.

40. Q. I suppose the tanks want clearing out once in every faur ar five years ?—No, once in 20 or 25 years; they are never excavated before 20 or 25 years.

50. Q. It takes 20 or 25 years to silt right up; you could clear it out when it has got anly a foot of silt?—Wo do not do that; it is very expansivo. Wo naually wait until it has lost the capacity of holding fresh water for irrigation; that is our criterion.

Salon; that is our criterion.

51. Q. Docait not often happen that there are men who wish to make a tank, but connot make it hecause they cannot get the land for it?—In same villages that may be the case; sometimes it happens that o man has get money, hat has not get the land. Some here land and have not money,

52. Q. A man has to get the permission of the landlord to dig a tank ?-Yos.

53. Q. But is not the landlord olways very willing to give permission?—That depends upon who the landlord is, Samelianes a landlord will be very glad to give up land for a tank, and sometimes he will not. It oll depends open the purtlemlar person.

the purticular person.

55. Q. Can nothing he done to incilitate the acquisition of land for private owners P—Private owners cannot acquire the land. It is only Government who can acquire I don't think Government on acquire for private owners.

55. Q. Do you think it would be advantageous for Gov-ornment to acquire it?—Yes; if anyone wonts to make a tank and does not get the lend, it would be much better for Government to acquire the land and moke it over.

56, Q. Of course that would require on unendment of the present Lond Acquisition Act?—Probably it would; but I am not sure whether the present Act would not cover

57. Q. Do you think it would be a good thing for Government to do that !- Yes.

58. Q. If n man applied to the Collector, stating that he wanted lands to make a tank, would be get bim the land for it?—Yes, probably be could.

59. Q. (Mr. Muir-Mackenzie.)—What kind of work did you give relief labourers ?—Chiefly digging out tanks.

50. Q. (Alt., Alunr-alaenemics)— when kind of work did you give relief labourers?—Chiefly diging out tanks.

60. Q. If tanks are so useful for irrigation, wby did not you employ them for irrigation?—We are very peculiarly situated; we have leased our land in perpetuity; we have no direct management, and unless we have direct management we do not spend money on irrigation.

61. Q. (Alt., Rejaratina Aludaliar.)—Would it not pay to construct irrigation works and get enhanced reut?—Well, there is a system in voguo in the Raj called the putni system. The Government has actifed the land in perpetuity moder the "Permanent Sattlement Act," and the zamindor in his turn has leased out the property under a lease called putni, and we there are astiled in perpetuity, we cannot raise the rent by a single pice.

62. Q. Saraly ym can by providing irrigation to non-irrigated lands?—We annot do so unless we are asked by putnilar to do so. Glernelly the putnilars da not want us to interfere in any way. We would be only too glad if they came forward and asked us. Within the last 17 years of the Court of Ward's management I do not know of a single instance of putnidar coming forward to make each a request.

Raja Buil Kapur.

- - 64. Q. Do you offer any encouragement to the tenante to construct tanks?—Yes, if it is on the property under any direct monogement, you must divide between such properties and those on putal lense. As regards not putalize, we don't encourage onything. The putalidar loss number of tenants noder him, and he has power to take an enhoused rest from them. rent from them.
  - 65. Q. Have they power to onhance rent?—Yes, they do hat under the present law how for they have power to enhance I do not know.
  - ontanes I do not know.

    66. Q. Does the Bengal Tenancy Ast npply to your land?

    —Yes. These middle-men know how to go ebent enhancing rent. For instance, n putnidor who may all. 2,000 has an annual profit of Rr 12,000. I nm not enmplalming. I like to see that my tocante are rich, but I only eay this to show that they can enhance rent while we cannot nake a farthing. Under those circumstances you cannot ask nat to spend money on irrigation to benefit them while we get nothing. I think that n remission of one-third of the loan should be given as in 1837 as an encouragement in the people to take land and excavate tanks.
  - 67. Q. Do you think that will be foir to the general tax-payer?—Strietly speeking, I don't think it will be nufair; you have in spend vast arms, then why not spend some money for presentive works? The zamiudar is also n tax-payer, and when you had famino we also outseribed.
  - 68. Q. This is private generosity 9—Then this would be State generosity. The State ought to be more generose then private zamindors.
  - 69. Q. How much money has the Siniospent in this woy during the last ten years !—I can't say exactly.
  - 70. Q. Suppose the State remits the Interest nuly ?— We remit interest on the onm advanced. The State might to do something more.
  - 71. Q. Io it a very large sum?—Hitherto the practice has been to spend only in years of concity. Advances should he made now in ordinary ceasons. Ynn hove just now heard the Collector say that he advanced only Rs. 1,600 ar 2,000 annually, which is a very small sum; we ourselves spend more timn that nunually; this year we have spend Rs. 12,000. I have advocated that advances should be made in each year to safeguord against famine.
  - 72. Q. Do you give the condrainces in tenonts or put nidres?—As I mentioned just now, I don't give a pie to the
    pot nidars. It is only to the tenants of the cetates that ore
    directly under my management. I am not going to pry
    n pice for his benefit unless hoosks. If he spends 12 annus
    and asks me to give him 4 annas, I will be very glad to do
    it.
  - 73. Q. (Mr. Allen.)—Can you tell whot a tank costs to make?—It depends upon the size.
  - mato?—It depends upon the size.

    74. Q. Say one about 3 bighas?—About two theesand rupees, but even here it all depends upon the depth and nature of the soil. It it is hard soil, it will cost more. If you neet with a spring suddenly, the cost of bailing out the water will be great; generally for a tank of about three bighas, Rs. 1,500 to Rs. 2,000 will be quite sufficient.

75. Q. Is the excavation of n silted tank an expansive matter? What will it cost to excavate a fully silted tank of that size?—Say half the amount. There also it will depend upon how most it has silted np, because some tanks have silted up as much that they have been tarred into paddy fields. If it is its alted up, the cost will be in provertion. portion.

31. Q.

1143 teleur -

4304

- portion.

  76. Q. You epoks about the advisability of the Government giving an ard of the tokens loan as a premium against famice. I suppose the femius expenditare in Burdwan since 1892 has been very little?—Very little. Burdwon has been fortunote in that respect; if there is no famine, I don't wont acything.
- 77. Q. What measure do you adopt? Do you toke long leases from your tenants?—I don't take ony leases from them. I simply write the nome of the tonant and wake it over to the gomenta to realise from him. First of all they must send in a patition, then I take cetion.
- 78. Q. Have you been certifying these amountage due?

  Le coch coses where I was forced to I collected by suits.
- 79. Q. Is it the practice in Bordwan to charge a tenent salomi if he makes a tonk ?—It all depends upon the noture and hebit of the loudlord; we never do it; come landlords ne doubt de se.
- 80. Q. Do not some londlords object to tanks being og ?-If it is for irrigation purposes, I don't think be will ojret. object.
- 81. Q. As a matter of foct, rent is not charged for tanks ?—Some ront is charged.
- 82. Q. How would the rent of n tank compare with rice land P-Supposing there is a tank of 4 bighas, we charge only 4 nances simply to have a nominal rent, jost to differentiate between rent-free and rent-paying land.
- 83. Q. Whot would the charge he for the same erec under rice?—It would depend upon the loy of the land. Generally speaking, it would be obout two rupces per bigha.
- 81. Q. You told Sir Thomos Highom that the land should be acquired under the Land Acquisition Act. Under that Act the owner get 15 per cent. arer the market value would not the roynt find that expensive P—Yes, but if he wants the tank, he must pay for it.
- 85. Q. Still he would have to pay 15 per cent. over the market value?—There is no bely for that; if he is desirons of having the tank, he must pay.
- 86. Q. (Mr. Muir-Mackrazie.)—You said you give odrances; what do you give them for ?—I give some for the improvement of their tanks ead chiefly for buying seedlings and sopplying themselves with implements for caltivation.
- 87. Q. Very little for improving tanks ?-Whatever they ask for.
- 83. Q. They don't oak for much !- No.
- 88. Q. They don't set for much! ?—No.

  89. Q. Do you think then that, if there is plenty of muney made available, they would ask ?—I am sare of it, because the taken advances, os I have already said, are generally made in years of searcity. If the people are told that they can have money from the Collector or District Board, as I have added in my note, you will make thom advances, and give up one-thind or whatever proportion may please Government, the chances are that the mojority will come forward and take advances every year.

  90. O. 187c. 181c. —You proke of an agent of 100 bigins.
- 90. Q. (Mr. Allen.)—Xon spoke of an aren of 100 bighus being irrigated by one tonk; what sort of tank?—A tank of one or two acres would irrigate about 300 bighas.

#### WITMESS No. 63 .- BARD HART DAS PAL, District Englness, Burdwan.

Bobn Hari 1. Q. (The President.)—You are District Engineer of Due Pal. Burdwen?—You.

2. Q. How long hern yon been there?-Nearly 11 years; 6 Nov. 02. since 1892.

- 8. Q. During that time hove you seen many had years?

  —I have seen two years of scarcity; a purtled famine in
  1893 and some scarcity in 1899.
- 4. Q. Do you think there was anything you could really call it a fourine?—No.
- 5. Q. Had you relief works?—Wedid have relief works.
  They were not hage. We opened relief works to excavate tanke, and did some village road-moking to relieve the villagers in these ports.
- 6. Q. In your ofotement which we have only just got this morning and have not had time to see through, you say that the area irrigated by private irrigation works, such as wells and tanks, is about 12,0000 acres P—My idea is that, of the total area, about our per cent. of the lond is commanded by village tanks. In years of drought these tanks ere not full.
- 7. Q. Do they get any benefit still from them P-Yes, n little.
- 8. Q. There must be a greet number of tonks? -Yes, there are a great number in each village in the cultivated
- erea.

  v. Q. Da each of these funks irrigate a larger area than itself?—Yes. Many of these rayats have the right to

of a silved lark as expensive to communicating the dank and the first three danks it will be the first three danks as silved as how home to be the first three beauty and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and the first three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks and three danks

-B-!-In: of the Chiefeld

berram his ro the right to irrigate their field from certain tanks, but in years of drought they do not get the foll benefit.

10. Q. Do you think that a took will irrigate five times to men P - I am not quite ours of that.

11. Q. Have you seen anything of the irrigation in the Eden Cacal ?—Yes. I have gone about the district and seen what is being done.

12. Q. Is the cirrigation in the Eden Canal very valu-ble to the district?—Yes, it is very valuable. It is much ued by the rayals.

values ny me rayata.

13. Q. Do you think that it abould be enlarged, and if it was colarged, would more land be irrigated?—If the supply was increased, it would command a larger orea than it does at present.

14. Q. They pay per sere for irrigating?-Yes, most of it is by lease.

15. Q. Thou I suppose they take water whether they want it very much or not, because they have to pay for it?—Yes..

16. Q. Do they make complaints about paying for leases and not get water?—Yes.

17. Q. Are the complaints well-founded?-Yes, in most

18. Q. You say in reply to question No. I (the question being as to what general measures should be adopted) you recommended extensive irrigation works as necessary; are they to be ondertaken by the Government or District Board, or both P.—Undor the Act the District Roard is not ollowed to do my, irrigation work. Until the Act is amounted they cannot undertake each work.

19. Q. Are you e member?-I am net u member. I am

the congineer.

20. Q. Do you think that the Board would like to have
the power and would they use it P—Yes, I think they would
like to hove it, because this is a sort of local work and they
would like to get benefit.

would like to get benefit.

21. Q. They would want more money?—Certeinly. My idea is that there are certain neves that are more liable to famines than others. A list of the tanks in these sreae might be made end o list of tanks silted up. An order might be passed that a register chould be kept of such tanks and the owners might be asked to re-excavate thom out of their own fands; and if they complain of want of fands they may be acked to take complain of want of fands they may be acked to take edvances from the Government under the Agriculturkis Leans Act; and if they decline to do it, such tanks may be acquired by the Government and reevenuted. Then the rayar may be clarged a water-rate. This may be one course of income which may be placed in the lands of the District Boord. I think they would be willing to pay. I think they would poy semething like 8 course 3 highs.

22. Q. (Mr. Muter-Mackenzie)—The man when the limits and the second of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of the course of t

22. Q. (Mr. Muir-Mackenzie.)—The men who get the ober?—Yos.

23. Q Has suyhody class to pay?-No; it will not be a general rate.

24. Q. Have you only experience of well irrigation P.—I bove seen only some kachcha wells in the district which are used for Irrigating only regetables and pulse.

25. Q. The people prefer tanks P-Yes.

26. Q. For diggieg tanks do they take takavi odvonces ow P-in some cases not much.

now r-11 some cases not muon.

27. Q. Why do they not take them freely?—Probably the system is rather complicated. They have get to apply; then some officer is deputed to sequire whether it is worth giving him the memory, whether the accurity officed is sufficient, etc.

28. Q. Do you think if the system was made easy, they would take advances more freely P—Yes, I think so.

29. Q Do they complain of the rate of interest !-- No. pover heard of such complaint.

80. Q. You say the system is very complicated ? -- It is not easy to get access to the Collector and to get advances under that system.

31. Q. (Sir Thomas Higham.)—Do you think a great deal cen be done by re-executing old village tanks?—Yes.
32. Q. Where is the mency to come from?—From the Proviocial Rusenne.

33. Q. Hove you any idea how much water is required for flooding an acre of land? —Semething like 14,000 cubic feet for a depth of four luches.

34, Q. What will it cost you to remove that 14,000 cubic feat of silt ont P-Rs. 75.

85. Q. Then you must pay Rs. 75 for getting stomge for B thu Har i one occe?—Yes.

26. 9 core? — X cs.

36. Q. How can they shord to pay water-rate and interest on that? Do you mean to say that the people would pay interest on that? What will the interest on Es. 75 come to?

—It will be about Rs. 3 whether they wout the water or

S7. Q. I don't see how they are going to berrow the money and pay interest?—If the villagero agree to pay, of source, they would.

33. Q. They cannot poy Rs. 3 an acre for clearing out the whis?—That is too much. Prebably they would he will-ug to pay 8 annas a bighde or Re. 1-8 an acre, the clauce Re. 1-8 being horne by Government.

39. Q. Then the remainder will have to be paid for from other source—by Government or by somebody else

40. Q. Is there any cleaning out done in the old tanks ?
—Yes, but not mosh. We see now and then one or two tanks cleared up.

41. Q. By the zamindar?-No, not zaminders, the

42. Q. Do they take the silt for manuring purposes ?-Th

43. Q. How far !- They carry by carts to their fields.

44. Q. Do they carry it n milc?-Yes, that they do.

45. Q. 10t they carry it mile?—Les, that they do.
45. Q. (Mr. Muir-Mackenzis.)—How much money do
District Boards spend on these works is years of searcity?
—About two or twelve thousand rappees.
46. Q. If the District Boards bad been spending that
amount of money upon the improvement of tanks, or in
making new tanks, oil this expenditure or a meterial pert
of it is the famine year would have been onved?—It is
again not certain whether o famine would occur is the same
place in case of drought; that is the principal thing.

47. O Wald were fault to search a salest more resident.

47. Q. Would you find it easy to select meny sites for new tanks?—Pleaty of sites. I do not know whether owners would give the lands free of cost, or whother they would have to be ocquired.

48. Q. Most of them ere ecoupied by old tanks !- Not

49. Q. How is the irrigation brought, by lifts ?- Yes, es one to three

50. Q. How bigh is the lift !- Three to four feet.

61. Q. You must here to lift nine or ton fret by succeedive lifts?—Yes.

53. Q. (The President.)-For rice irrigation ?-Yes. 63. Q. (Mr. Mnir-Mackenzie.)—That is not done aroughout the whole occson?—No.

54. Q. Only when the crop is le c criticel cendition?-Yes. 55. Q. Mr. Horn has soid that in this district of Burdwan ries has never been known to fail entirely; is that true?—Of course there are certain years that are weres to some crops. There is no regular failure over the district. There may be a partial failure.

50. Q. What is the lowest oreps you have ever known in the district ?-I think the arounge is 8 causes.

57. Q. (Mr. Rejaratna Mudajiar.)—With regord to existing tanks, collivators pay a rate which luclode a certain charge for water?—I do not know whether they pay ony rote, but they here a right to water from some villege touts.

58. Q. They pay rout which may be precamed to include it?—Yes, these rates have been fixed many years

age.

50. Q. Do you think they can joedly be called upon to pay a higher rate if an old work is restored?—Yes, but I do not know whether they will agree in every case.

60. Q. Would it be fair; they are outified to water end held the land at a certain rent?—Yes.

61. Q. If a tunk was silted up and the owners did not clear it, could the tenants sue the ewners?—I do not know. I have never heard of such sails.

I have never heard of such suits.

62. Q. You said the District Board spends ten or twolve thousand rapes on extring works. They are not for frigation works?—They semetimes use it for irrigation worls?

63. Q. Bot they have no power to spend money on irrigation?—They means it for drinking-water, but the rayests use it for irrigation and the Board cannot prevent it
